The Gobron-Brillie, which has two pistons in each cylinder, one going up and the other down when the charge is expanded between them, was shown in both fours and sixes. The six cylinder model, having twelve pistons, is externally very smooth and clear in appearance around the engine. It is equipped with a compressed air starting system, the pressure from which also may be utilized for inflating tires. Two water circulation pumps are fitted to the Hillman-Coatalen six cylinder, one to each set of three. The Hotchkiss light car of four cylinders has the latter cast en bloc, and the secondary ignition leads to the various cylinders are in different colors, so that wiring mistakes are easily avoided. The Iden and the Pullman are front wheel drive affairs, acting as fore-cars or tractors. Air cooling and belt drive by means of two belts to the rear wheels distinguish the O. T. A. V. cars that were exhibited. The air is forced through a cooling jacket around the cylinders, after the manner of the Frayer-Miller. An unusually strong gear box is mounted on the M. M. C. six cylinder and the propeller shaft is enclosed in a generous casing which comes up to the back of gear box, terminating in a ball and socket and acting as a torsion rod. Coil clutches were shown on a few cars, the Mors having this type, in which a steel band coils around the periphery of a ring forming part of the fly wheel. The Motobloc four cylinder engine, with the flywheel between the second and third cylinders, although not new, attracted attention.

Panhards were shown in their latest forms. While the three cylinder 8-11 horsepower remains about the same, the 15-20 has a clutch removed from the flywheel and back in the gear box with the transmission. Engine braking is permitted by a foot pedal which closes the exhaust valves and makes the motor work against compression. A compressed air self-starter is mounted on the 18-24 Panhard chassis. The Renault also mounts a self-starter. Porthos cars offer various combinations of pedal action to suit the customer. On the Straker-Squire the frame is flanged in the forward portion to form the engine bed. Roller guides on the Sunbeam, to prevent side sway with heavy limousine bodies, show an eye to modern conditions. The Valveless, having two cylinders communicating with one combustion chamber and twin geared crankshafts was the only car of its kind. A special pedal for braking the clutch shaft in gear changing marked the Weigel control and the Withers dash mounted a ratchet starting device, operated by repeated back and forward movements of a short lever.

San Francisco Show is Abandoned.

San Francisco will not have a show this season, the dealers having voted against holding a show, at their meeting last week. It was found that new models could not be secured by the second week in December, the date proposed. As the next available date was in February, the time of the last show, the dealers considered this too late and decided by a vote of 13 to 7 to not hold a show at all.

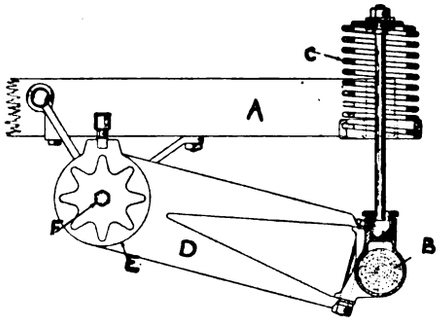
COUNTERBALANCING THE MOTOR

How It Overcomes Vibration, as Shown in the Brush Runabout—Application of New and Revolutionary Ideas.

Because of the thoroughly original nature of their design, no little interest centers about the construction of the two types of car produced by the Brush Runabout Co., Detroit, Mich. With the advent of the light runabout nearly a year ago, considerable attention was attracted to its general economy of construction and the ingenious manner in which it was displayed. With the appearance of the new twin-cylinder car of somewhat larger dimensions at the recent New York show, however, it was made plain that in addition to a departure from



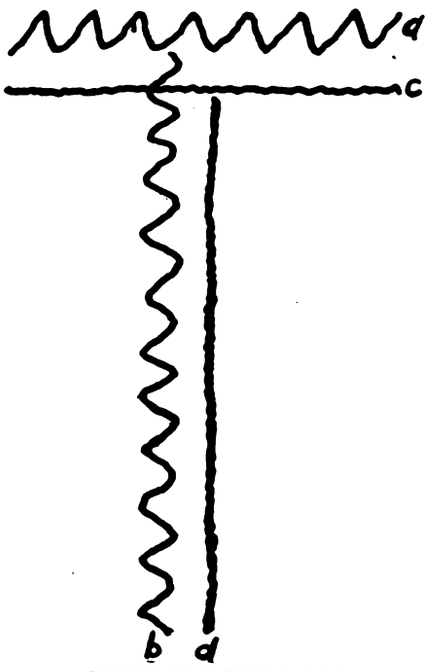
BRUSH BALANCE WEIGHT

many of the traditions of other automobile builders, the designer had developed one or two points which were worthy of study in themselves because of the radical and fearless way in which certain inherent difficulties of the average machine had been attacked.

No qualification of this statement is required when attention is called to the fact that the new motor is balanced in part by means of a revolving weight hung on a little shaft placed at one side of the motor, and entirely independent of any other mechanism, its sole purpose being that of establishing a beat of the proper time and strength to counteract the natural vibration of the motor. When the manner in which this contrivance has been worked out is further considered, it appears that in place of being merely a random effort, it is founded on a very rational idea.

The two connecting rods being coupled to a single crank pin, the pistons move in unison, an impulse thus being secured at every revolution of the shaft. At the same time, the amount of vibration developed in the essential organs of the motor, becomes practically double what it would be with the single cylinder motor of the same size and design.

Considering the pressures underlying this vibration, it may be said that there are three of sufficient importance to be treated independently. That is to say, one caused by the piston and upper ends of the connecting rods; one caused by the centrifugal force of the crank, crank pin, and the lower ends of the connecting rods; and one produced by the reaction of the entire motor, due to the turning effort of the shaft, which is, in effect, the tendency of the whole motor to revolve about the shaft, instead of remaining stationary while the shaft turns within it. The first of these forces tends to make the motor dance up and down in the frame; the second if unbalanced, would produce a constant rotary effect, since the weight of the crank group is constantly pulling away from the shaft,



BRUSH SPRING SUSPENSION

while traveling around it; while the third would tend to rock the motor violently in the frame, even upsetting it, if not counteracted in some way.

The method in which these three sorts of vibration cause are overcome is this: A weight, a, is attached to the crank shaft, c, opposite the crank throws, its combined mass being sufficient to counteract the pull of the crank group entirely, and to counteract one-half of the vertical force developed by the moving piston group. The addition of this weight, however, while removing a portion of the vertical force, also adds a new force pulling alternately right and left in a horizontal line and also, to a certain extent, in all other directions except the vertical. By using another set of weights of exactly the same size, set an equal distance from the axis of rotation, but compelled to turn opposite to this, it is evident that the remainder of the vertical force would be counteracted, and all other unnecessary forces as well. This, however, is impracticable in this connection, and although a second equal weight is used, it is placed on a countershaft, set at one side of the crank shaft and a little above the level of the main shaft.

As shown in the diagram, the secondary weight, b, concentrated in a single mass of metal, is mounted in an independent case at one side of the crank case, its shaft, c, being driven directly from the crank shaft by spiral gears. It will be observed that the elevation of the second shaft above the crank shaft, instead of resulting in an absolute counter-balance of all the forces under discussion, must result in setting up still another set of forces tending to yank or pull the motor around its shaft. Instead of being haphazard and unintentional, as might appear, however, the result is a deliberate effort to counteract the tendency of the entire motor to rock in the frame of the car. This it does completely, or nearly so, under conditions of average load and speed —these being the only conditions under which it is possible to compensate with an invariable device.

BRUSH VIBRATION CARDS

How successful is the result of this simple system, with its rather complex theoretical foundation, is apparent from the accompanying graphic records of the vibration actually produced in the car with and without the balance shaft. The records were produced by affixing a pencil to some point on the frame, corresponding to the center of the radiator front, in a general way, and causing a card to travel before it, first horizontally and then vertically. Evidentally any deviation from a straight line produced when the card is moved horizontally, must reveal in a general way the amplitude of the vertical vibrations, while similarly, the vertical graph, shows horizontal vibrations. In the accompanying figure, the lines a and b were produced by the machine with the motor running without the auxiliary weight, while the lines, c and d were drawn after the secondary shaft had been put in place. and with the motor running under exactly

Digitized by Google

the same conditions. The graphs, here shown are reproduced from actual cards, secured in this way.

While, as already indicated, every portion of the Brush cars is more or less revolutionary, perhaps, none is more strikingly so, according to the understanding of the average motorist, than the construction of the chassis proper, which is mainly of wood, stayed and reinforced with maleable iron castings. This construction is extended even to the axles, which, though reinforced by iron truss rods, are of selected wood, oil treated.

The spring suspension also is of particular interest, in that helical springs are employed in compression in conjunction with automatic shock absorbing radius rods. As indicated in the illustration, the frame, A, is supported by the spring, C, which rests in a socket bolted directly to the sill and is attached to the axle, B, by a rod in compression resting in a spherical joint. The casting which supports the spring link, also carries the axle end of the combined radius rod and spring brake or shock absorber D, which is bracketed to the frame, by means of the friction joint, E, adjustable by means of the nut, F. Four of these radius rods, combined to preserve the location of the frame over the axles, leaving to the springs no function except that of supporting the superimposed weight of the chassis.

The general specifications of the two-cylinder car include the cylinder dimensions, which are 4 by 4 inches; the rating, which is 12 horsepower; the speed range, which is 600 to 2,500 revolutions per minute; and the general construction of the motor, which embraces screwed-in cylinder heads, mechanically operated valves placed on the left side, tubular-connecting rods, and continuous feed floatless carburetter, which is supplied with fuel by a diaphragh pump actuated by the variations of pressure in the cylinder. The transmission is by modified planetary change gear, having but a single set of pinions, counterbalanced to avoid vibration, and double chain drive. The wheels are 30 inches in diameter, shod with 3½-inch tires, solid tires being optional with the purchaser; the wheel base is 88 inches, the weight 1,200 pounds, and the standard equipment, a runabout body, with rumble box seat or rear surrey seat, as an extra.

Another Compressed Air Automobile.

Another compressed air automobile has been developed—this time in Maine. The leading feature of its construction, aside from the fact that the air-compressor is driven by a gasolene motor, while the driving motor is actuated by compressed air, is the fact that the compressor is developed upon an alleged new plan of construction, the mechanism being mounted within the tank which it supplies. The heat generated by compression thus has a regenerative influence on the air on storage. A 50 per cent. increase in power is claimed to result from that arrangement.

CONTINUOUS LUBRICATING SYSTEMS

Their Advantages and Disadvantages in Comparison—Cost of Installation the Most Serious Objection.

Because they are no longer a novelty, force fed, continuous lubricating systems, as applied to motors, are no longer heard of to the extent which prevailed a year or two ago. Nevertheless, it is to be remarked that where such systems have been applied they have not been given over, but are retained as valued, if somewhat expensive features of the cars to which they belong. The principle is a good one, and as used in larger power plants, is reckoned as one of the most valuable aids to continuous and reliable operation.

The requirements of a running journal in the matter of lubrication, may be laid down in terms of so many drops per minute at certain rates of speed. The rate of feed as measured on this basis may be altered to suit any reasonable speed variation. But it serves satisfactorily only when certain conditions of alignment, bearing load, and quality of lubricant are fulfilled.

Regarding the flushing system of lubrication, it is an old rule requiring no demonstration, that a bearing never can have too much oil. The cooling function of the oil is better carried out when the supply is in eccess of the actual demand, the certainty of having enough for all actual requirements is assured, and the need of regulating the circulating medium with religious exactitude is eliminated. More than that, the factor of reliability is considerably increased, with an increase in the quantity of flow.

Among the possible objections to the principle, may be mentioned the increased cost of forming ducts in the crank and connecting rod members; the cost of the single continuous flow pump and the sump or oil reservoir in the crank case, as contrasted with the cost of the independent mechanical oiler which they generally supplant; the power absorbed in driving the pump, as contrasted with the power absorbed in driving the mechanical oiler; and lastly, the drawback arising from using the oil over and over instead of feeding perfectly fresh lubricant to each part. Of these, only the latter may be considered as of material import in cars of the better class.

Where a considerable volume of the lubricant is contained in the system at any one time, however, or where frequent renewal is insisted upon, no harm can result from the gradual deterioration in lubricating value of the oil as it passes through its circuit and is returned to the sump. The opportunity given it to settle there, as well as the purifying action of the strainers which always are provided, not to mention the continuous dilution of the oil by the addition of a fresh amount from time to time in order to keep the quantity constant, would seem to be sufficient to keep the value sufficiently constant for all practical purposes. Certainly in practice, no difficulty has been experienced, so far as is known, from this cause.

Generally speaking, then, the advantages of the system are greatly in excess of the disadvantages, except in the matter of first cost. This, of course, is not to be considered in large machines where certainty of performance is a primary consideration. That being the case, it is somewhat to be wondered at that the system is not more widely extended in use among the makers, and further, that it is not broadened sufficiently to make it include the gear case as well as the motor, since such an extension, while adding to the load upon the system, also would increase the amount of oil in service, thus reducing the frequency with which renewals would be required. Where annular bearings are employed, this would be superfluous, to be sure, but on the other hand, were ample lubrication always an assured fact, the use of these expensive mountings might well be foregone, except in cases where extreme durability and low bearing resistance was required, regardless of cost.

How to Increase Battery Output.

A very simple and effective method of increasing the output of ordinary dry battery cells is recommended by a motorist who is identified with the telephone business, and who claims to have adopted the same scheme in that line. It is merely to remove the usual binding post from the carbon terminal, break off the pole flush with the packing on top of the shell, and drill it out carefully to a depth of about an inch and a half. Afterward, a brass screw of about the same length may be inserted, or a specially made binding screw, equally long. In cases where this treatment has been applied, both to old and new cells, the amperage has been found to have increased to a surprising extent. In one instance, he claims that the original reading of 18 amperes per cell, was raised to no less than 28 by this means, while, as showing an opposite extreme, an old and run out cell which had given a 3 ampere reading, after treatment, gave exactly 7 amperes. As showing further, that the life of the cell is not necessarily reduced by this means, in one case a former vehicle mileage of 500 is said to have been increased to 1,500, with no other possible means of accounting for the alteration in performance. The theory is that the longer screw giving better contact, as it does, reduces the internal resistance of the cell, and so increases its efficiency.

GETTING ON TO THE NEW STYLES

Some Methods Explained in a Show Visitor's "Confession"—Stealing Measurements and Sampling Materials.

"I saw an article in the Motor World the other day about how all the makers of attachments take show time to measure up the different cars so as to be sure of having their stuff fit right when they send it out, and that's right, too. But there's a good lot of measuring of another kind, that you don't see done, and that nobody knows about except the men that do it and their bosses. Only you see the result, and wonder how it is that styles catch on so quick with a whole lot of makers scattered pretty much all over the country." The speaker gazed out of the car window for a moment, and then turned quizically to his seat mate. "Did it ever occur to you that about the only exclusive points on the average automobile body, are those you'd get rid of if you were having a new one made?" he said.

"You see," he continued after a pause, "it all goes back to the days when everybody had a horse and at least two wagons, and when the carriage builders had to scratch pretty hard to keep up with the parade. Now I come from Buggytown, Mass., and all the old line firms down there are turning gray worrying their heads about the automobile body game. And it's just the same way it used to be in the old carriage days. Let one man bring out something new, and all the rest would have it copied about as soon as it came out of the paint shop, or certainly before the end of the first show at which it was exhibited.

"How was it done? Well, that was something a good many builders wanted to know. You might say it was done whatever way came handiest.

"Why, in the old carriage days it was no uncommon thing to send a blacksmith to look over a job somewhere and expect him to come back to the shop and build a pretty good imitation of it on the strength of what he could remember from one good look and a few stolen measurements. The stealing was done in pretty cute ways sometimes, too, for it did not do to be caught with the goods. So when a man wanted to get the height of a wheel, say, he would go stand along side it and make a chalk mark on his coat, perhaps, and then go out and measure himself somewhere against a wall. Or maybe he would carry a bit of string with knots in it, and use it when no one was looking.

"Now those same tactics come into play with automobile bodies. Every show gets a lot of carriage men from all over the country, and Buggytown sends its share of them, too. Some are trimmers, some are blacksmiths, and some are painters, and they are all there for study.

"Why, last year, I had a friend along with me, and we measured the width of the seats of every job in the show, just sitting in them and passing a tape line across back of us. And we did a lot more measuring the people there didn't know anything about, too. My firm sent up a draughtsman who walked over the show with a cane, and I guess some of them thought he wanted to buy the cars, the way he looked 'em over, but if they only knew it, that cane was laid off with inch marks the full length, in little fine scratches. When he got home, he could draw plans for most anything he had seen, and draw them to work from at that. My way is to carry a program rolled up in my hand. Of course it isn't as good as a ruler would be, but when you know how long it is and have a pencil mark or two where the inches come, you can guess pretty close to what you want to know.

"But those little ways don't show a candle to what has to be done when you're really up against it. Now last year, there was one western firm had a certain kind of a button on all its jobs, and we couldn't find out where it came from or how it was made. It was new—that was all—and we set an awful store by new things, even down in Buggytown. Well, sir! The only thing to be done was to steal one, and I want home with one of those buttons in my pocket, just as sure as I'm sitting here, and no one saw me cut it out of a cushion, either. Many's the time I've slit open a little bit of trimming just to see how it was laid up underneath, and you can be sure it takes nice work to do it without getting nabbed at it, because if they catch you, you're liable to be shut up on most any kind of a charge. But they never got any of our boys yet.

"Yes, t'was a good show, all right," as the train pulled into South Station, "but I'll bet you most anything I got more out of it than you did, and if you was to give me a spark plug and a wrench I would no more know what to do with them than you would likely, if you should be told to spread your wings and fly.

" * * * All right, I will. And the next time you're down our way just drop in and see some of our 'New York' bodies. You'll be surprised to see how natural they look."

Tempering the Electric Light Bulbs.

Although the complaint is frequently heard that electric light bulbs are short lived, as a rule when used in automobile lamps, there is no need for this to be the case, provided only, that the proper precautions are taken when the bulb is first put into service. A foreign authority, who is responsible for this statement, also gives the precaution, which is merely to light the lamp and keep it burning for at least a half hour before the machine takes to the road. The effect of this is to harden the filament. If the hardening takes place while the lamp is free from vibration, there is little likelihood of failure.

DUTIES OF THE "TIRE ADJUSTER"

His Profession a New One Requiring Expert Knowledge and Business Ability —Diplomacy Also a Qualification.

Among the most modest and shrinking of all the many "experts" that the automobile industry has developed is the "tire adjuster," who is not, as one might suppose from the name, a person who can put on or remove a tire with superior skill, but one who adjusts the claims made by tire customers as to defects or poor service. He is a very new product and not all tire companies possess him as yet, but the larger ones have found him worth the big salary that he commands for his skill and experience.

With every tire concern, no matter how good its product, there are bound to be cases of dissatisfied customers who have either been unfortunate in getting defective tires or are unreasonable in wanting replacements for tires that have given their full expectancy of service for the condition under which they have been used. To sift the one class from the other and to make adjustments that will at once cost the company as little as possible and still keep the complaining ones friendly is the task of the "adjuster," a duty which requires for its successful performance a combination of tire knowledge and rare tact which is seldom met with in one man.

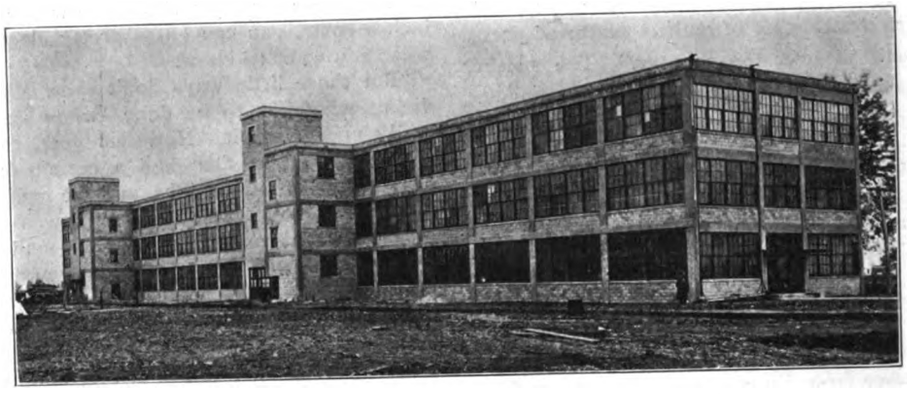
To make all adjustments as fair as possible and to give them some relation to a fixed standard, the professional adjuster in his judgments keeps two vital considerations in mind. Of these the first is the expected or normal mileage of the tires his company puts out, and the second is their gross cost at the point where they go to the trade or the retail customer. The mileage standard is an arbitrary one and may be three, four or even five thousand miles. It then remains for the adjuster to be able to tell by examination of a returned tire just what proportion of this mileage it has had and to deduct that proportion from any allowance that may be made. Thus if a tire on which the expected life is 4,000 miles shows by its appearance to the experienced eye of the adjuster that it has been run 2,000 miles before giving out from some defect in manufacture or material, the complainant is offered a new tire at half price, the latter being charged for the service that he has had from the old tire.

It is in correctly judging the mileage that the peculiar skill of the adjuster is given its greatest demonstration. While getting from the user as complete a statement as possible as to the time and mileage that a returned tire has been in service, and by means of its serial number checking up the record as to when and where the tire was sold, the adjuster is nevertheless ultimately dependent upon his own ability to tell its

Digitized by Google

mileage closely by examination. That the adjuster can really do this with astonishing exactitude suggests the training and experience which are necessary to hold the job. Every available avenue of information is used to assist him in his work, but back of it all there must be the actual personal experience with tires in road work and also the factory knowledge as to their manufacture.

Previous to being made the adjuster for one of the biggest companies doing business in the United States, the present incumbent was first a road driver using its tires, later a repairman engaged principally on the same make of tire, after that a retail salesman for the company, subsequently a wholesale salesman, then a branch manager for several years, and last of all, a factory man. During this period of years his experience with the one make of tire was enormous, and it all contributed to his present efficiency. In the majority of cases he is able to tell by the mere appearance of a tire just what amount of service it has had, and in cases of doubt, he can, by consulting the serial number and thus learning the factory lot and time of manufacture, make his calculations accordingly. Many angry customers, who have given mental estimates as to mileage far below the figures that the adjuster thought probable, have been brought around to agreement with the correction by a judicious use of pencil and paper, figuring their daily mileage and the time the tires were in use.



Not all tire claims are adjusted first hand by the adjuster, a good many cases being decided by branch managers on the spot, but all of these decisions ultimately pass under the adjuster's review. If the branch manager has made too liberal an allowance he is charged with the difference under the cost price of the tires, but on the other hand if he has saved the company money and has at the same time satisfied his customer, he is credited with the saving. In some cases, where the facts are perfectly clear to the adjuster, it is wise for business reasons to make replacement concessions that on the facts alone are unwarranted. The complainant may have a car which has been run hundreds of miles by his chauffeur without his knowledge, and to attempt to prove that such is the case might take more time and trouble than could be paid for by a slight saving in the adjustment. Similarly, tangles sometimes occur with big buyers in the trade, where in particular instances it is the part of policy to yield a little more than the facts justify. Such concessions, however, opening as they do some very dangerous possibilities and precedents, are only to be made in exceptional cases, and it is here that the trade knowledge and wisdom of the adjuster is called into play.

Quiet and unobtrusive as is his work, the adjuster nevertheless represents one of the most important and responsible branches of the tire business in its relations with the public and the trade.

THOMAS DETROIT NOW "AT HOME"

New Factory in the Michigan Metropolis Completed and Occupied—Ample Space Well Lighted Its Features.

By taking possession of its new factory and moving in, bag and baggage, the E. R. Thomas Detroit Co. has not only added to Detroit's already numerous colony of big automobile factories, but has given substantial evidence that it is not a mere "boarder" in the Michigan metropolis, but will make the city its permanent home. As will be seen by the accompanying illustration, the factory is of generous proportions and is three stories high. Its skeleton construction is reinforced concrete and the prodigal provision of windows is calculated to flood the manufacturing floors with light, the open location of the factory helping in this result. The interior arrangement of the various working departments is such as to bring the assembly along the length of the building in steady progress with a minimum of confusion and waste effort. In order to leave the floors unencumbered of stairways, the latter have been placed at the side of the building in structures of their own with open access to each floor. An ample site for the new factory, at Harper avenue and Dequindre street, was chosen to permit of subsequent enlargement when that may become necessary, and the completeness and quality of the plant equipment may be expected to have their reflection in the Thomas Detroit cars that will be turned out.

WHERE THE THOMAS DETROIT WILL BE PRODUCED

Apprenticeship to Develop Engineers.

What amounts to a high class apprenticeship system for budding engineers, has just been announced by the Daimler company of England, under the alluring style, the "motor scholarship." There are to be a Daimler major scholarships and four Daimler minor scholarships, the five students so enrolled to be given a two-year course in the shops of the company, together with theoretical instructions by graduate engineers, also under the supervision of the company. For the two years service, the holder of the major scholarship will be entitled to a salary of $500 per annum, and the holders of the minor scholarships, salaries of $100 per annum, a further agreement being entered into to the effect that the company may retain the services of the students after the expiration of their terms, and for a period of two years, at a salary of not less than $750.

A selection from the various applicants is to be made by means of an examination, to be held next July, Professor Sylvanus Thompson and Dr. Hele-Shaw having consented to conduct the test. A preliminary examination will be held in May, next, under the direction of the board of education, the most successful candidates being permitted to undergo the final and crucial test. The stated object is to develop men of ability who are desirous of entering the industry as a profession. The idea is an outgrowth of the difficulty already experienced by the Daimler company, in securing the services of competent persons in an engineering capacity.

Torsion Design for the Rear Axle.

In designing the torsion member of the rear axle, it should be borne in mind that in addition to the driving strains which it must resist, that is to say, the tendency of the axle to revolve with the wheels, an additional and frequently much greater strain is put upon it by the breaking action, which produces a similar force, appointed in the same direction. On several occasions, failures of torque rods have been observed, when after serving for a long time under ordinary driving conditions, a break down occurred at some time when the brakes were suddenly and forcibly applied. In the same connection, provision should be made for possible buckling of the torsion member, the layout being such that the action of the driving shaft and cardan joints will not be interfered with even in case of a considerable deflection of the rod.

PROBLEMS OF FINDING A MARKET

They Confront the Accessory Maker with Perplexity—Merits and Demerits of the Several Solutions.

How best to market and advertise his new product is the question that confronts many a manufacturer of an automobile accessory and the choice of methods is often one of great perlexity. Advisers there are in plenty who will suggest all kinds of things, and out of the mass of counsel and warnings the manufacturer must select a selling plan adapted to the peculiar characteristics of his product.

It is in considering his relations with the jobber and the dealer that the manufacturer encounters his first problem. The jobber comes to him as a channel for wide and thorough distribution among the dealers, offering a selling organization such as it would take the manufacturer himself a long time to build up and reaching dealers in frequent visits whom the manufacturers' own salesmen would find too remote to spend railroad fare on for recurrent calls concerning only one article. Furthermore the jobber publishes a catalog in which, if satisfactory arrangements are made with the manufacturer, the latter's products are illustrated and described, and such publication, it is contended, has advertising value and serves to establish a new article as something recognized and standard.

Opposed to such considerations the manufacturer has the active or latent fear that thus to entrust the larger part of his relation with the dealer to the confiding hands of the jobber is to put himself to a great extent at the mercy of the latter, so that in the event of a disagreement as to prices the jobber can threaten an entire and immediate extinction of the manufacturer's market by closing his usual channels of sale with an abruptness that would leave him helpless until he could by advertising and organization once more get in touch with the dealers and the public. That such an interruption during the comparatively brief busy season would be disastrous, the manufacturer is too keen not to realize, and it is therefore with no little misgiving that he treats with the jobber as to having the latter handle his goods.

Cold contemplation of the nature of the jobber's business also induces the conviction that earnest as the jobber may be in his representations as to what his large corps of salesmen could do in presenting and pushing the manufacturer's product among the dealers whom they visit regularly, there is the likelihood that among so great an array of lines as the average jobber carries, the particular article in question may not be the subject of that whole-hearted pushing and work on the part of the salesman that the manufacturer might be lead to anticipate and that such special energy as is imposed on the salesmen is for goods that the jobber has overstocked or on specialties of his own on which he makes a high profit. Thus if the merit of an aritcle were such as to bring it into rapid popularity the jobber would collect his toll and prosper on it with no very substantial contribution to the hard work of introducing it other than having it listed in his catalog and his salesmen's price lists, while if the market were against it his salesmen would simply forget it and as cheerfully take orders for some more favored line or brand.

To demand a large order from the jobber in return for giving him the line is to invite the unpleasant possibility of his later "unloading" at cut prices and demoralizing the market, while to demand nothing of the jobber is to permit him to share in a "good thing',' if such it prove, without adequate service. There are difficulties in arranging to take back from the jobber an "overload" on a mutually satisfactory basis. In the past it has not been an unknown experience for a manufacturer to find that under an agreement of the sort the jobber has ordered greatly in excess of his probable needs in order to get an inside price, and to have a big overstock returned at the end of the season. The hardship on the manufacturer in making up goods in excess of the market is severe, and to have almost a season's profits wiped out at the finish by a returning flood of overstock is anything but joyous.

These and other reasons incline the average accessory manufacturer seriously to consider the building up of his own sales force, covering by mail those districts where his salesmen would find it unprofitable to travel. If his product be high in price and with a good margin of profit this method would seem to be feasible. Examples are offered in the case of gasolene storage tanks, speed indicators and other products where each individual sale involves a comparatively large sum, proving the manufacturer's own selling organization capable of handling the business in a profitable way. Territorial agents or sales managers, working on commission, and supported by the factory as to advertising and printed matter, when well organized and encouraged, are often able to develop direct retail business that could never be reached through the usual channels of dealer and jobber. The product may be of such a nature as to require "educational" selling, or the presentation of long and complete argument by the salesman either as to the use of the article itself or as to why the customer should buy that particular kind as against other similar devices. If its price be big enough to warrant the personal efforts of salesmen in following up customers, the manufacturer can in this way create business for himself that the jobber or dealer can hardly hope to get for him.

Owing to the competition in the tire business, the tire manufacturers have not been content to leave the sale of their tires to the jobber, assisted by such advertising campaigns as could be carried on in addition, but have thrown their own salesmen into the field to go after both dealers and owners as well as the manufacturers of cars. Here again is a product running up into high figures for each individual sale, and because tires have to be renewed periodically, time and energy spent in winning over a customer brings big returns. So thorough and complete is the selling organization of almost every one of the big tire companies that the jobber can offer little in the way of territory that is not already covered, and as a result comparatively few tires are handled in a strictly jobbing way, the trifling extra jobbers' discount that is allowed being insufficient to cover the cost of handling.

On the other hand the great majority of accessories for motor car use find their marketing channel through the jobber. His catalog bristles with the popular successes, and his salesmen are on a busy round all the time with the dealers, taking their orders and seeing that they are supplied. It is manifest that the jobber is not a mere burden on the business who has reached his present flourishing state by falsely deluding the manufacturers into the belief that their goods must be sold through him or not at all, and an analysis of the reasons that influence established manufacturers in renewing their arrangements from year to year to have the jobber handle their goods reveals to the newcomer wherein the jobber may be of material assistance and benefit to him.

Credits is the field in which the jobber shines and it is this that establishes his importance in the selling machinery. In an industry so new and so rapid in its changes the matter of credits is as difficult as it is important. Most dealers demand time, both because their capital is comparatively small and because automobile goods run into money so rapidly that it is necessary for them to wait until they actually sell the goods and get the money before they can pay. For the new manufacturer to attempt to extend credit generally among the dealers is to be certain of losses, proportionate in number and amount to his lack of information concerning the history, habits and resources of each individual dealer. This knowledge the jobber has gained through his own experience and the many avenues of information that are open to him. His salesmen are ever on the alert as to credits in the towns they travel, and can act as collectors on customers who are slow. For the manufacturer who is not exceptionally well equipped to take on the burden of a mass of credits with attendant clerical work, correspondence, collection fees and losses, the simplicity of doing business with the responsible jobber is an advantage not to be overlooked, especially as the better jobbers discount their bills every ten days, and have commercial ratings that

Digitized by Google

are calculated to ease his mind on the question of whether he will get his money.

Only the strongest kind of a monopolistic position can permit the manufacturer who aims to do a large business throughout the country to deal direct with the retailers and insist on cash with order or C. O. D. delivery. Two objections influence the financially solvent dealer in not buying on this basis, and of substituting other goods whenever possible. The first is that in dealing direct with the manufacturer the goods are subject to separate and extra transportation charges greater than would be the case if they came in the regular shipments from the jobber with other goods, and that to order from the manufacturer entails the trouble of writing letters, the latter in the case of many dealers being the subject of a prejudice much more real and big than the reason that can be assigned for it. The second objection is that the C. O. D. system is an added expense, due to the charges for returning the money, while sending cash with order necessitates raking the cash drawer and buying a post office order or making out a check preparatory to asking for each shipment of goods. Then, too, there is that very human pride which the better class of dealers have in their honesty and financial responsibility, and which is offended by any policy which to their minds seems to assume them dishonest or financially irresponsible at the very start. That the manufacturer with a popular accessory which is in real demand can do business on this basis is certain, but that he greatly lessens his market and is handicapped by opposition on the part of jobbers and dealers, both anxious to push aside his products with substitutes, is equally certain.

In the earlier stages of creating demand and arousing dealers and the public to a realization of his existence and the merits of his product, the indifference of jobbers and dealers is a serious obstacle to be overcome unless a direct retail business is sought. If by heavy advertising the manufacturer has succeeded in engendering an interest among buyers, the usual course is for the latter to ask their dealers if they have the article for examination and sale, and it is at this point that trade indifference is transformed, either to trade opposition or trade co-operation, and one or the other the manufacturer must expect as he comes into prominence. The dealer, in the usual course, turns to his jobber to inquire as to whether the latter has it and as to its value and selling qualities. If none of the jobbers carry it or can quote him and he is not visited by a salesman from the manufacturer while the subject is fresh in his mind, the sense of probable profit will not be sufficient to impel him to write, and he will let the matter slide or tell his more persistent inquirers that he does not know anything about the article, but can show By the time the question has been fought them something that he does know is good. out with the dealer, as to cash with order and the like, only a very small part of the ripe "prospects" and possible customers are made into purchasers, their orders filtering through a reluctant dealer here and there or coming in direct by mail. The product may be so strong that its very merit alone will compel the dealer to handle it, but no matter how generous the discount, unless the price made him be one which he conceives is better than he could get by buying from the jobber or an "inside" over what other dealers get, he will handle it without enthusiasm, and subject to constant urgings from the jobber's salesmen to give his customers something bought with less inconvenience to himself.

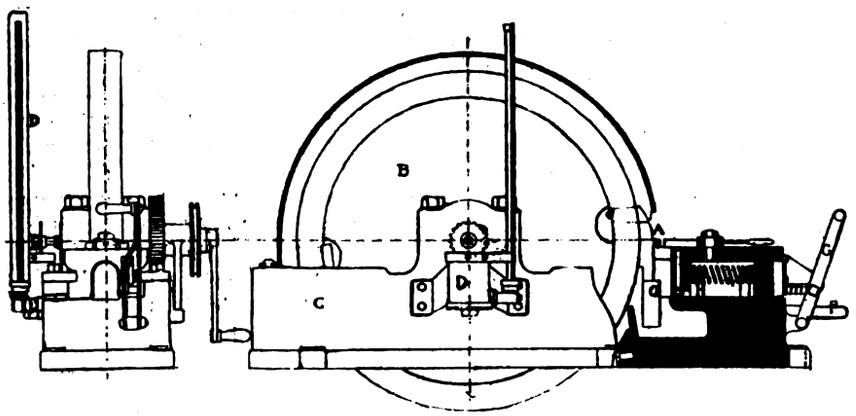
In history, play and story the greed and ruthlessness of the "middleman" in grinding down prices and by various methods reducing those from whom he buys to dependence on his wish or caprice has been portrayed until the "middleman" is popularly regarded as an avaricious interloper in business transaction, with a penchant for creating ruinous price situations and a disordered market. That the jobber of to-day, in the automobile supply and accessory business, will seek any price advantage that he can obtain is only too true, but paradoxically enough there is no line of goods that the better class of jobbers prefer to handle than the "restricted" specialties the prices of which are set hard and fast by the manufacturer himself. The "restricted" specialties are those upon which the maker or sales agent sets fixed prices at which they are to be sold to jobber, dealer and retail customer, respectively, and sees to it that they are maintained. Such a plan, when properly carried out, absolutely removes the manufacturer's bugaboo of slashed prices on his own product.

In many ways an arrangement of this kind with the jobbers secures the manufacturer more certainly against the evils of having his prices reduced on occasion than would a complete selling organization of his own. Should a jobber, in his eagerness for business, go below the set figures on a popular but "restricted" article, the salesmen of other jobbers would learn of it all too quickly and the manufacturer would almost immediately be in receipt of complaints from the other jobbers handling his goods and also of requests from jobbers not having the line that it be taken away from the offenders and given to them, as they would not be guilty of such bad faith, etc. With his own salesmen in the field, each anxious to make a selling record with the office or to make as big commissions as possible, the manufacturer is too often dismayed to find that his prices have been cut for large orders and that the men have undersold in each other's territory through secret and underground arrangements of one kind or another. Public head-chopping in such cases is of some effect, but it is difficult to get men who have learned the lesson as well as the jobbers have through multifarious experience.

By selecting but one jobber in each of the great natural divisions of territory and keeping his goods out of the hands of the notorious price cutters, the manufacturer is in a position to demand special support from those with whom he has placed his line and arrangements for circularizing the jobbers' lists of dealers and owners can frequently be made, the cost of the work being shared to some extent, according to its character. The "restrictive" price system that is recommended requires very careful thought, and the retail price should be set to allow for the discounts that prevail for the majority of the goods that dealers and jobbers handle. As an aid to detecting the channels through which cut-price offerings have come, the plan of serial numbering and of keeping records of shipments with regard to their serial numbers is the best that has yet been found, and it demands very little extra work from the factory shipping clerk. Whether the goods be sold through jobbers or through salesmen employed direct, the system is of value in identifying both the time and course of shipment of any particular lot or single piece.

Success for any automobile accessory or specialty, as in the case of any other manufactured article, is basicly dependent on its merits and saleability at a price that the public will pay and which will at the same time yield a good profit. Having evolved such a product and being in a position to make it in quantities, the manufacturer must determine whether he will cast his lot with the jobbers, so to speak, or whether he will fight their opposition or indifference and have a complete selling organization of his own. In considering this question he has to reflect on the nature of his product and as to whether it needs back of it the work of persistent and especially trained salesmen to successfully place it with the retail trade and whether the jobbers are not already loaded up with similar articles which by reason of lower price or other considerations would get better attention and more enthusiastic pushing.

When the Body Needs Strengthening.



When a body which has been in use for some little time begins to show signs of flexure so that the door latches have to be turned forcibly in order to draw up the rear of the tonneau and close a very appreciable crack, it is high time the ironing was looked after and strengthened. In some instances where wooden frames are used, it is sufficient to reset the screws which hold the irons to the frame, or to replace them with larger ones. In others it will be found necessary to insfal an extra bracket or two at the point which shows signs of the greatest amount of working. In any case, the structure should never be permitted to remain in such a condidtion that the latches are required to carry any material load; as they must do when the effect of engaging them is to close up the opening between the door and the lintel.

NEW DEVICE FOR TESTING STEEL

It Indicates the Exact Amount of Force Expended in Breaking a Bar—Details of the Mechanism.

Commonly speaking, all things relating to the production of iron and steel are looked upon as being too intricate for the comprehension of the average non-technical man. It is therefore not a little surprising to find that the methods of physical test, which are largely depended upon by the metalurgist in determining the properties of his product, are almost childishly simple in their nature. Nor does the nature of these tests and the apparatus by which they are effected become more complex in measure with the advancement of the science. A striking illustration of this fact is seen in the instance of the Guillery fragility machine, which was shown for the first time in this country at Madison Square Garden during the recent show, where it was staged immediately on its arrival from France, at the exhibit of the Carpenter Steel Co.

This device is, in effect, a form of impact machine, in which the test piece is broken by the first blow, the reading on a scale at one side showing at a glance exactly how many foot pounds of energy have been absorbed in effecting the rupture.

It is possible to break off a small notched bar of steel by means of a hammer, or by a weight swinging on the end of a pendulum arm, which traverses a known distance before striking the bar. With the primitive method of the simple hammer blow, nothing is known definitely except that the bar is broken by the shock. With the pendulum method, it is possible to calculate the amount of force expended in the blow. With the machine in question, however, no calculation is required, the indicator showing at once, exactly how much force has been expended. When it is further explained that the mechanism of this device consists of nothing more complex than a revolving disc carrying a hammer which strikes the blow, and a speed indicating device, which shows its rate of rotation before and after impact, together with a vise for holding the test bar, it appears that it presents no forbidding mechanical or theoretical stumbling block to the understanding.

A general idea of the construction of the Guillery machine may be obtained from the accompanying illustration in which, it will be observed, the wheel, B, mounted in substantial bearings on the bed casting, C, carries a single projecting tooth, or knife, A, firmly imbedded in its periphery. The wheel is set in rotation by means of a spur driving gear on the right side of the machine, which is adapted to be driven either by hand or by means of a V-belt, a clutch lever, F, serving to throw the gears out of mesh when a certain speed of rotation has been attained. The wheel shaft is mounted on ball bearings, and because of the comparatively great amount of its mass which is concentrated at the rim, runs practically without resistance, once set in motion. At the same time, the construction of the pedestal is such that a tremendous impact may be withstood successfully.

The part marked, H, is a movable anvil or chuck, in which the test piece is clamped, and which may be withdrawn from or advanced toward the wheel, according to circumstances, in such a way as to bring the end of the test bar into the path of the knife, A. The mechanism governing the motion of the anvil is interesting, since it provides for the positioning of the test bar under the knife immediately after the latter has passed the striking point, and ensures a full stroke and direct vertical impact.

To this end, a helical spring is arranged in such a way as to force the anvil constantly toward the wheel, that is to say, into a position in which the bar will receive the full impact. An interlocking latch within the anvil is arranged to engage a stop, retaining it and also the test piece out of the path of the knife, and in such a position that the full tension of the main spring is impressed upon it. A trigger rod, extending from the operating lever to a point adjacent to the wheel, and carrying a trigger piece on its inner end, is adapted to move longitudinally under the influence of the lever, and to rotate sufficiently to release the latch, releasing the anvil, when the trigger is struck by the knife. When the lever is pushed forward then, the rod is thrust into such a position that the trigger will come into the path of the knife, which immediately trips it, permitting the anvil to be thrown forward under the influence of its spring, so that the test bar also comes into the path of the knife, but immediately after the latter has passed the point of contact. In this way, the wheel makes a complete revolution after the bar is in place, and before the impact occurs.

The third, and most important element of the device, is the tachometer, D-D, mounted on the left side of the machine, which is provided with a double scale, reading both in revolutions per minute, and kilogrammeters, the latter indication, expressing the amount of energy stored in the wheel, at the speed indicated. This is perfectly possible, since the speed is the only variable factor entering into consideration.

In operation, the test piece is first placed on the anvil and clamped in position, after which the driving gear is engaged and the wheel set in motion and run until its speed, as indicated by the tachometer, exceeds a certain predetermined amount. The driving gear is then disengaged, by means of the clutch lever, and the speed brought down to the required point, by means of a brake, actuated by the same lever. The operator then draws back the controlling lever, which serves to withdraw the anvil to its extreme position and engage the latch. When the lever is pushed forward to its extreme position once more, the trigger rod is thrust forward, the trigger is snapped by the knife as it passes, and immediately afterward, the anvil is thrown forward by its spring so that the bar comes under the knife. The wheel then makes one complete revolution, when the knife impinges against the bar, breaking it off, and continuing to revolve, but at reduced speed.

The effect of the impact is to slow the wheel perceptably, though not to stop it. The tachometer reading falls to an indication corresponding to its reduced velocity, and from the difference of the first and second readings, the amount of force required to break the bar is read off directly. In other words, the initial tachometer reading gives an expression for the amount of energy contained in the moving wheel. A portion of this energy is absorbed by the impact, when the bar is broken. The second reading expresses the amount of energy contained in the wheel and due to its motion after the break has taken place. The difference of the first and second readings, must, therefore, indicate the amount of energy required to break the bar. Since the test pieces are all of standard size, the cross section of which is known, the determination of the force required to cause the rupture, bears a definite and known relation to the ultimate strength of the material under test, in terms of force per unit of section, that is to say, in kilogram meters per square millimeter, or, its equivalent in foot pounds per square inch.

SKIDDING AS A FACTOR OF SAFETY

Curious Theory Advanced by a French Mechanician—Engineering Argument on Which It is Based.

It has remained for Georges Marié, a French mechanician, to discover that skidding affords an actual protection from overturning—that instead of being an absolute evil, it is, at times, a means of safety. His idea is that the side slip furnishes an outlet for a certain amount of energy developed as a result of centrifugal force, which otherwise would serve to capsize the car. In proof of this, he states that motor cars frequently make turns safely—as a result of this automatic compensation, which under similar circumstances would overturn railway cars, because they are confined to the rails and have no such outlet for the side stress due to the turn.

Mr. Marié's ideas are contained in a treatise presented to the Society of Civil Engineers which discusses the question of oscillation in railway trains on entering and leaving a curve. He has endeavored to fix the conditions that must be satisfied by the track and rolling stock, that these oscillations may be dampened and limited to an amplitude within the danger of derailment. For automobiles there is no danger of leaving the track, but great danger of overturning, and with some modifications Marié's conclusions about trains apply also to automobiles. Now the author shows that chauffeurs, even the most prudent, often take curves with radii of curvature much smaller than would suffice to overturn a railway car, other things being equal. If the wheels were guided and held by rails, there would certainly be an accident; what saves the chauffeur and his vehicle is the lateral skidding that re-establishes the equilibrium endangered by centrifugal force.

Again, the lateral sliding has a powerful protective effect even when it is too slight to show on the track. Marie shows that in practice the wheel marks are broadened only 8 millimeters (⅓ inch) for a centrifugal force double that which would overturn a railway car under the same conditions.

When there is no sidewise motion, for whatever cause, at the moment of taking a sharp curve, the car runs real danger. The impossibility of such motion is encountered in two practical cases. First we have the bursting of a tire during a sudden turn—no imaginary case, since such turns impose on the tire a transverse strain that it is ill prepared to support—when the iron rim strikes the road and prevents all lateral motion. Secondly, there is the case of an automobile that turns suddenly on striking a soft, sandy road.

A turn of 10 meters (33 feet) radius is generally to be made only in an emergency, to avoid running over some one, for instance. If the wheels are 1.4 meters (55 inches) apart and the center of gravity 0.9 meter (35 inches) above the ground, calculation shows that an upset would take place in this case with a speed of only 31 kilometres (19 miles) an hour, if the protective skidding did not take place. With 20 metres (76 feet) as a radius, turns are often made at more than 43 kilometres (27 miles) an hour; here again the lateral slip is the safety valve for the rash.

If the road is inclined, there is not so much chance for an upset; this result is paradoxical, but it is capable of explanation; for although a slope increases the tendency to upset, it also increases the tendency to slide sidewise, which more than makes up for it. The side-slip, however, in such conditions, easily becomes excessive, and in many cases the auto escapes overturning only to break a wheel against the curb or to smash against a tree. To sum up, chauffeurs may turn corners at speeds much higher than would cause an upset on a railroad in identical conditions, but it is frightful to think, says Mr. Marié, of the danger of very high speeds, where chauffeurs are threatened with death at every instant.

Never Mind the WEATHER

TRIUMPH GREASE WORKS JUST THE SAME.

IT IS A PERFECT LUBRICANT WITHOUT GUM, PITCH, OR ACIDS.

IT WILL NOT FREEZE IN WINTER

IT WILL NOT MELT AND RUN NO MATTER HOW GREAT THE FRICTION

AT ALL TIMES THE BEST

BECAUSE it is a perfect lubricant.
BECAUSE is is composed entirely of materials that in themselves are pure lubricants.
BECAUSE it does not contain any gum, pitch, acid or any other non-lubricants or any material that in any way produces friction.
BECAUSE it has a heavy body that always leaves a layer of grease between the opposing surfaces of the bearings.
BECAUSE it will not melt, which will prevent the running down on the axle and destroying the rubber tires.
BECAUSE it will stand 410 degrees of heat before it melts, therefore it will not melt and run out of the compression cups or bearings in the hottest weather.
BECAUSE it will not freeze. There has never been a day so cold that it would put this grease out of business.

Owing to the fact that it never wastes and never runs out, and that its molecules are practically indestructible, it lasts in **actual work** from 50 to 100 per ceent longer than other lubricants, and is therefore **immensely cheaper.**

WEIGHTED WITH ACCESSORIES

Why Some Cars Prove Heavier than the Makers Represented—What May Compose the Added Burden.

It not infrequently happens that the purchaser of a new car is considerably surprised on weighing it, to find that its avoirdupois falls considerably over that given by the catalogue. This inconsistency, which probably is not more frequently remarked because comparatively few owners go to the trouble of having their cars weighed, is an extremely common one. While in some degree it is chargeable to the inaccuracy of the maker in numerous instances, in perhaps a greater number the difference in nominal and actual weight is due to the load of accessories with which the machine is saddled the moment it passes into private ownership. Individually, the weight of these articles is inconsiderable, but in the aggregate, they provide a burden on the engine which not infrequently is equivalent to the weight of an additional passenger.

With the idea of ascertaining as closely as possible just what the extra weight of an average car may be after it has been put into commission, a foreign periodical has gone to the trouble of weighing separately a vast number of useful things, such as many motorists love to include in their outfits, grouping them as necessary or desirable, according to their nature. The total makes it appear that the ordinary outfit required for a car of less than 20 horsepower, will amount to upwards of 120 pounds, while for a car of between 20 and 40 horsepower, the weight of necessary accessories is increased to upwards of 150 pounds. The weights quoted, applying as they do, to fittings of British make, naturally work out heavier than would the corresponding articles made in this country. The summation is illustrative of the point in question, however, and as a matter of fact it is doubtful if the average large touring car often gets on the road with less than 200 pounds of traps—needful or otherwise.

The weights of the accessories usually carried on a car of less than 20 horsepower, are given as follows:

	lbs.	ozs.
Double coil Castle horn	3	0
Headlight, single, 7-in. face	4	10
Headlight generator	5	8
Pair side lamps, Castle, Model R.	10	4
Back lamp, Castle, Model R1	2	4½
Tire carrier, for back of car	1	15
Inflator with gauge	3	6
Tangye jack	9	3
Spare Dunlop non-skidding tire, 815x105	24	8
Spare Dunlop inner tube	3	7
Tire repair outfit	3	9
Tire gaiter and lace	1	0
Tire levers, two	1	4
Petrol funnel	0	12
Tool kit	8	0
Quick Grip spanner	0	8
Valve lifter	0	6
Box of split pins and nuts	3	4
Four L. M. sparking plugs, in boxes	1	1
Two-gallon tin petrol	17	10
Half gallon lubricating oil	5	10
Oil can	0	12½
Two lengths insulated wire and insulating tape	1	0
Set of asbestos washers	0	4
	123	2

For a car of more than 20 horsepower and less than 40, the corresponding weights work out thus:

	lbs.	ozs.
Large horn	4	9½
Bleriot headlight, two, Model A, 11-in. lens	26	0
Bleriot generator	9	15½
Bleriot brackets	4	12
Two Castle side lamps, Model SI.	10	8
Dependence rear light	2	3½
Set of Castle tire carriers, side	4	4½
Inflator, with gauge	3	6
Tangye jack	10	2
Spare Continental tire, 875x105, round tread	22	8
Spare Continental tube, in cardboard box	4	11
Tire gaiter and lace	1	0
Tire repair outfit	3	9
Tire lever, double end	1	8
Petrol funnel	0	13½
Tool kit	8	0
Set of box spanners	2	0
Quick grip spanner	0	8
Valve lifter	0	6
Box of split pins, nuts, etc	3	4
Four Pognon plugs, in cases	1	2¾
Two-gallon tin of petrol	17	10
Canvas tire bag	1	3
Half pint oil can	0	12½
Petrol squirt	0	3
Grease injector	0	12½
Two lengths electric wire and insulating tape	1	0
Set of asbestos washers	0	4
One gallon Castle lubricating oil.	10	15
	157	15¼

But in addition to these things, many motorists carry certain articles of greater weight than those already enumerated, and others not included in the list. These are given in the following table, together with the weights of the parts which they are supposed to replace in certain cases:

	lbs.	ozs.
Siren complete	7	6½
Set of three electric side and tail lamps, with 40 a.h. accumulator and switch	16	2
Southall tire tester, in case	0	12
Canvas water bucket	0	14
Stepney spare wheel complete, but without tire	36	3
Tangye jack	10	2
Cleaning outfit, Castle	15	12
Castle electric hand lamp	2	4
Rubber spring buffers, four	2	7
"What is Coming" mirror	2	8
A. R. A. car vulcanizer	3	12
Greenwich dash clock	1	6½
Speen indicator, Jones	11	0
Electric steering pillar lamp	1	4
Tail lamp indicator	0	8
Spare tube case (three tubes)	4	1½
Petrol gauge, Model H	0	14
Chain tightener	1	6
Driver's indicator, with accumulator	8	0
	126	10½

Parts replaced:

	lbs.	ozs.
Horn	4	9½
Set of three paraffin lamps	12	11½
Tangye jack, medium	9	3
Canvas tire bag	1	3
	27	11

Thus the total weight of supplies and accessories for a car of the second class, as obtained by subtracting the weight of parts replaced from the total weight of additional equipment, and adding the remainder to the weights of necessary accessories, works out at 256 pounds 14¾ ounces. From a further tabulation, it is also made to appear that quite a little difference in weight may be caused by the choice of the accessories installed on the car. A surprising amount of difference is thus brought out in the case of the ignition devices alone, as follows:

	lbs.	ozs.
Eisemann Model A magneto, complete	33	11½
Castle four-cylinder coil, 40 a.h. accumulator (in box), contact breaker and switch	28	2½
Simms-Bosch magneto, Type DHh, four-cylinder, fitted with driven gear wheel	36	0
Eisemann Model A magneto, with dual coil and 40 a.h accumulator	40	4½
Castle single special coil, 40 a.h. accumulator (in box), distributor, and switch	20	0
Eisemann Model B magneto	24	4
Eisemann Model C magneto	17	0

A still further differentiation is developed by comparing the weights of several other accessories such as are likely to be carried on the average "well found" car:

	lbs.	ozs.
Wagner electric horn, complete with accumulators	14	7
Castle accumulator, 20 a.h.	4	13
Castle accumulator, 40 a.h., in tin case with strap handle	10	9
Castle accumulator, 60 a.h., in tin case, with strap handle	14	11
Four Pognon sparking plugs in cases	1	2¾
Four L. M. sparking plugs in cases	1	1
Four De Dion sparking plugs in cases	0	15
Four1cylinder Castle coil	16	5½
Castle single coil, for distributor.	5	2
Distributor complete	4	0
Castle single-cylinder coil, ordinary	1	14
Castle single-cylinder coil, enclosed terminals	4	12
Castle single-cylinder coil, De Luxe	5	3
Eisemann dual coil	10	10

While the owner is quite likely to feel the cost of an elaborate assortment of extras, the chances are that he seldom realizes how much difference their weight is likely to make in the actual running of the car, both in mileage, rate and in cost of maintenance. When the matter is considered in the light of carrying or not carrying the equivalent weight of an extra passenger all the time, however, the advantage of reducing the equipment to the lowest possible minimum is at once apparent.

CALCIUM CHLORIDE FOR ROADS

Its Dust Laying Qualities Successfully Tested in Massachusetts—The System Employed in Its Use.

Dealing with the problem of dust on roads experiments have been made along three lines, each considered by its advocates to be the most promising. The use of oil, either in its crude state or as an emulsion, has given results that satisfied those persons interested. The same is true concerning the use of tar in one form and another. A method employed extensively on the roads in that part of Massachusetts known as the North Shore is the sprinkling of the surface with a solution of calcium chloride, which has a strong affinity for water, attracting it from the atmosphere and the earth, and retaining it for a considerable period.

Experiments with this chemical, made abroad, came to the uotice of Colonel Sohier, a North Shore resident, during the summer of 1906. He resolved to repeat the experimenting here, it is stated by the Boston Evening Transcript, and first treated a short stretch of road. The calcium chloride was purchased in crystal form at $15.40 a ton. The crystals were broken up and dissolved in watering carts, one pound of the chemical being mixed with one gallon of water, and from one-half to one-third gallon of the mixture being applied to each square yard of road surface. After two applications it was found that the dust was laid and could be kept down by occasional sprinklings with water.

The success of the first experiment determined Colonel Sohier and his associates this summer to enter much more extensively into the "salting" of the roads and it was decided to treat the Shore Road, a macadam highway from Beverly Cove to the Manchester line and adjoining roads, a total of ten miles, the money for the work being raised by subscription. With this large project in hand a central plant was necessary for preparing the solution. The calcium chloride treatment, which was done by contract, was begun early in the season and was discontinued on November 1, and it has been found that, including the cost of the plant, the cost of applying the chemical for a longer season has been slightly more than the cost of sprinkling with water alone. Not counting the cost of the plant, which is available for years to come, the cost of the calcium chloride treatment was less, the figures being .027 cents per square yard for the season with the chamical and water and .03 cents for sprinkling with water alone for a season of six months.

The calcium chloride laid the dust absolutely for twenty-four hours a day, whereas under the former plan of sprinkling with water four times a day mud and dust alternated. The chemical prevented any ravelling of the top surface of the macadam highway. Six applications of the calcium chloride were made, two in June, one in July, August, September and October, and on dry days throughout the season the road was sprinkled with water once a day. The results of using one watering cart instead of three and watering once a day instead of four times have been much better and dust has been practically eliminated. The surface of the ten miles of road was treated over a strip eighteen feet wide, making 103,000 square yards, and the cost by contract, including the plant, was $331 a mile, Though the sprinkling of the road was stopped November 1, the road is now free from dust.

Colonel Sohier states that the calcium chloride used this summer was bought in solution, instead of in crystals, and was brought to the Beverly Farms station in tank cars holding 6,000 gallons each. It was pumped from the cars into a tank. For applying the chemical a special watering cart was used. Its tank has a capacity of 600 gallons, but on account of the weight of the solution no more than 500 gallons was taken at a time. A hose leading from the bottom of the cart tank was used for drawing off the solution, and a rack in the rear held five large galvanized iron buckets, each of a capacity of 100 gallons.

The watering cart was filled with 500 gallons of 40 per cent saturated solution of calcium chloride at the central plant. Then the cart was driven to the first hydrant along the road to be treated. At this point 100 gallons of solution was drawn off into one of the buckets. At four other points the filled buckets were left. By the means of a special appliance patented by B. P. Richardson, the contractor, the 100 gallons of calcium chloride from the last bucket was syphoned back into the cart, together with the water from the hydrant, reducing the calcium chloride solution to about 8 per cent., which was sprinkled on the road in the same manner as water. At the other hydrants the process was repeated, the buckets being picked up as they were emptied. One carload of the 40 per cent. solution was made to cover five-eighths of a mile.

The Shore Road is a State highway and was built two years ago of the best macadam. It showed signs of ravelling from automobile travel, especially on the corners, and was sanded with a light sprinkling of coarse screened gravel. The whole road was sanded twice and parts of it four times. The calcium chloride through its property of holding and attracting water, kept the top surface of the road in such condition that it did not ravel or wear down to the stones although it is narrow and the travel is extremely heavy. One Sunday last summer, according to a record secured, 1,100 vehicles passed a given point in Beverly Farms in ten hours. About 650 of them were automobiles. In Manchester automobiles have averaged at certain times of day three a minute for an hour.

A valuable property of calcium chloride is its weight. Even if the road surface becomes so dry that dust rises, the fastest moving vehicle does not lift the dust above its hubs and it settles at once into the road. The chemical has no smell and no injurious effects have as yet been discovered; it keeps the dust laid on the surface of the road, and, if properly and economically applied, is undoubtedly better than water and probably cheaper, because with its use two-thirds of the cost of watering carts can be dispensed with, which saving should more than pay for the chemical itself and the extra cost of applying it.

Moral Character Required in Drivers.

Before obtaining a license to drive an automobile in Colorado Springs, a person will have to prove he is of good moral character and is possessed of steady, temperate habits, according to the provisions of an ordinance just passed by city council. The speed limit was fixed at 12 miles an hour within the fire district, 18 miles outside, and 8 miles when rounding corners or passing street cars. Visitors are privileged to drive a car three days without a license and may have that period extended to thirty days, by paying 25 cents to the city clerk. The Board of Examiners to pass upon an applicant for license will consist of the Chief of Police, a representative of the Colorado Springs Automobile Club and a member of the City Council.

Neglected Bridge Causes Law Suit.

J. I. Hetzel, an Altoona (Pa.) dealer, has brought suit against Adams township for damages sustained in an automobile accident which he claims to have been caused by failure of the township authorities to repair the approach to the bridge over the South Fork branch of the Conemaugh River. The plaintiff claims that his head was badly battered, his leg wrenched and three ribs broken. He asks $2,000.

Punctures Caused by Prickly Pears.

Automobilists in certain parts of Montana are having troubles with prickly pears. It is said that great patches of them cover some parts of the roads and that spear-like projections cause slow punctures in inner tubes that make a driver forget his early training. One tourist said his tires were punctured nine times from two or three pears.

Automobilist Sues City for Damages.

Because a trolley company failed to keep a street in Plainfield, N. J., in proper condition while laying tracks, John McCullogh has presented a claim against the city of Plainfield for a broken spring on his car. The accident was due to the torn up condition of the streets, but the city intends to fight the suit, claiming the trolley company is responsible.

The Week's Patents.

864,778. Lubricating Device. Harry C. Gamage, New York, N. Y., assignor, by mesne assignments, to Oil-Bath Lubricator Co., a Corporation of New Jersey. Filed April 5, 1907. Serial No. 366,474.

1. A rotary shaft, an endless lubricant-conveying belt in contact with said shaft and wholly disposed on one side of the axis of rotation thereof, and mechanism for transmitting motion from said shaft to said belt.

864,821. Explosive Turbine. Heinrich Zoelly, Zurich, Switzerland. Filed May 22, 1905. Serial No. 261,583.

1. In a gas or fuel explosion turbine the combination with the explosion chamber and the turbine of an always open expansion nozzle; pumps for compressing the air, steam and fuel; admission valves for these media to the explosion chamber, and means for controlling the same whereby the air and fuel are supplied to said chamber at the time when the pressure therein has dropped to be equal to the pressure of the compressor pumps; an ignition device; and means for controlling the ignition—substantially as and for the purpose specified.

864,824. Variable Speed Gearing. John S. Barnes, Rockford, Ill., assignor to W. F. & John Barnes Company, Rockford, Ill., a Corporation of Illinois. Filed June 6, 1907. Serial No. 377,601.

A variable speed gearing comprising a suitable support, a driving shaft, a sub-shaft and a driven shaft held in proper relation by the support, a spur gear loosely mounted on the driving shaft and provided with a clutch face, a spur gear fixedly connected to the sub-shaft and meshing with the above mentioned gear on the driving shaft, two gears of varying diameters mounted on the driving shaft to revolve in unison, one of said gears provided with a clutch face, a movable double faced clutch section having a driving connection with the driving shaft and adapted to engage the clutch faces of the gears on the driving shaft, two spur gears of varying diameters loosely mounted on the sub-shaft and each provided with a clutch face and in mesh with the two connected wears on the driving shaft, a movable double faced clutch section having a driving connection with the sub-shaft and adapted to engage the clutch faces of the gears on the sub-shaft, two spur gears of varying diameters loosely mounted on the driven shaft and each provided with a clutch face, and in mesh with the two connected gears on the driving shaft, and a movable double faced clutch section having a driving connection with the driven shaft and adapted to engage the clutch faces of the gears on the driven shaft.

864,830. Explosive Engine. Homer Charles, Rapid City, S. D. Filed Feb. 10, 1905. Serial No. 245,096.

1. In an explosive engine, the combination of the working chamber, the pump chamber, a mixing chamber intermediate the pump and working chambers, and through which the air is passed from the pump chamber to the working chamber, means for normally isolating said mixing chamber from the other chambers, and means for venting said chamber to reduce any retained pressure therein before the oil is admitted thereto, substantially as described.

864,831. Thermostatic Regulator for Explosive Engines. Homer Charles, Rapid City, S. D. Original application filed Feb. 10, 1905. Serial No. 245,096. Divided and this application filed March 2, 1906. Serial No. 303,840.

1. In an explosive engine, the combination of a working chamber, a mixing chamber, an igniter head in the working chamber, a valve controlling admission of fuel or water to said mixing chamber, and a thermostat passing through the igniter head and protected thereby from direct contact with the hot gases, and connections between said thermostat and the valve to regulate the temperature in the working chamber, substantially as described.

864,841. Vehicle Rim. Louis B. Gast and Jacob Gast, Jr., Akron, Ohio. Filed March 13, 1906. Serial No. 305,824.

1. A vehicle wheel rim of the class described, comprising a tire seat having a tire retaining means along one side thereof and provided on the other side with a channel below the tire seat with an outer wall extending approximately as far as the plane of said tire seat, said outer wall of said channel being provided with an interrupted series of notches occurring at approximately regular intervals except at the point where a notch is omitted and an endless ring having its outer portion shaped to constitute a tire retaining element with its base approximately flat and of sufficient width to cover said channel, provided on its inner face with an uninterrupted series of inwardly projecting lugs spaced apart from each other a distance equal to that intervening between the notches in the side wall of said channel whereby in seating said ring one of the lugs may be passed over the uncut portion of said outer wall and the balance of the ring swung laterally into position, the balance of the lugs on said ring passing through the notches in said wall and interlocking with those portions of the wall between said notches.

864,844. Hydrocarbon Engine. Edmund Hudson, Templeton, Mass. Filed July 28, 1904. Serial No. 218,565.

1. In combination with a hydrocarbon motor having a combustion chamber and an air compression chamber, an air passage intermediate the air compression chamber and combustion chamber, a piston arranged to control the passage of air intermediate said chambers, a crank shaft, a hydrocarbon pump chamber irrespective of the position of its piston and means intermediate the crank shaft and pump for operating said pump piston, and an opening and closing injection nozzle operatively arranged with reference to the pump and combustion chamber.

864,857. Automatic Oiler. Andrew P. Olson, Chicago, Ill. Filed Jan. 11, 1907. Serial No. 351,796.

1. In an apparatus of the class described, a pump comprising a cylinder with an intake port and an output port, a piston rod adapted to work within the cylinder, a spring-pressed piston mounted loosely upon the piston rod and working to open and close the output port, and a piston mounted rigidly upon the piston rod and working to open and close the intake port.

864,877. Explosive Engine. Ellis J. Woolf, Minneapolis, Minn., assignor to The Woolf Valve Gear Company, Minneapolis, Minn., a Corporation of Minnesota Filed Jan. 6, 1906. Serial No. 294,862.

1. In an explosion engine, the combination with means for introducing and exploding an explosive agent within the explosion chamber, of a water pump operated by the engine and having a delivery connection to the explosion cylinder, a by-pass and a double acting check valve, in the connections from said pump, subject to the pressure from the working cylinder of the engine for closing the by-pass and permitting the water to be forced by the pump into said cylinder, substantially as described.

864,903. Transmission Gear. Arthur J. Morris, Torrington, Conn., assignor to Adelbert P. Hine, Torrington, Conn. Filed Dec. 6, 1905. Serial No. 290,622.

1. A power transmitter comprising a driving member, a driven member, gearing connecting the members and arranged in a train having selective branches, said gearing including planetary gears common to both branches, and means for retarding in varying degree the motion of the planetary gears in their orbit about the other gears of the train to vary the speed of rotation of the driven member.

864,904. Transmission Gearing. Arthur J. Morse, Torrington, Conn., assignor of one-half to Adelbert P. Hine, Torrington, Conn. Filed Feb. 19, 1906. Serial No. 301,860.

1. A power transmitter comprising a driving member, a driven member, a plurality of gears interposed between the members, a selective clutch device controlling direct transmission from one member to the other and the disconnection of the gears from both members and indirect transmission through the gears, and means for varying the relative speed of the gears.

864,905. Transmission Gearing. Arthur J. Morse, Torrington, Conn., assignor of one-half to Adelbert P. Hine, Torrington, Conn. Filed June 13, 1906. Serial No. 321,471.

1. A power transmitter comprising a driving member, a driven member, gearing interposed between the driving member and the driven member including a plurality of sets of speed changing gears arranged on parallel axes, a clutch device controlling direct transmission from one member to the other, the connection of the gears with the driving shaft and indirect transmission through the gears, and means for varying the speed of the gears.

864,906. Transmission Gear. Arthur J. Morse, Torrington, Conn., assignor of one-half to Adelbert P. Hine, Torrington, Conn. Filed Oct. 20, 1906. Serial No. 339,857.

1. In combination, a driving member, a driven member, normally operable gearing including planetary gears connecting the members and arranged in a branched train, means for retarding in varying degree the orbital motion of the planetary gears common to the several branches, and a clutch mechanism selectively operable to connect said driven member with any one of said branches and further operable to directly connect said members and disconnect the gearing therefrom.

864,911. Vehicle Wheel Rim. James M. Padgett, Topeka, Kan. Filed May 3, 1906. Serial No. 315,037.

In combination with a wheel rim having an annular groove, an annular detachable clenching flange to enter said groove and bear against a tire, said detachable clenching flange being cut to form separable, reversely-beveled ends, one to overlap the other, said ends and the said wheel rim being provided with co-acting studs and stud-receiving openings to lock said clenching flange in place, the stud which secures the underlapping end of the detachable clenching flange being movable and having a

Digitized by Google

spring to normally hold it in locking position.

864,914. Spring Equalizer. John Raab and Andrew Raab, Tacoma, Wash. Filed Jan. 16, 1906. Serial No. 296,372.

1. In a device of the character described, the combination with a support, of an elliptical spring carried by said support, a stationary member provided with a hollow post, carried by the lower portion of said elliptical spring, a reciprocating member adapted to reciprocate in said post a slidable member positioned upon said stationary member and surrounding said post, a coiled spring positioned upon said slidable member and surrounding said post and reciprocating member, fastening means for securing said coiled spring upon said post and reciprocating means, and means connecting the upper portion of said elliptical spring and said slidable member.

864,926. Cellular Pneumatic Tire. Edward C. Schoonmaker, Perham, Minn. Filed Nov. 23, 1906. Serial No. 344,723.

1. A tire of the character described comprising a rim section having annular side flanges, a tire provided with similar flanges to engage the flanges of the rim section, non-heat conducting material upon the flanges of the tire and metallic fastening bands shrunk upon the tire flanges for clamping the latter to the rim flanges, said bands being engaged with said non-heat conducting material to prevent the heat generated in the bands from injuring the tire, substantially as set forth.

864,979. Rotary Engine. John A. Mosher, Chicago, Ill., assignor to The Adams & Westlake Company, a Corporation of Illinois. Filed Aug. 27, 1906. Serial No. 332,207.

1. In a rotary engine, in combination, a casing, a rotatable head with the casing and having in its periphery a transverse pocket whose walls are curved to the arc of a circle, and an oscillating wing of sheet metal bent to form a hub conforming to and fitting within the pocket.

864,983. Spare Tire Holder for Automobiles. Leo P. McKinney, Boston, Mass., assignor of one-half to John L. Snow, Boston, Mass. Filed May 14, 1906. Serial No. 316,663.

1. A spare tire holder for automobiles, having, in combination, a base, and a bracket secured thereto by a bayonet joint and provided with means for holding a tire, the bayonet joint including two interlocking engaging surfaces of which one is inclined so as to have a wedging action and to take up lost motion between the parts when the joint is locked, substantially as described.

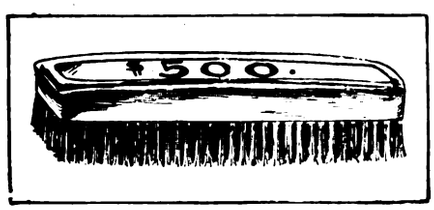
864,985. Buffer. Andrew P. Olson, Chicago, Ill. Filed Dec. 19, 1906. Serial No. 348,552.

1. In an apparatus of the class described, the combination with a pair of coil springs of a buffer bar, a pair of attaching pieces for securing the rear ends of the spring to the frame of the vehicle, and a pair of attaching pieces for securing the buffer bar to the front ends of the springs.

865,002. Vehicle Brake. Bartholomew Viola, Brooklyn, N. Y. Filed Aug. 30, 1906. Serial No. 332,563.

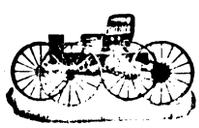
1. In a vehicle brake, the combination with an axle and a pair of wheels carried thereby, of a clutch member secured to each of the wheels on its inner side, a pair of clutch members slidable on the axle into engagement with the said clutch members respectively, means for simultaneously shifting the latter clutch members in opposite direction to engage and disengage the wheel clutch members and adjustable means for insuring the equal engagement of the two slidable clutch members.

865,009. Internal Combustion Engine. Charles Brizzilara, Richmond, Va., assignor of one-half to Dominic Leveri, Richmond, Va. Filed March 27, 1907. Serial No. 364,872.



1. In combination with a water jacketed engine, a storage tank, return and supply pipes connecting the jacket with the tank, means automatically actuated by starting the engine for opening both said pipes, said means comprising a spring-pressed piston and air forcing devices, and means for draining this jacket, these latter means being operated by the stopping of the engine.

865,028. Vehicle Tire. George O. Kankboner, Cleveland, Ohio. Filed Oct. 29, 1906. Serial No. 341,044.



1. In spring cushioned wheel tires, a unitary member comprising a shell of two diameters, a shoe adapted to take the tread of the wheel located in the larger part of said shell and a plunger and spring behind said shoe in the smaller part of the shell, said parts constructed to be removed and replaced together.

865,072. Vehicle Wheel. Ira Abbott, Wyandotte, Mich. Filed Jan. 7, 1907. Serial No. 351,040.

1. In a vehicle wheel, the combination with a rim and a hub, of outwardly extending flanges on the hub forming a groove between, S-shaped springs secured at their outer ends to the rim and having their inner ends overlapped within the groove, and bolts passing through the overlapped ends of the springs to secure the same to the hub.

Remy Magnetos

which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.

We will exhibit at both New York Shows and the Chicago Show.

THE CONTINENTAL AUTO MFG. CO.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

WINTON

We Have the Car

you've been looking for. One that starts from the seat (on compressed air) without cranking. One that gives the widest range of speed on direct drive, in response to throttle. A car that crawls or flies without shift of gear. A quiet, sweet running car. A joltless car. A car fully equipped when you get it. One that gives greatest mileage at minimum wear and tear.

It's the six-cylinder Winton Six-Teen-Six, the exclusive car of the season. Made in the only plant in the world that makes six-cylinder cars exclusively.

"To own such a car is to own a kingdom; the driver's seat is a throne, the steering wheel a sceptre, miles are your minions and distance your slave."*

At the Chicago Show, November 30 to December 7.

The Brush $500 Runabout

Designed by ALANSON P. BRUSH
Designer of the Cadillac (single cylinder)

IT keeps running, costs less than a horse and requires no more care if that care is given regularly, works 24 hours a day without getting tired, eats only when it works, averages 25 to 30 miles on a gallon of gasolene, climbs any hill with a road on it and goes safely anywhere that wheels will go.

Its solid tires cut out all tire annoyances and greatly reduce the tire expense. Even on pneumatic tires its light weight means the nearest possible freedom from tire trouble and expense which decrease rapidly with decrease of weight. On pneumatic tires it rides like a Pullman sleeper and on solids as comfortably as any runabout.

It will not run very fast—up to 27 miles per hour—and seats only two persons comfortably. By observing these limits and *not* trying to make a combination of runabout, touring car and racer all in one, Mr. Brush has produced a car of extraordinary efficiency, reliability and economy.

Cars built by novices may be successful or may not be. Brush is a veteran designer and has had nothing but success. The persistent sale for five years of his Single Cylinder Cadillac, and the marvellous success this season of his Brush Runabout are the best arguments of its merits.

The detailed reasons why, are in our catalogue. Write for it today.

POPE-TOLEDO

One of Our 1908 Models

As to the policy of the Pope-Toledo factory for 1908, we make the following statements:

1st—Our line for 1908 as shown at the New York Show was acknowledged by dealers, users and the press to be the finest exhibited.

2d—This product is now being manufactured and in fact is largely completed ready for assembling.

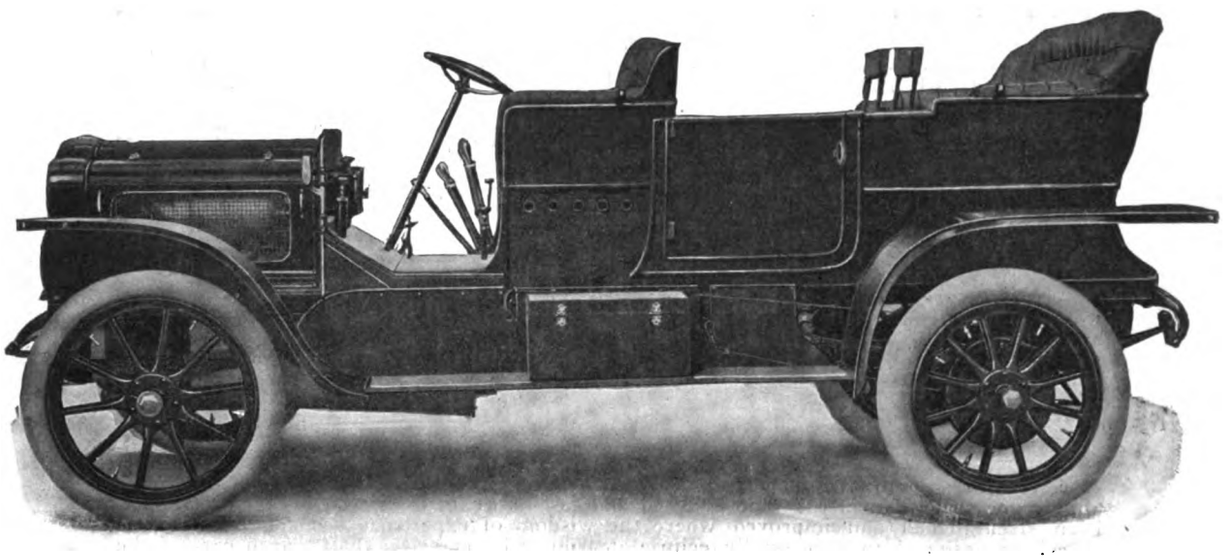
3d—Deliveries are being made with our usual promptness in rotation as booked.

4th—The business is being pushed aggressively and progressively; our old agents are being protected and we want new *live ones only*, where not satisfactorily represented.

5th—Our "square deal" policy towards the user and dealer is being continued.

6th—We will make enough cars to take care of the demand.

7th—An aggressive advertising and publicity campaign is being pushed.



8th—Our new catalogue, the finest we have ever issued, is in the printer's hands.

If you want the finest line of cars made in America today, correspond with us at once

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

WRITE FOR THE NEW WHITE CATALOG

We would like to send a copy of our new catalog to everyone interested in any phase of motoring. Everyone should read, for example, the description of the White generator, thatwonderful steam-makir g device wherein the water is at the top and the steam at the bottom and wherein none of the conditions of the ordinary boiler are present. The references to the continuous success of the White in all forms of competition during the last seven years will also prove of interest. Also, we invite attention to the detailed specifications of our two models—one of 30 horse-power and the other of 20 horse-power—with touring car, runabout, limousine and landaulet bodies.

A POSTAL TO US BRINGS A COPY

THE WHITE COMPANY
CLEVELAND, OHIO

Digitized by Google

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

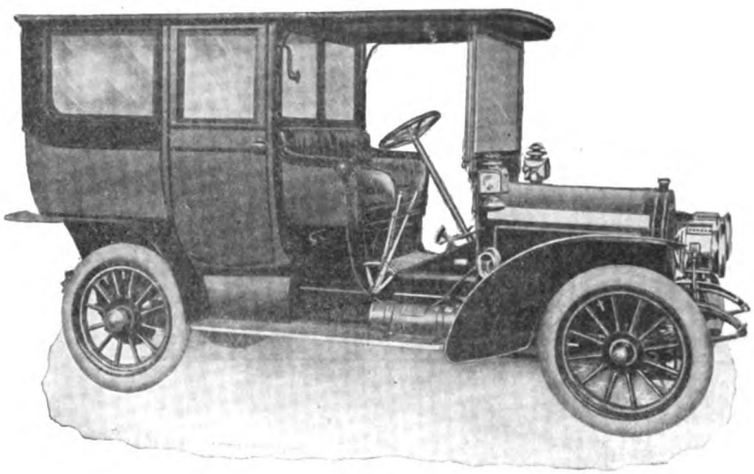
Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Special



This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

E. R. Thomas Motor Co.

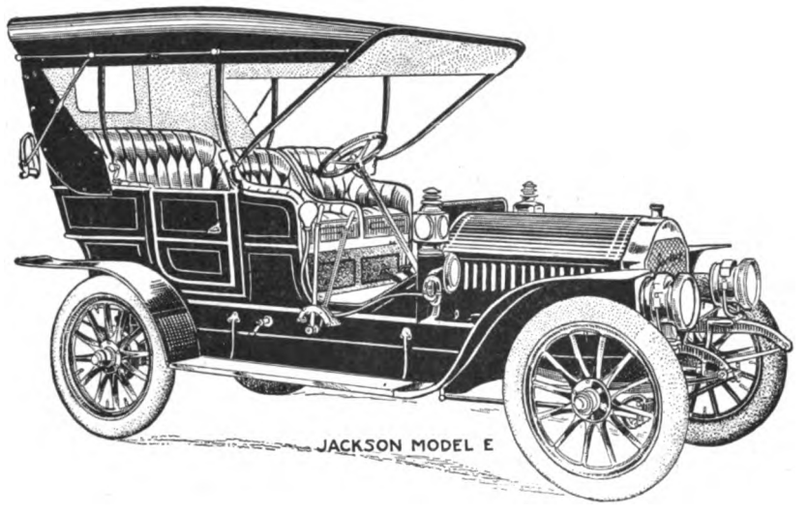
Garford

If a Parliament could be called of all the expert automobile builders in the world to vote on the detailed specifications for an orthodox gasolene car, we believe that the composite of their judgment would be an exact duplicate of the Garford.

Some would quarrel with the majority on one detail, some on another.

But a Garford car would be the net result.



The Garford avoids "original" features. There is probably nothing in the car which is not in the majority of other successful cars all over the world.

"Keep Your Eye On Continentals!"

Continental TIRES

Always In The Lead!

In the Lead in Sales.
In the Lead in Quality.
In the Lead in New Ideas.

In Sales:—There are more Continentals sold than any other tire. Those who buy now have had ample opportunity to make comparisons. Ordering Continentals now, after the testing years have passed, is a matter of deliberate choice. So we may be excused for taking all the more pride in the flattering record for Continentals this year.

In Quality:—The test of use tells whether a tire gives the service or not. Continentals have been aptly characterized as "the-low-cost-per-mile-tires."

In New Ideas:—When has there ever been such a radical advance in the tire industry as the Ready-Flated Tire, with demountable rim, shown exclusively by us this year. This is a spare tire carried "already inflated" adapted for instant use on the road. The entire change can be made in a minute or so, and a child can do it. All you have to do is to slip off one rim, fasten on another, and go ahead.

Send for booklet telling all about it.

Elmore Valveless 2-Cycle

120 Elmore Cars kept in repair by one man

1908

Elmore Thirty, $1750

F. O. B. Factory

The full force of this fact—that 120 Elmore cars in New York are kept in repair by one man—will not come home to you till you have considered what it really means.

Just imagine, one man for instance, trying to take care of half that many cars of the four cycle type—with their hundreds of trouble-giving valves, cams, rollers, springs, lifts and other mechanical complications.

Yet it is being done in New York with the Elmore—because it is the Elmore, because the Elmore is elementally simple, because it has no valves, rollers, lifts, springs, or cams at all, and because it is the most perfect type extant of two-cycle construction.

Elmore Forty, $2500

F. O. B. Factory

If you wish verification of this astonishing and significant fact you can get it through inquiry addressed to A. E. Ranney & Co., New York agents of the Elmore company.

You will find further verification of the fact that Elmore repairs are practically nil and non-existant in every city in the country in which Elmore cars are operated—from every man, in fact, who owns an Elmore car.

From this same man—if he owns a 1908 Elmore car—you will also find verification of the fact that the Elmore ignition system with the installation of the Atwater-Kent spark generator is positively the most wonderful and economical ignition system in existence—a system that will run a car 2,000 miles on one set of six ordinary six-inch dry cells and drain those cells to so low a point that cells discarded by others as useless will operate the Elmore car for miles.

Write for the Elmore literature—but see an Elmore agent.

"Maxwell"

The "Maxwell" is an every day car for every day use.

It is the ideal car for the average citizen, to whom we look to build the motoring industry.

The "Maxwell" is not a freak—it is not a racer. It is a pleasure car of known efficiency, which may be depended upon to surmount the most trying road and weather conditions.

No cars at any price can show a more consistent record of performance than the 14 H. P. Tourabout at $825, and 20 H. P. Touring Car at $1,450—and the new 4-cylinder 24 H. P. Touring Car which is an exact duplicate, mechanically, of the famous Glidden Tour Pilot, maintains the "Maxwell" standard in every respect.

To the genius of Mr. J. D. Maxwell, whose name heads the list of motor car designers, the success of the "Maxwell" line is largely due.

Get a "Maxwell Convincer" at your convenience. Address Dept. 2.

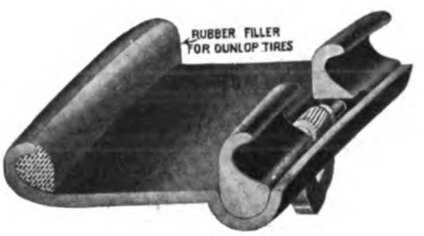
MORGAN & WRIGHT TIRES

have made big gains in the tire field during the past season, due wholly to the fact that they have stood up in a way that commanded the attention of manufacturers, dealers and users.



It is already clear that 1908 will be a banner year for good tires.

There is no method of making friends equal to the method of making good.

CLINCHER

The Improved Midgley Rim, illustrated above, accommodates every make of Clincher or Dunlop tires, as well as every type of mechanically-fastened tires, except one. Standard measurements thruout, including inside diameter. Solid bead.

Manufactured in a factory devoted exclusively to the production of pneumatic tires.

Manufactured by the Pioneer builders of Clincher Automobile Tires in America.

Years of study and experience are necessary to produce a tire that will prove satisfactory under all conditions. Our plant is devoted exclusively to the manufacture of pneumatic tires, and as pioneers in that line we have had the necessary experience, and the results of our close study in one line exclusively are shown in our 1908 tires.

Matheson

Every Matheson car turned out in the last ten years is still running and is reported to be in good condition. Most of the Mathesons turned out within the last three years have never had a single replacement and are still giving perfect service to their original purchasers. Many 1906 Mathesons have to date, been not only free from repairs but from even adjustments. We have many letters from owners of 1907 Mathesons who have given their cars hard and constant use for the last seven months without spending five cents for repairs.

The salient Matheson features are those of the greatest foreign cars. The Matheson differs from these in one important respect—it's better. The great string of Matheson victories during the past season, its new speed records, hill climbing records, endurance records, its perfect scores galore in reliability contests, made not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would direct the improvement of a single feature. Feature for feature through the world's output of high powered cars, not excepting the best of the foreign makes, there is nothing that can compare with the Matheson for performance over American roads.

Write for our new booklet, "I Drove my Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. The Matheson sets a standard by which you may judge other high powered cars.

Volume XVII. New York, U. S. A., Thursday, December 5, 1907. No. 10

DAIMLER IN WAITING ATTITUDE

Unable Under Existing Financial Conditions to Restore the Burned Plant—Facts Brought Out by Suit.

Ever since the fire which, several months ago, destroyed its plant in Long Island City, N. Y., the Daimler Mfg. Co., makers of the American Mercedes, has been at a standstill and that once well known car has ceased to be a factor in the industry.

Late last week point was given to the existing state of affairs by the seizure of six automobiles, said to belong to the Daimler company, at the instance of Mrs. Dora Stadley, who recently was awarded judgment for $8,500 for the loss of her husband, who was killed by a car belonging to the Daimler people. The sale of the seized property was advertised, but at the eleventh hour it was avoided by reason of an amicable understanding reached with Mrs. Stadler.

Inquiry at the remains of the Daimler factory brought out the fact that there is nothing doing there at present. It was stated that immediately after the fire efforts were made to obtain the capital necessary to restore the plant and these efforts were still in progress when the recent financial upheaval occurred and checked them. The Motor World's informant stated that the company is merely "sitting tight" and taking care of its former customers' cars. It is doing no construction work, but so soon as money becomes easier efforts will be made to rebuild.

Ford Asks Receivership for a Bank.

Suit has been filed by the Ford Motor Co. asking judgment for $10,000 and the appointment of a receiver for the Richcreek Bank, of Indianapolis, Ind. According to the allegations of the complaint the Ford Motor Co. turned over to the bank for collection at three different times drafts and bills of lading against the Fisher Automobile Co., of Indianapolis, for shipments to be made to that company. The first shipment, it is alleged, was received Sept. 2, the second Sept. 17, and the third Oct. 14, and in each instance the drafts were paid by the Fisher Automobile Co., the total amount of the three drafts reaching $10,000, which is the judgment asked by the Ford company. It is declared in the complaint that these drafts were receipted to the Fisher Automobile Co. by the bank, and the funds converted to the use of the bank.

Johnson Resigns Continental Offices.

C. S. Johnston has resigned as the treasurer and general manager of the Continental Auto Mfg. Co., of New Haven, Conn., having sold to the company a good part of his holdings. As designer and builder of the Continental cars he was prominently identified with the concern from the start, and in the last two seasons had brought the car into some prominence. A conflict with other interests in the company as to policy resulted in the reorganization which has just been effected, and H. L. Moeller has been chosen treasurer. While not committed to remaining in the automobile business, Johnston has bought two cars from the Continental Co. and will for the present engage in a tour from Boston to Florida, placing agencies where the company is not yet represented.

Berkshire in Hands of Receiver.

At the instance of the company itself and in order to protect the creditors, F. T. Francis has been appointed temporary receiver of the Berkshire Motor Car Co., Pittsfield, Mass. The liabilities are placed at $35,000 and the assets at $30,000. The company shut down two or three months since and announced that it would not resume unless local capital was forthcoming.

Shoemaker Assets Total $31,022.

According to the appraisement of the receiver, the assets of the Shoemaker Automobile Co., Elkhart, Ind., total $31,022.04; the liabilities have not been made public.

NEW MEN CONTROL THE DRAGON

Reorganization of the Company Under New Name—Planning an Ambitious but Conservative Campaign.

New blood and new capital which have been infused into the Dragon Automobile Co., of Philadelphia, have carried with it a reorganization and a change of name. It is now the Dragon Motor Co., capitalized at $1,000,000. In the reorganization John C. Calhoun, a New York capitalist, succeeds John Kane Mills as president, although Mills remains a shareholder in the concern. A. L. Kull, who has had the sales management, will continue to direct it, and under the new order of things also becomes vice-president of the company.

In addition to Calhoun, two other new men now figure in Dragon affairs. These are R. G. Kelsey and C. A. Pickard, who have purchased interests. Kelsey is the well known amateur driver of Brooklyn, who has driven various makes of cars and whose performances in races and other contests have won him considerable fame. He will manage the factory and assumes the title and duties of secretary-treasurer. Having thus been strengthened, the company plans an ambitious but conservative campaign for the future, in which the development of taxicabs will figure prominently.

Pratt to Manage Buick Sales.

J. Elmer Pratt, who recently resigned from the sales department of the Cadillac Motor Car Co., Detroit, did not long remain out of business. He has engaged as director of the selling division of the Buick Motor Co., Jackson, Mich.

Coppock Leaves Marion for Decatur.

The Coppock Motor Car Co. has removed from Marion, Ind., to Decatur, in the same State. The move is expected to considerably advance the manufacture of the Coppock commercial vehicles.

THE WEEK'S INCORPORATIONS.

Camden, N. J.—Empire Engine Co., under New Jersey laws, with $50,000 capital. Corporators—Anthony Tucker, Andrew E. West, and George W. Hite.

Springfield. Ill.—American Automobile Supply Co., under Illinois laws, with $50,000 capital. Corporators—F. M. Roosa, W. R. Reid, E. D. Roosa, Springfield, Ill.

Chicago, Ill.—Taximeter Motor Cab Co., under Illinois laws, with $50,000 capital; to operate motor cabs. Corporators—C. H. Foster, B. Lichtenberger, W. M. Fisher, Chicago, Ill.

Camden, N. J.—Philadelphia Taxicab Co., The, under New Jersey laws, with $200,000 capital; to trade and deal in automobiles. Corporators—Lowder T. Layton, J. T. Hickman, and G. H. B. Martin.

New York City, N. Y.—York Auto Renting Co., under New York laws, with $1,000 capital. Corporators—Richard Adler, 74 West 85th street., Charles Barrett, 18 Morningside avenue, Jack Kendrick, 60 West 43d street, New York City.

New York City, N. Y.—Interboro Motor Dispatch Co., under New York laws, with $500 capital. Corporators—Frederick Ruther, Hicksville, N. Y.; Frederick A. Tuttle, 198 Lexington avenue, Brooklyn, N. Y.; A. R. Kelly, New York City, directors.

Corning, N. Y.—Corning Motor and Engine Co., under New York laws, with $50,000 capital. Corporators—Charles C. Clark, 290 Wtauga avenue; Merrill S. Baker, 267 Baker street, Corning, N. Y.; Laverne J. Johnson, 344 Fairmount avenue, Jamestown, N. Y.

New York City, N. Y.—National Autocab Co., under New York laws, with $25,000 capital, to manufacture self-propelled vehicles, motors, engines, carriages and wagons. Corporators—W. B. Vause, Brooklyn, N. Y.; G. A. Knobloch, New York City, N. Y.; W. Mabry, Brooklyn, N. Y.

Parker Sues and Attaches Property.

At the instance of Lewis D. Parker, its one-time president, property of the Hartford Rubber Works Co., Hartford, Conn., to the amount of $150,000, has been attached in a suit for damage growing out of alleged breach of contract. It is a not unusual procedure in actions of the sort and is not of particular significance. Mr. Parker was ousted from the presidency several years ago despite a contract which he asserts existed and which it is stated only recently expired. It is on this contract that the suit for damage is based.

Muncie Under a Receivership.

The Muncie Auto Parts Co., Muncie, Ind., whose stand remained vacant at the Chicago Show, went into the hands of a receiver on Friday last, 29th ult., following a petition filed by Harvey Hooke, one of the stockholders. The company is claimed to be solvent, its embarrasment being laid to the financial stringency which nowadays is blamed for everything under the sun.

Hawkins to Direct Ford Sales.

After having been associated with the company for four years in the professional capacity of auditor and advisor. N. A. Hawkins has been appointed "commercial manager" of the Ford Motor Co., of Detroit. The new title is said to embrace much more than that of general sales manager in that its incumbent will have complete charge of all the Ford branches and the entire selling organization.

The magnitude of the Ford Co.'s affairs

N. A. HAWKINS

is such as to give Mr. Hawkins great scope for the genius and capacity for organization that he has shown in his professional work as head of one of the largest auditing companies in the West and which bears his name. These qualities he has demonstrated not only in his work for the Ford Co., but for other large manufacturing concerns among his clients. In turning over the detail control of eleven branches and some 700 agency arrangements to Mr. Hawkins, more time and opportunity for the large general questions will be given to Mr. James Couzens, who having built up this organization will now give it only a general supervision, "just touching the high spots," as it is announced. Relieved of the detail burden, Mr. Couzens will bring his work to bear on the extensive campaign for foreign business the world over and the increase of the branch system both at home and abroad.

The appointment of Mr. Hawkins is one which promises to be popular among Ford branch managers and agents everywhere, as he is no stranger to their problems and through his previous work for the company is wholly in the spirit of Ford policies and ambitions. It is said that while heretofore he has not been directly and completely identified with the automobile industry, there are few men better posted in every detail of the business than he.

IN THE RETAIL WORLD.

Seattle will shortly have a branch of the Ford Motor Company located in that city. R. P. Rice, formerly of Chicago, will be in charge.

The Newby Automobile Co., New Castle, Ind., are having a garage erected on West Bond street, with capacity for fifty cars.

From church to garage is the change being made in the old First Christian church building in Omaha. The Bergers Automobile Company will occupy it when alterations are made.

The Allen-Swan Co., of Brooklyn, has been incorporated with $27,000 capital. L. H. Allen is president, and Halstead Swan is secretary and treasurer. The company has secured the exclusive Long Island agency for the Stearns car.

Page & Palmer, 1712 Michigan avenue, Chicago, have taken the agency for the Supplementary Spiral Spring Co., of St. Louis. In addition to handling the Windy City territory they will also cover the states of Michigan and Wisconsin.

Henry C. Lea will build a big garage at 229-239 North Broad street, Philadelphia, representing an investment of $400,000. The building will be three stories in height, 122 x120 feet. It will be in the French Renaisance style, a base of granite, the upper floors of light colored brick and terra cotta.

The new White garage in East Orange, now complete and open for business, contains in addition to the regular features a complete lathe and machine shop, and a paint and carpenter shop. Mr. Olcott, the manager, is an automobile engineer of several years' experience.

At the annual meeting of the Barndt-Johnson Auto Supply Co., Columbus, Ohio, the following officers and directors were elected: President, C. Chris Born; vice-president and general superintendent, W. R. Johnson; secretary and general manager, C. S. Barndt; directors, C. Chris Born, C. S. Barndt, W. R. Johnson, William Bauer and Frank L. Packard.

Smith Coming to Buy and to Sell.

G. H. Smith, of the United Motor Industries, Ltd., of London, will sail for this country on the 18th inst. He has some ignition specialties which he hopes to introduce and also will be open for any American motor novelties of merit. While here he will make Hotel Astor, New York, his headquarters.

Lindoefer Out of the Logan.

F. C. Lindoerfer, for some months with the sales department of the Logan Construction Co., of Chillicothe, O., has severed his connection with that concern. He is no longer associated with it in any way.

The Cincinnati dealers have selected February 24-29 as the dates for their 1908 show; it will be held in Music Hall.

HAIR SPLITTING RELIABILITY RUN

Trivial Conditions that Reduced the Chicago Affair to an Absurdity—How Perfect Scores Were Eliminated.

They called it a "reliability run," but "elimination test" perhaps would be a better name for the contest conducted by the Chicago Motor Club, Tuesday, Wednesday and Thursday of last week, November 26, 27, and 28, and which was designed to stimulate interest in the show which opened on Saturday. As a matter of fact the "reliability" as judged by the standard which governed the affair was of the hair-splitting order. As a result there are nine dissatisfied survivors. Criticism is easy, of course, and the task of the judges, where a tie is at issue, is so difficult that it is not always fair to blame them for having recourse to exacting means, but in this instance the resource was to almost ridiculous trivialities of the most far-fetched kind and extraneous character.

When the run was completed ten cars were found to have lost no points. Then the judges got busy on their process of elimination and brought to bear critical discrimination, the like of which never has obtained in a previous contest. For instance, one of the perfect score cars lost because one of the hair-splitting judges put his hand on the brake drum and discovered it a trifle warm; another car was toppled off the perfect score rung because a bullseye in the lens of a lamp had fallen out; still another had its score soiled because it had been bumped by another car and showed a slightly dented fender as the result, while the Rambler was marked less perfect than others because a speedometer bracket had become loose. But probably the most remarkable evidence of this critical discrimination was apparent in the case of the White. This car was fitted with a canvas under apron, and after finding nothing against the car in any other respect one of the officials discovered that one of the lacings to this apron had been slightly chafed, which was thought to be sufficient evidence against its "reliability" to put a black mark against it.

After all this elimination by the trivialties mentioned it was announced that only Frank Nutt's Haynes had no vulnerable spots or marks against it, and he was declared the winner. The other nine who finished with perfect scores and were reduced by the supercritical judges were: Arthur Kumpf, Pierce Arrow; Ralph Owen, Oldsmobile; Ted Collier, Rambler; R. E. Parker, Auburn; William Leitch, White; W. Mitchell, Locomobile; William Smith, Studebaker; John Aiken, National, and Webb Jay, Kisselkar.

FRANK NUTT, HAYNES, WINNER OF RELIABILITY CONTEST

ARTHUR KUMPF, GREAT ARROW, WINNER OF SECOND PRIZE

Despite the early hour of 5 o'clock quite a large crowd gathered at Michigan avenue 26th, to see the start. Thirty-five cars, all of them sealed, left at one minute intervals. The Royal, with Cook at the wheel, was the first to follow in the wake of the official pilot cars at 5:01 a. m., but C. A. Coey was the first of the contestants to meet with mishap. With R. E. Eads as observer and Charles Gregory as passenger, Coey ran into a ditch, before he got out of the city limits. The accident put a crimp in Coey's expectations as the front axle of the Thomas was so bent that the driver had to return to the starting point.

The first day's run was to South Bend, Ind., and return, a distance of 227 miles, and of the 35 cars that set out bravely in the morning 23 returned at night with clean sheets. Mishaps were frequent, but none of them serious. Marion broke a shaft two miles from the place Coey came to grief, and Cook's Royal Tourist was the recipient of many black marks on account of a broken axle. The other cars penalized were Paul Hoffman, Pierce Arrow, 26 points; D. Buck, Matheson, 16 points; J. Mitchell, Maxwell, 334 points; Frank Grogan, Rapid 'bus, 75 points; J. Heidman, Matheson, 235 points; H. A. Pierce, Pierce Racine, 3 points, and Fred Lesier, Locomobile, 10 points. J. Barnes, Frayer-Miller; Harry Stutz, Marion, and C. A. Coey, Thomas, all withdrew.

Sixteen of the original thirty-five cars survived Wednesday's run to Rockford, Ill., and return, a distance of 190 miles. The Rockford run was uneventful compared with the first day. The Rambler confetti car furished the most excitement by running into a fence 15 miles out of town early in the morning, after which its work was taken up by the pacemaker. The roads were not nearly so good as on the first day.

The technical committee had a busy time after the finish of the day's trip and the work took in the unfinished scores of the first day. Twenty-five points were added to the 26 incurred by Paul Hoffman's Pierce Arrow, the demerits being for doing work equivalent to breaking a seal. The ten points incurred by Fred Leiser's Locomobile were increased to 35 for the same reason. The penalization of M. D. Candecar's Reo, not fixed Tuesday night, was set at 38 points, the fine being for strapping on one corner of the radiator which had become loose. William Smith's Studebaker lost 4 points because he wedged in a piece of wood in the cut-out on the muffler. Don Kilbroune, Silent Knight, lost his perfect score because he tightened the lamp brackets, and the Premier, 18 points, was another car that lost a clean score. There were four withdrawals: Bert Payne, Stoddard-Dayton; E. F. Scheffler, Jackson; J. Heinemann, Matheson, and D. Buck, Matheson.

The final day, Thursday, saw the field of possible perfect scorers reduced to ten. The run was to Ottawa, Ill., and return, a little less than 200 miles. R. Smith, Matheson, was compelled to break the seals on his car, and this act, together with work done, cost him 401 points. F. L. Holmes, Jackson, was caught for 50 points, half of them for breaking a seal. The Autocar was

NEW YORK, DECEMBER 5, 1907

The New York-Paris Undertaking.

Viewing the New York to Paris automobile endurance contest purely in the light of a piece of journalistic enterprise, it is admirable. For arousing discussion and attracting the attention of the public not only to its promoters but to the automobile in a general way, it is a most brilliant conception. But considered as a test of individual merit on the part of competing cars or of the abilities and utility of automobiles as a whole, it is impossible.

Admittedly a much more difficult undertaking than the Pekin-Paris affair, it is bound to take on some of the features which made that exploit of little value when regarded critically as a demonstration of the automobile's ability to travel anywhere that may be represented as land on the maps. Of the 6,200 miles from Pekin to Paris many a mile was covered with the aid of oxen or horses, and on some parts of the journey a coolie carrier for every 100 pounds of weight was provided, and the latter's sweating labors bore testimony to the wisdom of such a provision. In the proposed New York to Paris journey of 15,000 miles the obstacles are immeasurably greater, and it would be impossible for the machines to go the whole distance without outside assistance, even excepting the matter of boat transportation across the Bering Strait.

Such a race or contest would be a contest indeed, but least of all for the cars themselves. It would be a battle of money, executive ability, human endurance, ingenuity, and resourcefulness, with a dash of luck to mix matters. The secret of winning would be in having the best drivers, the wisest guides as to the detail of the route, the most perfect arrangement of supply stations, and the most adequate provision for assistance in time of trouble. Thus the car accompanied through the hard portions of the trip by the biggest or most efficient army of sappers and miners, road builders, teamsters, dog drivers, topographers, mechanics, commissaries, blacksmiths, and supply and repair parts carriers, might be expected to have the best chance. The merits of the competing machines would be insignificant, granting that they averaged anywhere near the standard of performance demanded of even the most ordinary car in the more usual forms of service.

As a purely publicity stunt, the scheme has much to commend it to the trade and features that will commend it mightily to ambitious persons with an eye to the value of free advertising. Any one who is looking for that sort of thing should devise something unusual "for use in the Arctic regions" and get in early to avoid the rush.

It is quite possible, therefore, that the undertaking will be launched with an imposing entry list and a grand hurrah, and that ultimately some of the contestants may even reach Paris by the specified route, but it is not possible that it can be a significant test of the competing machines or a convincing evidence of the motor car's capacity for conquering all difficulties by land. To make the distance by the route suggested, the cars will have to be helped, a fact which will completely nullify the ostensible objects for which the whole affair is designed. If a man undertook to make the New York-Paris journey or any other journey afoot or ahorse and enroute was assisted by other means he would be disgraced. The automobilist who engages to do anything of the sort and employs other than the power of his own motor should be placed in the same category.

Whatever the value of the contest it is a theoretical publicity value and not a practical one, except as it may familiarize a number of people with a neglected geography.

The Extreme of Absurdities.

In the strenuous effort to prove themselves worth of their hire, press agents identified with the automobile industry have been responsible for certain evils that undesirably exist. One of the most reprehensible of the tricks practiced by some of them has been the oversmart effort to deceive editors and the public with items which make it appear that cars which they, the press agents, are paid to boost, won certain contests in which they competed when, as a matter of fact, they were merely near-winners or "also rans." These press agents have an adroit way of relating how a car "defeated 25 others of greater power," or something to the same effect, and failing utterly to say that it, in turn, was beaten by 2 or 22 others. It is sharp practice of the detestable sort and one which no reputable and self-respecting manufacturer should countenance.

But if there are many more reliability runs of the kind conducted last week in Chicago such press agent practices must become perfectly legitimate. We have full sympathy for the difficult and usually thankless tasks performed by the officials of such contests, but when they measure the reliability of a car in whatever degree by the lukewarmness of a brake, the looseness of a speedometer bracket, the loss of a lens in a tail lamp or the chafing of a lacing, they cease to be subjects for either sympathy or admiration. To proclaim broadcast that a car is less reliable or entitled to less credit because of such extraneous and ridiculous trivialities is the extreme of absurdities and is calculated to make the world indulge in a horse laugh. When hair splitting of that order prevails, the human senses are not capable of doing equal and exact justice to all. Any man, manufacturer or otherwise, who knowingly would submit his product or reputation, or any part of it to such microscopic judgment would be an ass of high degree. Those who suffered because of it cannot be blamed if their press agents become extremely busy in the effort to expose the absurdity of the Chicago undertaking and in claiming their just due.

EXPORTS CONTINUE TO INCREASE

October Figures Show a Big Gain—United Kingdom and France the Largest Customers—Mexico Falls Off.

In October 201 American automobiles were exported to other countries, their value being $276,198, which with parts to the value of $41,870, made a total of $318,068. During the month of October a year ago the total of exports was $247,094, so that the gain for October alone is $70,974. This is in happy accordance with the steady advance that has been shown by the preceeding months, which is evidenced by the figures for the ten months ending October. In that period there have been shipped 2,622 complete machines, valued at $4,718,676, which, with parts exported, make a total of $5,281,953 as against $3,891,273 for the same period last year, or a net increase for ten months of $1,390,680.

The United Kingdom continues to be the largest customer for American motor cars, its October purchases amounting to $118,470 as against $43,633 last year and its tital for the ten months reaching the respectable figure of $1,622,261 as compared with $1,065,541 for the corresponding period in 1906. France, like the United Kingdom, shows increased purchases for both the month and the ten months, the French appreciation of American automobiles reaching $29,199 for October and exceeding a half million dollars for the past ten months. British Australia and the Asiatic countries more than doubled their takings during the month and swelled their total increases to considerable proportions. Mexico, while the second largest purchaser of the month, shows a decided falling off, the figures for October being $44,772 as against $67,389 in October a year ago. The total of Mexican shipments for the ten months likewise shows a decrease. British North America also drops for October but the ten months' total gives a substantial gain. This is similarly the case with Germany, Italy, Other Europe and the British East Indies.

The record in detail is as follows:

	October		Ten months ending October		
	1906	1907	1905	1906	1907
Exported to—					
United kingdom	$43,633	$118,470	$604,782	$1,065,541	$1,622,261
France	15,475	29,199	254,030	286,794	561,582
Germany	12,423	5,776	101,998	124,190	164,050
Italy	184	154	154,325	239,928	242,345
Other Europe	17,782	6,613	223,817	196,471	267,674
British North America	48,600	38,438	501,765	815,031	1,124,979
Mexico	67,389	44,772	150,042	613,453	557,454
West Indies and Bermuda	4,665	13,693	124,552	207,834	236,004
South America	18,923	23,865	47,938	122,382	208,919

British Australasia	5,563	16,386	85,548	106,476	170,882
Other Asia and Oceania	6,611	17,651	60,591	63,800	77,514
Africa	4,847	450	28,737	15,519	7,939
Other countries	344	2,362	2,894	6,932	11,400
Total automobiles and parts of	$247,094	$318,068	$2,369,621	$3,891,273	$5.281,953

Taxicabs Swell Total of Imports.

Statistics for the month of November are of the sort that will give renewed hope to such of the importers as desire to "fool their fancies." The month's totals show a large increase, but the increase is due not to sales of pleasure cars, but to taxicabs. During the month 145 automobiles of the total appraised value of $428,435.64, were brought over, in comparison with 98 cars, valued at $372,752.50 in November, 1906, and 75 cars valued at $291,913.31 in the same month of 1905. Thirteen hundred and thirty-eight cars, valued at $4,492,685, have been entered at the port of New York during the eleven months ending with November, compared with 1,420, valued at $4,978,067.71, and 986, valued at $3,759,317.91 for the same period of 1906 and 1905.

Autolyte Increases Its Scope.

The Tutolyte Mfg. Co., New York, of which the well known A. H. Funke is manager, has taken over the automobile supply department of Sibley & Pitman, who do business at 26 Warren street, to which address the Autolyte company has removed. Mr. Pitman, of the firm, has become treasurer of the latter concern.

Estep to Become Advertising Manager.

E. Ralph Estep, who from an eerie in Chicago, has been handling the Packard publicity during the past year, will come down to earth in Detroit on January 1st. On that date he will be established in the Packard factory as advertising manager and will devote himself wholly to that task.

Two Meetings, but Little Done.

The executive committee of the National Association of Automobile Manufacturers, and the board of management of the American Motor Car Manufacturers Association both held meetings in Chicago yesterday. Only routine affairs were, however, dealt with.

Compressed Air Engine in Operation.

George T. Garside, Reading, Pa., who is described as a nephew of Charles E. Duryea, has invented a compressed air engine. Attached to a buggy, it is said to be doing actual duty on the streets of Reading.

PIONEERSHIP IN THE INDUSTRY

Claimants for the Honor Set Forth Their Claims—An Interesting Chapter of Automobile History.

Infant industry that the manufacture of automobiles in the United States is, there is nevertheless a growing rivalry for veteranship honors among the manufacturers and designers, and those who have been engaged in it for some years are not averse to letting their early participation be known. At the Chicago show there was considerable discussion as to the pioneer distinction and in the thick of the battle there was issued a statement which proved an interesting contribution to the history of the automobile movement and of men who were among the first in the field.

Epitomized, the statement says that in 1893 Elwood Haynes, then manager of a gas plant in Kokomo, having seen a Sturgis electric at the Chicago World's Fair, put up money for Elmer and Edgar Apperson to build a gasolene motor car, the first one being completed at the Riverside Machine Works in Kokomo early in 1894. John D. Maxwell, now of Maxwell-Briscoe fame, was one of the working force, along with the Apperson brothers and three other mechanics. The first machine accomodated two passengers and had a single cylinder, two-cycle, vertical motor, developing one horsepower. In 1895, the statement continues, the Apperson brothers brought out the first two cylinder opposed motor ever built, and, on the same authority, Charles E. Duryea publicly brought out his first motor car in 1895 and Alexander Winton in 1896.

In 1895 Haynes and Elwood Apperson formed a co-partnership, each paying half the expense for building experimental horseless carriages, the work being done by the Apperson brothers. The Chicago Times-Herald Thanksgiving Day race that year had as competitors a Haynes-Apperson, a Duryea, an imported Benz, and a car made by E. J. Pennington. The Haynes-Apperson Automobile Co. was formed by Haynes and Elmer Apperson in 1898, each taking a quarter of the stock while outsiders took the remaining half. This resulted in the building of the first exclusive automobile plant in America.

The arrangement continued until 1901 when the Apperson brothers withdrew, returning to the Riverside Machine Works, where the first car was built, to manufacture "Apperson" cars for themselves. The Haynes-Apperson Co. was re-named the Haynes Automobile Co., and its product the "Haynes." In 1903 the Apperson brothers "plunged" on four cylinder cars exclusively, a policy from which they had no reason to deviate except this year, when a six cylinder was added to the line.

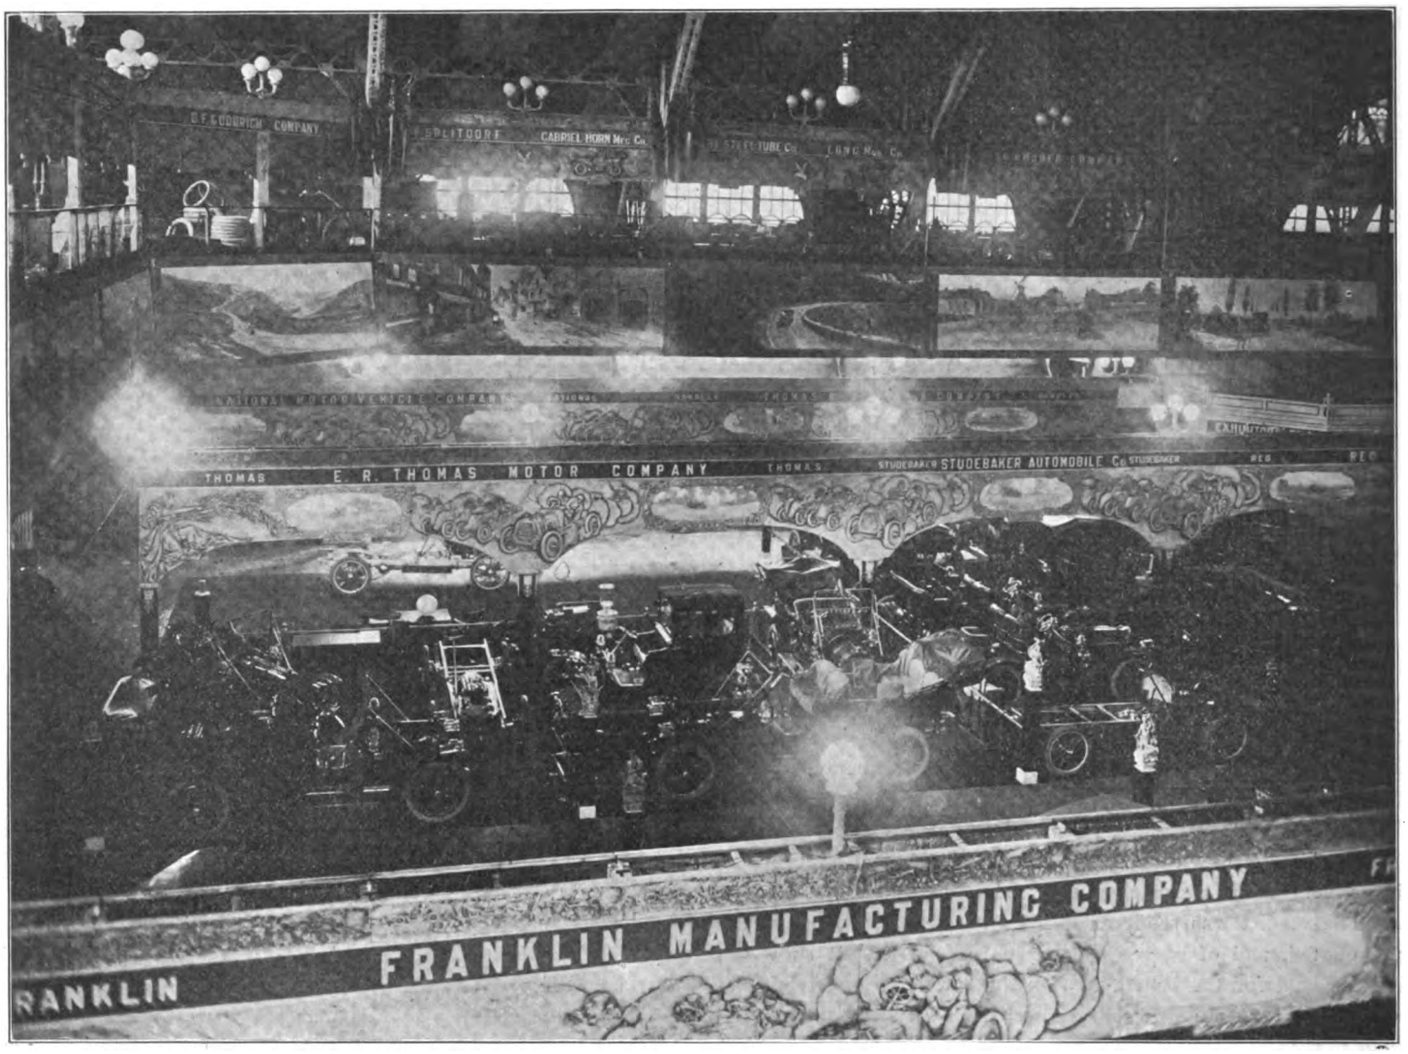
Chicago, Beautiful and Biggest of the Big Shows

Chicago, December 3, 1907.

"As far as decorations are concerned, this show has the New York show completely buffaloed."

This was the proud and breezy verdict delivered to a man of and from the East before he had been within the confines of Chicago very much more than sixty minutes. The verdict was rendered in the language quoted, and of course by a man of the West; and for the benefit of those not versed in the vernacular, it may be well to explain that to be "buffaloed" is to be "outclassed," "licked to a finish," "beaten to a pulp," etc.



There will be no dispute that the Chicago Show, which, preceded by usual snowstorm, was opened at 2 o'clock, Saturday afternoon, is a very handsome and impressive exhibition. It is by far the largest ever held in this country and whether or not it is the most beautiful one is of small moment. It is a credit to the industry and to the promoters—nominally, the National Association of Automobile Manufacturers; specifically, Samuel A. Miles.

Without intending disparagement, a visitor likened the show to a three-ring circus, and for the purpose of conveying an idea the simile is not inapt. The exhibits are housed in three separate buildings, the Coliseum, the First Regiment armory, and the Seventh Regiment armory, more often styled Tattersalls, since it serves as a horse market. The First Regiment armory adjoins the rear of the Coliseum, from which it is separated by an alley, but the main entrance being "around the corner" it is necessary to walk the better part of a block to go from one building to the other. Tattersalls is three blocks distant, and on an unfrequented, uninviting street. It was there that the commercial vehicles and three of the pleasure cars were staged, but despite the fact that one admission fee permitted entrance to the three rings, but an insignificant proportion of those who have attended the show have made the journey to the commercial display. When there are fifty visitors in the place at one time, it is reckoned as a crush. It was not expected that the wagons and big trucks would hold interest for the populace, and the consequent abundance of elbow room has caused dismay to none save, possibly, the makers of the three pleasure cars who could not find space in the main ring. The display is distinctly creditable, and as the first of its sort, it appears to mark the real beginning of the long promised new era. It is an attraction for hard headed, earnest manufacturers and other business men.

A fire which threatened to wipe out the exhibit of commercial vehicles in Tattersalls, broke out a few minutes after 11 o'clock this (Tuesday) morning, looked dangerous for a while. It was caused by an overheated stove pipe in the gallery which set fire to the woodwork and in turn to the bunting that concealed the roof. Great bunches of the burning cloth fell on exhibits and exhibitors and carpeting and when they were not brushing the burning bunting off their cars or persons, or stamping out the fire in the carpet, the exhibitors were making strenuous efforts to push their heavy vehicles to the main entrance only to discover that it was too narrow to permit of their being removed; they had been entered through the big side door and it was that portion of the building that was threatened by the flames. When the fire department arrived, however, it made short work of the conflagration, but not until it had burned a big hole in the roof and denuded it of bunting. But one vehicle, a Worth, was damaged, and it was chiefly its canopy that suffered. A Motor World man who chanced to be in the building during the progress of the fire, found later that but one exhibitor had insurance that covered the case. Repairs were quickly effected and the show was "doing business" again in the evening. Few of the exhibitors in the other two show buildings knew anything of the conflagration in Tattersalls until long after it was over; nor are many of those in the Coliseum itself yet aware that about an hour later a little blaze in that building was nipped in the bud. Crossed electric wiring under the White booth was the cause of it, but after a part of the flooring had been chopped through the fire was quietly snuffed out.

In the Coliseum proper, the glass roof and most of the big iron girders are hidden by alternate loopings of green and yellow buntings, relieved by pendant flags of all nations. It is not a color scheme that brings joy to the camera men or that assisted in the making of strikingly clear photographs. When he realized the fact, Ralph

A VIEW FROM THE COLISEUM GALLERY

Estep, the Packard publicity man, "got busy." He was stricken with a fearful lapse of memory. The Packard lavender and gold "honeymoon car" was in evidence, as was the "bride," and the presence of both suggested a picture. Estep, after posing the lady in the car near the "piece de resistance" of greenery and undressed statuary which hid the entrance to the cafe, summoned a small army of flash-light artists. He totally forgot all about the ban on their operations, and when they touched off their powder, there was a puff of smoke and a roar, that caused nerves to jump.

Estep got his picture and something more. The law was laid down in a fashion that effectually forbade further photography of the sort and Estep, his memory restored, apologized profoundly for his lapse. And at that, the laugh is on the publicity man. He overlooked the sign "Cafe," which pointed the way for those who hungered or thirsted, and as a result the photograph shows the "bride," as if emerging from the drink dispensary and with the "bridegroom" suggestively missing—a most unhoneymoonish proceeding.

Previous to the show much was made of the paintings by Maratta and the larger brushworkings by artists of unknown name and fame, both of which form features of the decorative plan of the main hall of the Coliseum, but as a matter of fact they are "buffaloed" by the great arches of papier mache finished to simulate marble, and by the statuettes of a goddess kneeling in a motor car, which latter surmount the red pedestals placed at the corners of each exhibit. A Maratta painting framed in light green forms the center of each arch; on one side of the picture is Fame, kneeling and naked to the waist, holding outstretched the palm of victory; on the other side of the picture is depicted in bas relief a striking scene of four cars racing abreast and with great clouds of dust reared behind them. It is a stirring piece of work and so well executed as to command admiration. The kneeling goddess is of the same character and is quite fit to adorn more than a public motor show. There is an archway for each exhibit—on the main floor. The exhibitors' names are spelled out in white and gold letters on a background of deep red. The carpeting is red and green. If he does not lift his eyes too high, the visitor may be tempted to agree with the Western enthusiast concerning the "buffaloing" of the New York show. Above the archways and forming the four sides of the "well" made by the gallery are the scenic artists' series of pictures of motoring scenes enclosed in cheap green framing. They are true to life so far as the motoring part of the pictures are concerned, but the man with the brush drew on every color in the rainbow, which fact, coupled with the green and yellow bunting up aloft and the more refined tones on the main floor, has caused a perfect riot of color that mars the general beauty and effectiveness. If instead of these pictures and the common and exposed chicken coop wire netting, which constitutes the guard for the gallery, there were but some filmy and subdued bunting, the whole picture of the show would be impressively and harmonizingly beautiful. Of course, this is a possibly hypercritical view, but the fact remains.

In the gallery, where it is necessary to dodge the supporting beams, there are

Digitized by Google

papier mache arches also, but of smaller size, and instead of Fame and the modern chariot race, the figures in relief are those of tourists and the center piece is not a Maratta painting, but a plaque of Mercury with wings in his head such as did duty last year. Over each exhibit is a cluster of electric lights, each bulb set in a papier mache reproduction of an automobile lamp In the Coliseum annex, there are no decorations whatsoever. In the basement light green bunting hides the walls and the signs are raised white and gold letters on a dark green background.

In the First Regiment armory the decorations practically are the same as those in the Coliseum, save that red and yellow, and not green and yellow, bunting hides the roof and that there is no "art gallery." In the Seventh Regiment armory, or Tattersalls—whichever sounds most pleasing—the roof is or rather was red and blue—the fire this morning entirely destroyed the bunting—and there were kneeling goddesses on pedestals and white and gold letters on red backgrounds—that's all.

"Show weather" in Chicago rarely has been pleasant weather. Usually when snow was not actually falling, there was much of it under foot; when the skies were not dark and lowering, blustering, biting winds prevailed. These conditions have prevailed on the present occasion, but possibly because Chicagoans are accustomed to them, they have not served greatly to affect the attendance which has averaged good. There was the usual big mixed crowd present on the opening night and since then the gate has been not so large but of better class. It has not been so large, however, as to make sight-seeing difficult. Up to this writing there has been no great influx of dealers and no great volume of business has been transacted, nor have many of the big men of the big companies yet put in an appearance. The week is young, however, and the next four days probably will alter the situation.

The Ford, the Aerocar, and one or two others of the better known western cars that were staged at one or the other of the New York shows, are conspicuous by their absence here, but their places are taken by the Rambler and American Berliet, which in New York were exhibited at "exclusive shows" of their own. There also is in evidence the usual not inconsiderable number of western manufacturers of lesser renown or recent origin, most of whom are little known in the East. All are shown on a common footing. There is no line drawn between Selden licensees and "independents." As a result, the Pierce Great Arrow, the product of the president of the Association of Licensed Automobile Manufacturers, is a near neighbor of the Maxwell, in the manufacture of which the head of the American Motor Car Manufacturers Association is one of the vital factors. Similar evidence of equality is observable throughout the whole show. The display of "trophies of the chase" is one of the interesting features of the exhibition and in at least one instance, that of the Pierce Great Arrow, the display of big, bright silver cups attesting the prowess of the car and its drivers, is so large as to be worthy of a high class silversmithing establishment.

As a matter of course, none of the 1908 cars that had previously made their appearance in New York have been added to or subtracted from in the interim, and mention of more than their names would prove in the nature of tautology. They all are here—Pierces, Mitchells, Packards, Locomobiles, Maxwells, Columbias, Whites, Wintons, Cadillacs, Appersons, Thomases, Oldsmobiles, Nationals, Marmons, Elmores, Premiers, Reos, Pope-Toledos, Pope-Hartfords, Pope-Waverleys, Franklins, Stoddard-Daytons, Mathesons, Hayneses, Stevens-Duryeas, Corbins, Bakers, Studebakers, Jacksons, Rainiers, Stearnses, Royals, Dragons. Autocars, Lamberts, Knoxes, Northerns, Frayer-Millers.

Such of the cars as have not appeared this year at either of the New York shows, prove, in the main, a worthy addition to the list of show vehicles, and with one or two exceptions, are well worth studying because of their inherent characteristics. As exceptions to the rule, are found one or two radical departures from common practice, such eccentric features, in nearly every case being confined to one or two parts of the car, the machine otherwise, being perfectly regular in its construction. These displays of outre design are, however, comparatively rare, and equally to the point, even if somewhat startling.

Ample refutation of the old saw about the prophet's popularity on his native soil and its vicinity, is furnished at the Rambler exhibit, where the neat and workmanlike design of the 1908 models is well displayed in the polished chassis, which not long since graced the "private" show held in New York, though not appearing at either of the large exhibitions. In particular, the rear axle and transmission construction catches the eye, the compact arrangement of the gear box, together with the evident effectiveness of its operating mechanism, being sufficient to hold the attention of all who are truly interested in automobiles.

In the same situation as far as first appearance at one of the large shows, is concerned, the American Berliet exhibit, also is of interest. The clean-cut mechanism of the six-cylinder chassis on view, as well as the smooth and beautifully finished body surfaces, serve to draw attention to the studied simplicity of every line and curve, both of mechanism and superstructure.

Tincher and Its Unusual Features.

Among the more massive cars displaying thoroughly original design in every respect, is the Tincher, which gains somewhat in interest, from having skipped last year in its attendance upon the Chicago show. It is made in four and six cylinder motor equipments, depending upon the style of chassis employed, and in both runabout and full touring car form. The very latest development is the 90 horsepower six-cylinder machine, the chassis of which occu-

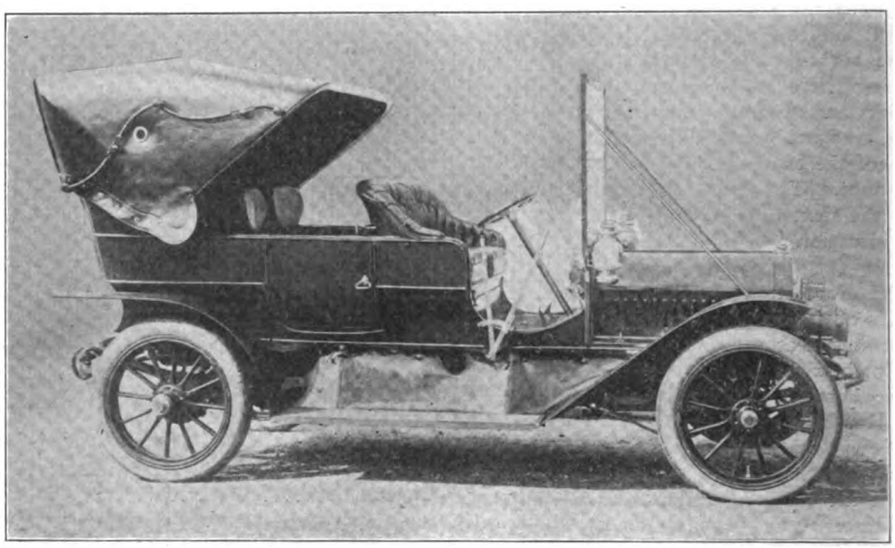
pies a prominent position on the stand, and which embodies the regular Tincher characteristics, such as the independent construction of the cylinders, which are cast individually, the separate compartment type of crank case, which has but a small intercommunicating area between the crank pits, overhead valve gear of original design; and selective sliding gear set, in which the selection is made by moving the hand lever vertically instead of in and out from the car, as is more usually the case. The manner in which this is effected is interesting mechanically, as the mechanism is particularly strong, and also provides an automatic lock for the sliding sets when not in use.



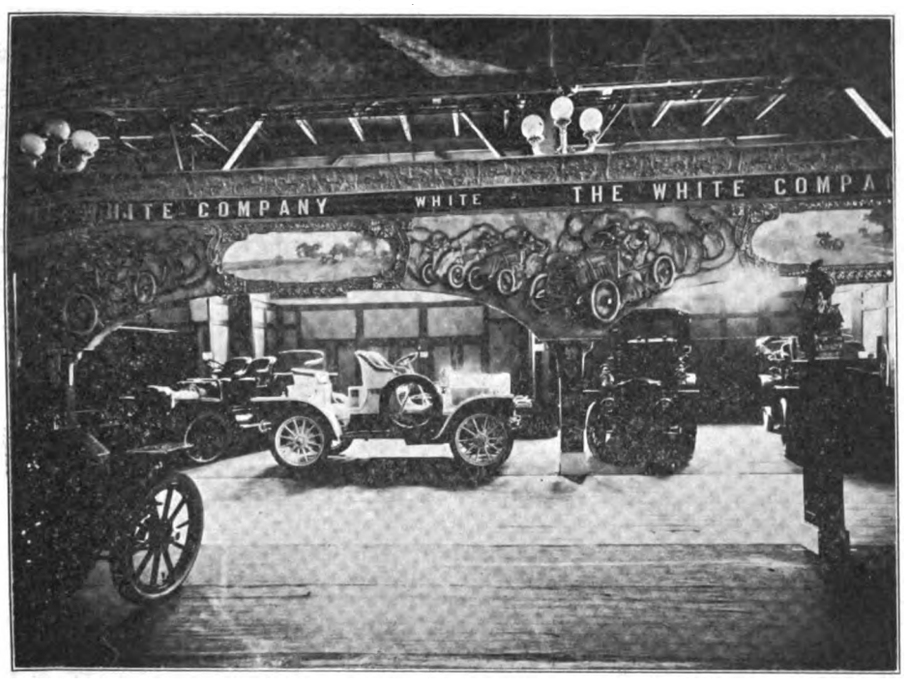
RAMBLER RUNABOUT

One of the most unusual features of the motor is the use of a double gas intake to the cylinders. To this end, the throttle chamber of the carburetter is tapped with a number of small pipes, one leading to each cylinder, to which they are connected by a small combustion pocket in which the spark plug is inserted and which is mounted entirely outside the cylinder proper. The arrangement is such that when the throttle is closed, these leads still remain open, so that for slow-speed, idle running, the gas is inducted directly over the plugs, and through independent paths to each of the cylinders. Ordinarily, the major portion of the gas passes through the regular channels to the intake valves in the usual way. At the same time, a very small amount of gas is drawn through the small leads by the check valves which close their delivery to the cylinder, and into the small combustion chambers. Ignited there, it creates a sharp flame, which is shot out into the combustion chamber proper in the center of the cylinder and at once effects a rapid and thorough ignition of the main body of gas. The cooling effect of the play of live gas on the ignitors, also is reckoned to be of no small value.

The chief specifications of Model H, which is the most recent quadruple type, are: Motor, 50-60 horsepower, 5 by 6 inches bore and stroke; clutch, contracting band, on a bronze drum; change gear, affording four forward speeds; double rear wheel brakes; semi-elliptic springs; wheel base, 127 inches; tires, 36 by 4, and 36 by 5 inches, front and rear.

Lorraine that Lights Its Way.

An automatic starting gear, a flexible propeller shaft, and an ignition system which also furnishes continuous current for lighting the lamps, constitute the principle features of the Lorraine car—a new product, shown for the first time. Otherwise, it is a well proportioned, touring vehicle of the familiar class which is above criticism as far as outward appearance is concerned. Its principle characteristics are: Four-cylinder motor, of 5 inches bore and stroke; leather faced cone clutch, with spring actuated plungers beneath the leather; three-speed change gear, optional as to method of actuation; shaft drive; full floating axle. The wheel base is 124 inches; the wheels are 36 inches in diameter, shod with 4½-inch tires. The mechanism is mounted, practically throughout, in annular ball bearings.



THE LORRAINE. A NEW COMER

The automatic starting gear, which is of the Hobbs-Renault type, consists of a simple air-compressor and tank, the active portion of the system comprising a small cylinder placed transversely of the car just back of the master clutch, and containing a piston and rod, the latter carrying a rack on its under side which is held constantly in mesh with a spur gear mounted loosely over the driving shaft of the car, but connected with it by means of a ratchet contrivance. The piston is held at the head of the cylinder, normally, by means of an internal helical spring. When air is admitted to the cylinder, the piston is driven out, throwing the crank shaft sufficiently to turn the motor over one compression. As soon as the controlling valve is released, the air is permitted to escape, and the spring returns the gear to its normal position.

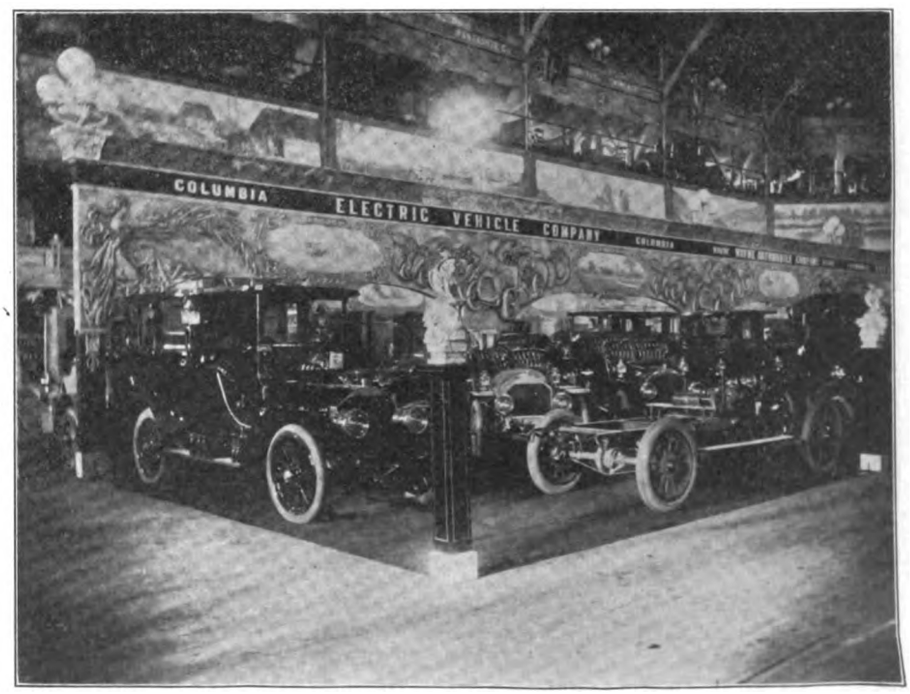
The flexibility of the driving shaft, which is a most important and radical feature, is obtained through the medium of a bundle of small steel rods lying parallel to the shaft and clamped to it at either end, the shaft ends being loosely connected by means of a jaw clutch which permits freedom of motion to the ends through 22½ degrees of travel. The rods being firmly clamped in place, absorb any and all torsional strains thrown upon the shaft, the jaw clutch coming into play only under extreme conditions. By this means any minor speed variation due to the unevenness of the road or the angularity of the cardan joints are absorbed, and the gear teeth protected correspondingly, from shock. The shaft used in the car on view at the Coliseum has 24 of these driving rods, of 5-16 inch diameter, and sufficient length to permit the motion allowed by the clutch, without unnecessary distorsion. So far as is known, this is the only arrangement of its kind at present used in this country.

The ignition system of the machine consists of a 4-unit coil and accumulator which

Digitized by Google

is of sufficient capacity to supply ignition current for an extended length of time, and also to light the lamps on the car. At the same time, a specially constructed, McKee dynamo is mounted on the left side of the motor, and positively driven from the shaft which actuates the air compressor. It is fully housed, and runs at rates which vary with the engine speed, a specially devised magnetic cutout acting to break the line circuit whenever the voltage exceeds the amount required for feeding the coil. The accumulator is "floated on the line," and serves to equalize the current supply, at the same time receiving frequent charges.

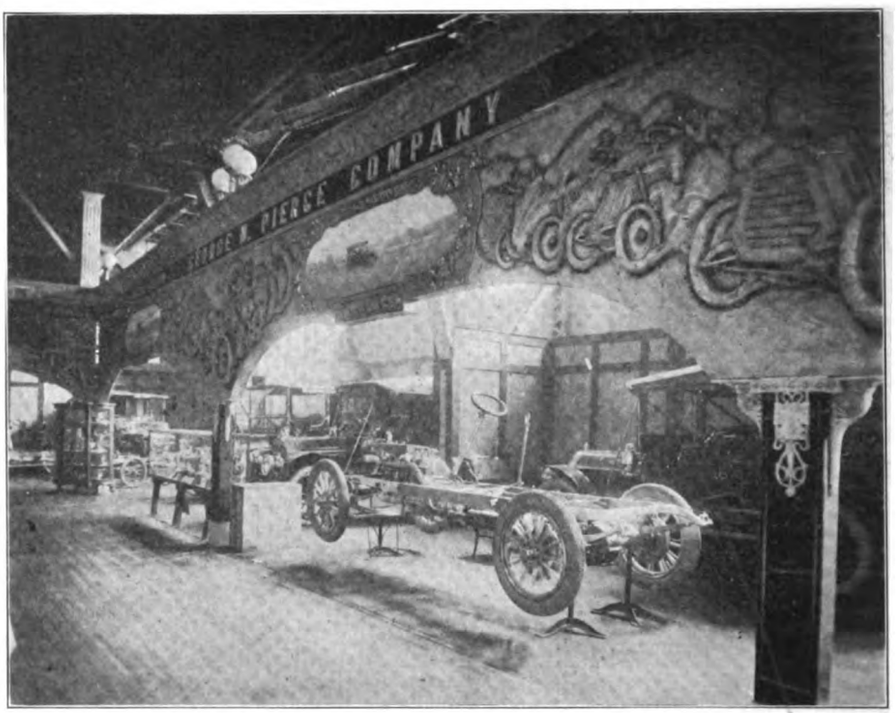
Aerocar's New Brake Equalization.



Two touring cars and one touring runabout comprise the 1908 line of the revived Aerocar Motor Co. Both touring models are practically replicas of last year's cars, except for sundry betterments of comparatively insignificant nature. The third model is a runabout, with new body lines of natty appearance and mounted on the chassis which is used on the 20 horse power car, altered sufficiently to suit the conditions of its use. The wheel base of this machine is 105 inches, and it is shod with 34 by 3½ inch tires. The wheel base of the touring car of the same power is 100 inches and it is shod with 32 by 3½ inch tires. The general features common to both these machines are: Four-cylinder, vertical, air-cooled motor, 4 by 4 inches, bore and stroke, multiple disc master clutch, sliding gear and shaft transmission affording three speeds forward, and shaft drive to the bevel gear floating differential, and hind axle.

The large touring car, which has a 40 horsepower, 5 by 5 inch water-cooled motor, has been altered somewhat since last year, but without changing its main specifications noticably. It is equipped with 34 by 4 inch tires, and runs on 115 inch wheel base. One of its new features is a novel system of brake equalization which embodies directly the principle of the bevel differential. To this end, the rocker arm which actuates the individual brake rockers connected to the bands outside the rear wheel drums, instead of being articulated to them by means of a short balance beam, as is most commonly done, carries at its outer extremity a small bevel pinion which is free to revolve upon it, and which engages on either side a corresponding bevel segment, one of which is mounted on each of the rocker arms. In this way, while the motion of the main rocker arm is transmitted at once to both of the brakes, they are permitted a certain amount of relative motion, which the bevels automatically compensate, invariably furnishing an even distribution of the retarding effect between the two wheels.

Pungs-Finch and Its Sliding Dogs.

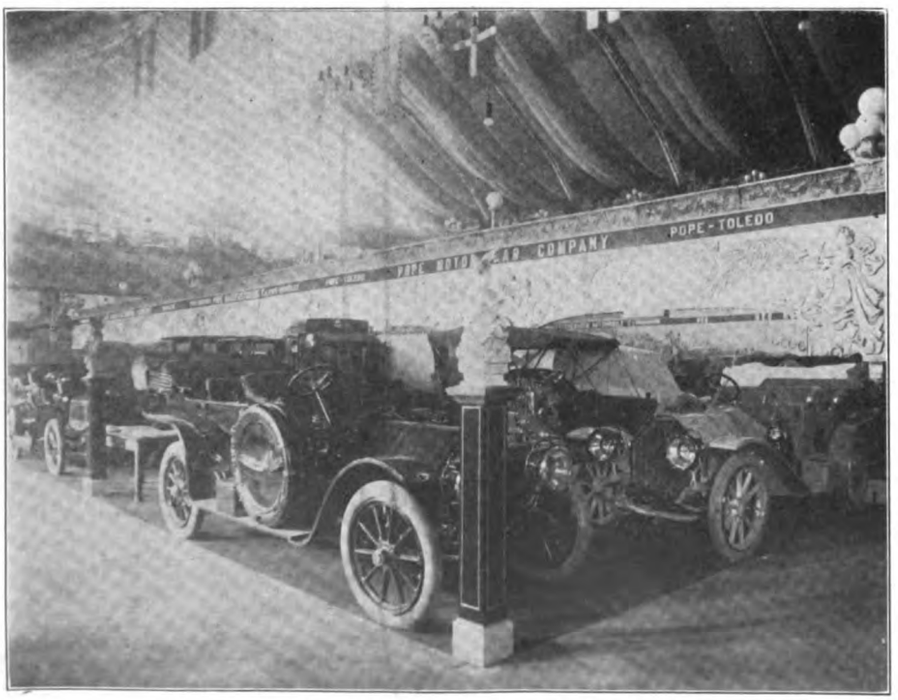


Of the two types of Pungs-Finch, on view, one, known as Model H, has these specifications: Four-cylinder vertical motor, 4½ by 5 inches bore and stroke, rated at 28-32 horsepower; transmission by multiple disc clutch, three-speed selective type change gear, with direct connection on the high, and shaft drive to the full floating type rear axle. The wheel base is 106 inches, the wheel and tires sizes are 32 by 4 inches, front and rear, and the weight is 2,400 pounds. Model 35, on the other hand, has a 40 horsepower, 4¾ by 5-inch quadruple motor; is similar to the other in general design, and has the same specifications as to wheel base and tire sizes, but with its touring runabout body, weighs 2,200 pounds.

Two points of novelty are observable in connection with the change gear set, the arrangement of which is somewhat different from that usually found, in addition to which, the use of keyless, hexagon shafts for all sliding gears, is an interesting provision. The chief feature of remark, however is the method of obtaining the second and third speeds by means of sliding dogs, whereby it is possible to change either up or down, and at any rate of car speed without danger of stripping the gears. To this end, the gears on the lay shaft are mounted loosely and are held constantly in mesh with their mates on the driving shaft, connection with the shaft being obtained by means of the dog, which locks one or the other to the lay shaft, according to the speed required.

Digitized by Google

In order to balance the weight on the runabout, the motor is set further to the rear than in the touring car, the radiator thus being brought slightly back of the front axle. This constitutes practically the only difference between the two models, save that of the power element. Both scroll end full elliptic springs and semi-elliptics are employed, but their use is practically interchangeable between the two models, and is directed by the option of the purchaser. Neither car has been altered from last year, except in minor ways.

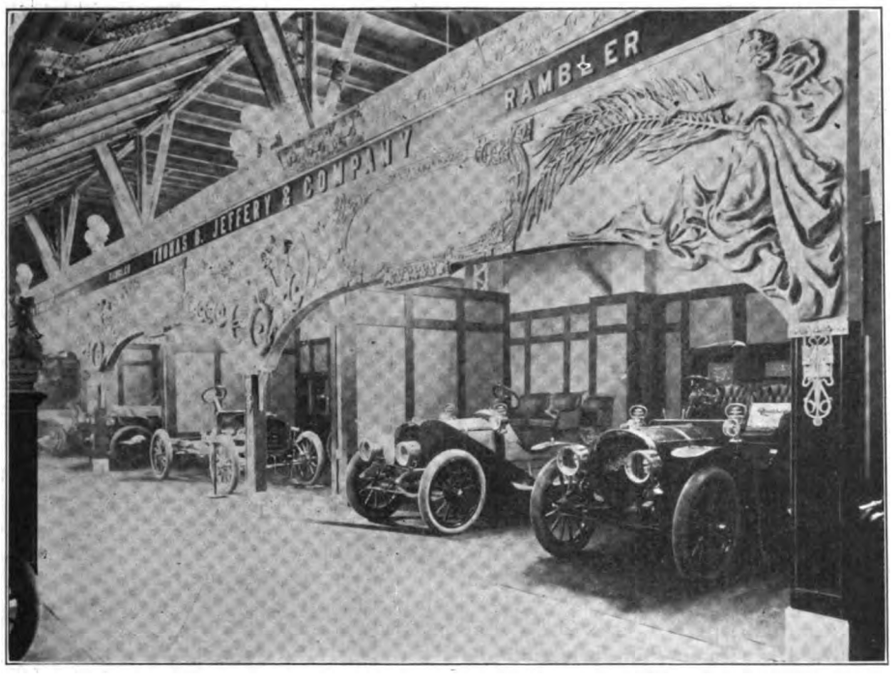


C. I. V. Full of Distinctiveness.

One of the newcomers at the show is the C. V. I., a six cylinder car of the general straight line type of body design, of broad and roomy construction, weighing some 2,600 pounds, and running on 36-inch wheels, shod with 3½ and 4-inch tires, front and rear, with 117-inch wheel base. This is one of the "new material" cars, as is shown by the use of a special vanadium alloy in the spring steel, as well as the liberal use of annular ball bearings. In addition to this, the general effect of the machine is decidedly out-of-the-common, in that it is set extremely high off the ground, and is completely enclosed underneath, the under pan even being headed up at the rear, and provided with drainage plugs, so that no oil can be spilled on the road, while, by the same token, no dirt can find its way into the bearings.

The motor, which is rated at 40 horsepower, has 4 by 5-inch, T-head cylinders, cast in pairs, with jackets integral, and takes its rating on the basis of a normal speed of 1,200 revolutions per minute. Ignition is double, with one set of plugs, a Bosch magneto and six unit Connecticut coil being provided, with accumulators as primary source. The crank shaft is mounted in seven bearings in all, the five inside bearings being plain, and bushed in Parsons white metal, while the front support is a single ball bearing, and the rear bearing is also of the annular type, but doubled, to take care of the load on the fly wheel end of the shaft. The crank shaft itself, is of 1¾-inch diameter, made in chrome nickel steel, heat treated and ground

A point of original design is found in the mounting of the cam shafts, which are placed in independent housings, quite apart from the crank case, and so constructed that the shafts may be removed without interfering with the adjustment of the crank shaft or its bearings in any way, and without disturbing the setting of the motor in the car. The method of driving the cam shafts also is worthy of note. The ends of the shafts are squared, and over them are fitted driving dogs, carrying six longitudinal pins, which fit corresponding holes in the faces of the two-to-one gears—the latter being loosely mounted on the shafts. The driving dogs are held on the squared portion of their shafts by means of locking nuts and washers. By this means it is possible to secure any desired variation in the timing of the valves, without the necessity of altering the seating of any keys, "spotting" of the shafts, or otherwise fitting the valve gear. Valve seating, throughout a wide range of possible alteration, thus is made merely a matter of adjustment.



The gear housing, like that protecting the cam shafts, is made to be removed without disturbing the motor in any other respect, and, in fact, the entire power plant, is designed to be taken down piece-meal, if necessary, without disturbing any parts but those it is desired to get at. In addition to these features, may be mentioned, the use of an "equal path" water manifold in the cooling system, which is similar to that used in the intake piping, a method of splash lubrication which provides for uniform distribution of the oil between the cylinders, several crank pits, by reason of a distributing manifold led below the crank case from end to end, and equipped with a gauge glass, as well as the adjustable nature of the fan, the pitch of which may be altered to suit temperature conditions.

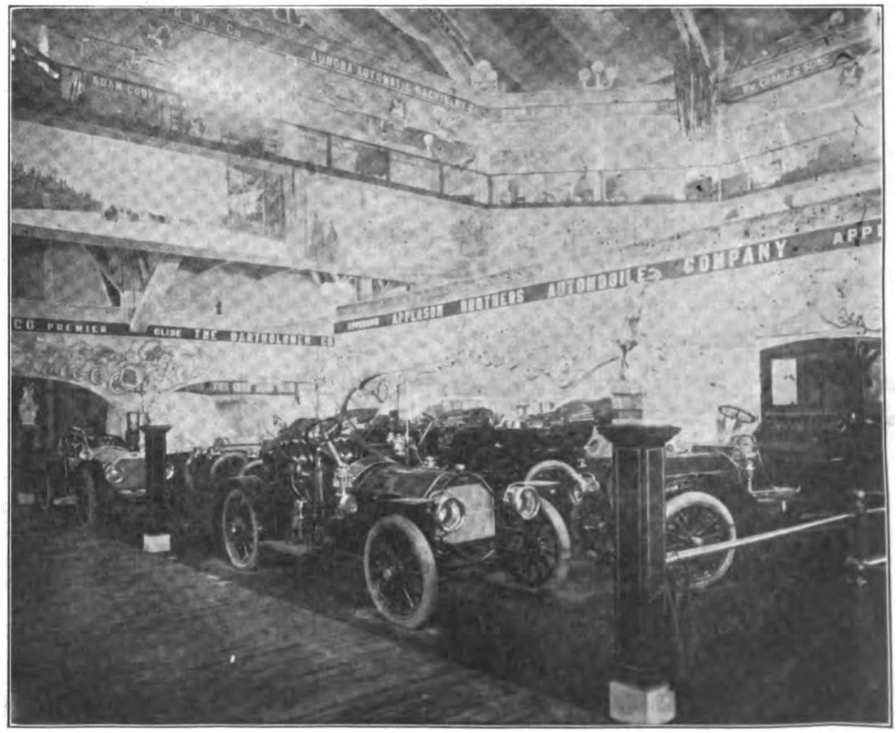
Lauth-Juergens's Unusual Option.

A most unsual option is offered to the prospective purchaser of the Lauth-Juergens car, in that practically the same machine in all other respects, may be had with motor either of the T-head or straight cyl-

Digitized by Google

inder types. In the case of the T-head motor, the cylinder dimensions are 5 by 5½ inches, and the rated output, 45 horsepower. The straight cylinder motor, on the other hand, measures 5 by 6 inches, bore and stroke, and is rated at 50 horsepower. The former is of rather conventional pattern, has individually cast cylinders, four-compartment crank pit, long crank shaft bearings, and has its cam shafts mounted in five bearings, to prevent any possibility of distorsion. The straight cylinder type, however, embodies some little novelty in the method of fitting the valve gauges in the cylinder heads, as well as in the manner of connecting the inlet and exhaust manifolds. The valves are actuated by means of overhead walking beams, and are of large area.

Another novel feature of this car is found in its master clutch which is of the disc type, having but a single live, and two dead plates, one of which is a fibre disc, and the other a metal disc, to which it is bolted and which, while compelled to turn with the fly wheel, is held away from it a very short distance by means of four light springs. The action of engagement, which is effected by means of a set of dogs, forced outwardly by a cone under spring tension, is to clasp the fibre disc between the live and dead metal plates. The light springs back of the dead plate, however, tend to relieve the crank shaft and flywheel of any end shock due to the engagement. The clutch has an enormous amount of surface, works under comparatively light spring pressure, and is claimed to be extremely sensitive and durable.



The gearset is of the somewhat rare compound type, in which part of the changes of speed are obtained by positive dogs, and part by the usual sliding pinion movement. In this case, the low and reverse speeds are obtained by means of a single sliding gear, while the third and fourth are developed by means of a single sliding dog member on the driving shaft, which engages either of two gears loosely mounted on it. A special feature of the dog clutches is that alternate teeth on both male and female members are made a fraction of an inch longer than the others. As a result of this a positive lock is secured at the first effort at engagement, as is claimed, all chattering and burring of the teeth thus being eliminated.

The general specifications of the car include, wheel base, 118 inches; wheels, 36 inches diameter, shod with 4½-inch tires; semi-elliptical springs; shaft drive; floating type axle, straight line type seven passenger body. The car is designed to be driven largely on the high gear, which it is stated, is made possible by the special form of clutch.

Aurora is Nearly Automatic.

One of the lighter cars, designed throughout on original lines, and adapted for the use of the owner of modest proclivities, and for whom it is particularly well suited, is the Aurora, which also presents the unusual feature of being outfitted with either pneumatic or solid tires at the option of the buyer. It has many of the strong points of the "big" cars, such as unit power plant supported on three points, shaft drive, three-quarter platform suspension, and simplicity and continuity of design. Its principle specifications are these: Motor, double-opposed. 4½ by 5-inch bore and stroke, rated output 20 horsepower; change gear, planetary, affording two forward speeds and the reverse; double jointed cardan shaft, "spring drive," the torsion strains only being taken up by the torque rod; wheel base 80 inches; wheels, 32 by 3 inches, front and rear alike; it tips the scales at about 1,500 pounds.

The power plant is supported by means of studs taking hold of the cylinder heads, and seated in the frame, and of a pedestal bearing on a cross member of the frame which supports the driving shaft just back of the change gear group. This same member, which is of peculiar shape, also serves as support for the brake bands on the change gear, and gives considerable rigidity to the frame. The speed control is by means of a side lever which applies the high and reverse speeds, while the low forward speed and the brakes are controlled by

Digitized by Google

means of a second foot pedal. In this connection, the construction of the brakes is of interest, in that the single pedal movement serves to apply both external and internal bands on drums attached to the rear wheels. To this end, short equalizing levers are connected to the respective bands, so that the pull applied to its center is evenly distributed between them.

It should be observed that the entire power plant of the Aurora, is placed in front of the dash, and is therefore, thoroughly accessible. In addition to this, a number of unique provisions render its regulation and repair an essentially simple matter. Illustrative of this, is the use of claw-like cams for applying the brake bands on the transmission, which, instead of being secured permanently to the frame, merely rest upon it. Adjustment of the brake tension is made by shortening the connecting linkage, and the application of the pull on the bands is obtained by prying the cam ends of the levers against the frame. The original features of the car are by no means confined to the immediate mechanism of the power plant, however, even the radiator being of a special pattern, with vertical tubes of triangular cross-section, staggered, and designed at once for strength, and cooling efficiency. Water circulation is by thermo-syphon action, and the car is as nearly automatic as the limits of its design permit.

Suspension a Pullman Feature.

The application of a name, long familiar in connection with transportation by rail, to a road vehicle, in the case of the Chicago-built Pullman car, is given to a well-drawn car, about which its makers make the somewhat radical claim that it is so very thoroughly built that not simply will it not wear out in four or five years, but that its owner will have no cause to feel out of style in driving it five years after its purchase, any more than on the day it leaves the shop. Nor is there any apparent cause for doubting the reasonable nature of the claim. The machine is, in the main, of conventional model, and has the following general details: Motor, 5¼ by 5½ inches, bore and stroke; rated at 50-60 horsepower; selective, sliding gear transmission, with contracting band clutch and shaft drive; wheel base, 120 inches; wheels, 36 inches; tires, 4 and 4½ inches diameter, front and rear.

Of the points which are most dwelt upon by the makers, the use of independent three-point suspension for motor, gearset, and rear end of frame, is the most important. The motor is hung by means of a manganese bronze yoke, taking hold of the sides of the crank case toward the front, and reaching forward to a fore and aft bearing on the under side of the radiator cradle, the rear end being supported by means of two very heavy arms, resting directly on the frame, there being no sub-frame. The gearset is hung by a similar yoke at the fore end, its point of support being a cross frame member just back of the clutch, while the rear end is hung from both sides of the frame. The rear of the chassis has the not unfamiliar three-point platform mounting, with radius rods adapted to take up the traction strains.

The motor has a ¾-inch offset in its cylinders, unusually large valves, bevel gear fan drive, with friction clutch to prevent damage to the gears owing to sudden changes of motor speed, and a very large exhaust manifold, which is provided with expansion joints between the cylinders to prevent straining the motor by alternate expansion and contraction of the pipe. The latter, which is 3 inches in diameter, is led to the rear of the car without contraction of area, and by very gradual bends.

The clutch is fully housed in a drum made integral with the fly wheel, and the selective mechanism of the gear shifting arrangement which also, is fully housed, is provided with an interlocking device which engages the pull-out rods of the gearsets whenever the clutch is engaged, thus preventing inadvertant misuse of the gears. The third of the four forward speeds in this device, affords the usual direct through connection. Five brakes are used and are applied externally and internally to the rear wheels, and to the transmission shaft. The rear brakes are equalized by beams extending entirely across the chassis, with direct center draught, and are intended for regular service. The fifth brake is actuated by an independent pedal on the extreme right side of the footboard, purposely placed out of the way of ordinary use, where it will be available only in case of extreme emergency.

Oakland Proves a Good "Find."

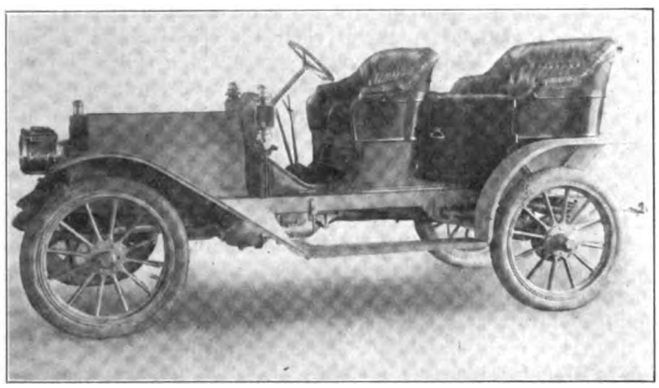
Of all the moderate priced cars, none is more fetching than the Oakland, which is but just making its debut. It is the latest product of the hand of A. P. Brush, and embodies many of the features characteristic of his other achievements. This car, unlike the others, however, makes no departure from tradition in its outward appearance. but is a complete reproduction in miniature of what might be termed a composite of the smart American touring car of 30 horsepower. Its two-cylinder vertical motor is rated as 20 horsepower, and the vehicle, complete in touring form, weighs 1,650 pounds. At its price, $1,500, with top and lamps, it looks like an unusual bargain.

Of its more intimate details, the following may be mentioned: Motor, twin, vertical, water cooled, 4½ by 5 inches, bore and stroke, balanced by crank weights and auxiliary counterbalance; floatless carburetter; thermo-syphon water circulation; transmission, planetary, with a single group of idle pinions, which are counterbalanced; fully enclosed, and mounted directly on the driving shaft to the rear axle, the entire power plant being inclined to afford a straight line drive under normal conditions; tubular axles, original steering gear, semi-elliptic springs in front, and full elliptic in the rear; oak frame, reinforced through the waist, single lever speed control. Furthermore, a point which is of particular interest in connection with the production of a car of this general type, either with runabout or touring bodies, the equipment furnished with the Oakland is complete in every detail, and proportionately equal to that supplied with any of the high priced and elaborate machines of the day.

The wheel base is 96 inches, and the tire sizes may be either 30 or 32 by 3½, according to the option of the purchaser. The runabout body is of the straight line type, with the usual rumble box in the rear, the lines of the touring car following the same general principle. The general appearance of the machine, which, as already stated, follows accepted practice in the delineation of the larger cars, is surprisingly gratifying in the face of the frequently inharmonious and discordant results of attempts to produce a car of moderate size at a proportionate cost.

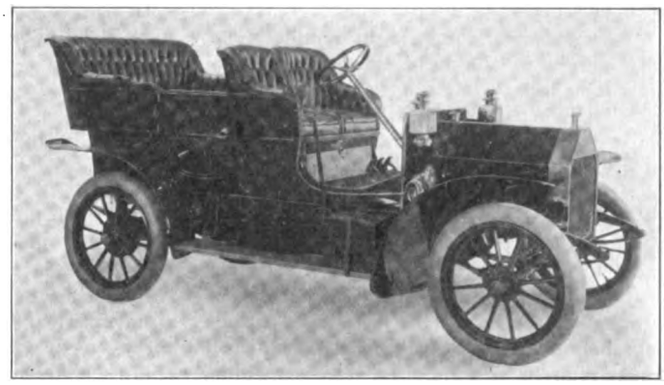
Diamond T is a Real Roadster.

One of the most smartly designed runabouts of the road-scudding type, is the new Diamond T, which is the latest addition to a line, shown for the first time, one year ago. The touring car and limousine types are based upon what is practically a reproduction of last year's chassis. The roadster, however, is entirely new, and unlike perhaps a majority of the roadsters staged at the show, has been designed from starting crank to tail light bracket with a view to its exclusive use as a two passenger roadster of the practical touring type. Among its unusual features are the use of a gravity feed fuel tank of oval section, mounted back of the seat, its cradle embodying a very respectable amount of storage space. Considerable additional storage room also is obtained by the use of a trunk, placed in the rear of the frame, which also serves the purpose of a chauffeur's seat upon requirement. The front mud guards are supported at the forward end by means of a bracket fitting in a socket on the frame, while at the rear, they are hinged to the broad step, which takes the place of a running board. As a result of this, when it is desired to gain access to the engine for any reason, one of the guards is simply released from its bracket support and inverted over the rear guard, the effect being the same as though it were completely removed.



In the braking equipment of this machine all four of the rear wheel brakes are applied simultaneously by means of either the foot pedal, or the emergency lever—the latter also disengaging the leather-faced cone clutch. The brake links are articulated to the ends of a short equalizing beam on each side of the car, the pulling connection being applied at the center of this vertical member. This equalizes the pull on the two brakes on each wheel, while the braking effect is evened from wheel to wheel, by means of a long beam stretching clear

Digitized by Google



across the car, the actuating force being applied at its center.

Another unique feature of the car is its spring suspension, the rear members being practically flat, though of the construction usually termed semi-elliptical. They are 56 inches in length, and are equipped with two damper leaves placed on the upper side. On account of the low mounting of the frame, the sills are "kinked" over the rear axle, to give the proper clearance.

The specifications of the roadster are: Motor, 45 horsepower, with cylinders 5 by 5 inches; three-speed selective change gear; shaft drive; wheel base, 114 inches; wheels, 36 inches diameter, shod with 4½-inch tires. The touring car has 124-inch wheel base, and a 4¾ by 5 inch, 40 horsepower motor, connected to a progressive type change gear. Otherwise it is much the same as the roadster as far as general arrangement is concerned. Both cars are mounted on Timken roller bearings, the change gear group also being mounted on roller bearings.

MONARCH

AUBURN

Originality of the Monarch.

Of several interesting and original points in the design of the Monarch cars, which are entirely new models this season, perhaps the most appealing to the average observer is the arrangement of the unit-power plant which is mounted on a three-point support, and besides being fitted to withstand the usual mechanical stresses of road service, also has been treated in a manner which, several years ago, would have been termed "fool-proofing" it. The result is an attractive looking machine, of few external parts, well protected mechanism, and an effective disposition of its vitals.

The basis of the three-point suspension system adopted is a sound one. The center of the front end of the frame, as being the approximate center of longitudinal frame distorsion, is taken as one of the three points of support, while what approximates pretty nearly to the center of the frame fore and aft, is taken as the transverse axis of support, the frame sills being given the load at this point. Motor and change gear are bolted strongly together, the juncture being so arranged as to include a sizeable housing for the master clutch. The gear case is supported entirely by this housing.

The rear axle group is peculiar and very ingenious in that instead of the usual torque and radius rod group, or torque member and spring drive, an attempt is made to compensate for the radial tendency of a semi-positive rear spring mounting by means of a linkage giving an approximately vertical motion to the rear axle as it responds to spring deflection. To this end the front ends of the rear springs, instead of being shackled to the spring hangers in the usual way, or bolted directly to them, are attached to one leg of the forked end of the radius rods, which in this case perform simply the function of distance pieces and correcting members. The other leg of the forked ends is attached to the spring hanger in the usual way. The end of the so-called distance rod, thus replaces the spring shackle and resembles it in general form, except that it is made integral with the distance rod. The latter, however, instead of being articulated to the axle in common fashion, has an intermediate joint, which permits it to vary its alignment. Under spring deflection, the effect of this arrangement is to compensate the usual radial motion of the axle due to its radial motion about the front spring hanger, as a center. The torsion tube is hinged to the rear end of the gear case, and so takes its support from the three-point mounting of the power plant.

Two types of car are turned out upon the same chassis, namely a roadster runabout, and a touring car. The specifications of the chassis are: Motor, 4¾ by 5 inches, bore and stroke, rated at 40 horsepower; T-head cylinders, with intermediate expansion joints in the exhaust piping; double ignition by magneto and accumulator; clutch, multiple disc, large diameter rings, bronze and iron; change gear, three forward speeds, with direct connection on high, lay shaft stationary on high speed, sliding sets locked when out of engagement, selective operation; transmission and axles of original design, mounted on Timken roller bearings; wheel base, 112 inches, wheels 36 by 4 inches, front and rear.

Auburn Shows Improvement.

Both the runabout, known as Model K, and the Model C, touring car shown at the exhibit of the Auburn Automobile Co., are based upon the same chassis. Structurally, it is but little altered from the type shown last year, and presents the following features: Double opposed motor with 5¼ by 5-inch cylinders, rated at 24 horsepower, and mounted under the body; transmission by planetary change gear and centre chain to the live rear axle, which is mounted in roller bearings; wheel base, 100 inches, and wheel and tire sizes, 32 by 3½ inches.

As is the case with a large number of car makers this year, the Auburn company has provided a more roomy body for its 1908 product than was offered last year. The new body design follows the popular straight line idea. The new radiator, which is of original design, also contributes to the thoroughly modern air of the car. The low rakish body of the runabout type, with its single box rumble seat, is also perfectly in line with the present style, and is a great improvement over anything which its makers have offered hitherto.

Pierce Racine in Three Models.

Of the three general types of Pierce-Racine exhibited, Model "E" only, is new this year. In a general way it is similar to the other cars, except that it is a little less powerful, correspondingly lighter, and is in that way better suited to the purposes of some users than the heavier type. The specifications include: Motor, 30-35 horsepower, four-cylinder, vertical, and built in accordance with the tenets of current design; change gear, three-speed, progressive; transmission by shaft, to floating type rear axle, mounted in ball and roller bearings. The wheel base is 106 inches, and the tires are 34 by 4inches. The body is mounted on semi-elliptic springs, 41 and 49 inches in length front and rear, and is of straight line design.

The larger model has a 40-45 horsepower motor, much the same features in general,

Digitized by Google

as Model E. but has longer springs, and heavier parts where the increase in strength which that implies is required. Model D, also is made in the form of a roadster runabout, the same sort of body being adaptable to the smaller car if required. The roadster body is trim and clean cut, follows the straight line pattern of the touring body, and provides the usual storage accomodation for chauffeur and impedimenta on the rear deck.

Mason's Control Forms a Feature.

Although not new, and but little altered from last year—if at all—the Mason car is entirely new to the show, and also presents a number of individual features which serve to place it well to the front among vehicles of its general class, that is to say, those having opposed motors placed under the body, planetary gears, and center chain drive.

The motor is of the straight cylinder type, with valves in the head, mechanically actuated by long push rods, and is provided with an exhaust compression release, used for starting purposes, which is operated by an endwise movement of the cam shaft, brought about through the rotation of a face cam, which displaces it against the resistance of a spring, and permits the exhaust lifters to rise over special cam faces provided for the purpose. The motor is mounted to the left of the frame, the change gear being to the right, and the fly wheel approximately in the center of the machine. The high speed clutch is of the leather-faced type, seating directly in the fly wheel, and is of unusually large diameter.

The method of controlling the transmission is unique, in that a braking effect is obtained by depressing either of the two pedals, or pulling back the side lever. The left hand pedal is designed to apply one set of brakes, also disengaging the clutch. The right hand pedal actuates the reverse transmission band, thus producing a braking effect when the car is in forward motion. The lever which controls both high and low forward gears, also controls the rear wheel brakes when drawn back to its extreme position, thus making a third means of retardation. A neat mechanical provision in the lever connections, makes it impossible to engage the low gear when drawing the lever out of its high speed position, without first returning to the neutral.

The specifications of the machine are: Motor, 5 by 5 inches, bore and stroke, rated output 24-28 horsepower; chain drive to center of rear axle, Hyatt roller bearings in rear axle, ball bearings in front axle; wheel base, 94 inches; tires, 32 by 3½; weight, 1,850 pounds. A neat, straight line, five-passenger body is provided, and the fuel and stores are carried under the hood.

Perfection's Change Gear Option.

Another of the new comers, not only to the show, but to the buying public as well is the Perfection—a medium weight four-cylinder touring car, of generally standard proportions. It is somewhat out of the ordinary in respect to its change speed gear, which may be either planetary or sliding pinion in style, according to the option of the purchaser, the choice being permitted under a slight difference in cost between the two types of gearing.

Its details may be summed up as follows: Motor of 4⅜ by 4⅞ inches, bore and stroke, valves on the left side, jump spark ignition, splash lubrication, rated output, 30-35 horsepower; drive by shaft to floating rear axle; wheel base, 116 inches; tires, 32 by 4 inches; weight, 2,400 pounds. It is suspended on Triple Action springs, has a pressed steel frame, external band brakes on the rear wheels, and emergency brake on the transmission.

Western Roadster a Newcomer.

In the Western Roadster is to be found a typical light running vehicle of the present popular type, fitted with a neat body carrying two passengers and having a combination rear, which may be used as a simple storage box, as a single or double seat, or may be removed entirely leaving a flat deck behind, as required. It is propelled by an 18-20 horsepower motor of the front horizontal opposed type, having cylinders of 4½ by 5-inch bore and stroke, respectively. The motor is cooled by thermo-syphon circulation, and is directly connected to a three-speed change gear of the selective, sliding pinion type, the motor and change gear being embodied in a unit mounting of the fully enclosed type, and taking its support through the cylinder heads which are carried by the frame sills, and a cross frame bearing at the universal joint just back of the gear box. The enclosure of the plant, also includes the fly wheel and master clutch, and the arrangement is simple and neat appearing. The gear of the frame is supported on 48-inch low set springs, while the semi-elliptical front members are 40 inches long. The Western is a new car, never before exhibited, and in fact, is only just ready for the market, its appearance at the show coming practically unheralded.

Refinements of the Halladay.

Although it has been built for several years, the Halladay touring car is absolutely new to the Chicago and other shows, and consequently is of interest on that account, if for no other reason. As compared with its prototype of last year, it stands on a 10-inch longer wheel base, has a new and improved type of motor, and is otherwise improved in several respects. It mounts a roomy body and differing from most of the "jobs" of its class in that the back of the front seat is upholstered instead of being finished in common with the exterior surfaces. This provision, while adding something to the comfort of the occupants while traversing rough country roads, as it doubtless may, also is of advantage in that it removes from the tonneau all varnished surfaces, and relieves its occupants of any sensation of being confined in a compartment which is liable to be marred unless duly avoided and protected.

The specifications of the machine include the motor, which has a rated output of 35-40 horsepower; the change gear and transmission, which are by sliding pinion gear set, affording three forward speed changes, and a short coupled, direct acting, bevel gear drive; the wheel base, which is 118 inches, the tires being 34 by 4 inches, and the weight, which is 2,650 pounds. As appears to be a growing custom among a large class of makers, the regular equipment of the car is complete and includes two 9-inch searchlights, in addition to the dash lamps, tail lamps, horn and tools.

Byrider Electric a Trim Rig.

But one of the several newcomers at the show proves to be of the electric class, this being the Byrider Electric, which is a trim, low-hung, victoria runabout, with full victoria or stanhope top, and comfortable upholstery. Its running weight is 1,650 pounds, and it has these general characteristics: Wheel base, 72 inches; tires, 32 by 3½; springs, full elliptic rear and semi-elliptic front; transmission, by noiseless gear reduction and double chain drive to the rear wheels, both front and rear wheels being mounted on Timken roller bearings. while the transmission is hung on imported ball bearings. The electrical equipment comprises a single series-wound, 2 horsepower motor, a 24-cell battery of the 9 M V Exide type, a continuous torque controller, affording five speeds varying from 6 to 22 miles per hour, left hand control with side lever steering gear, double internal brakes on the rear wheels as well as a transmission brake, and the usual safety provisions and equipment of lamps and electric meters. The mileage is catalogued at 40 per charge on high speed, and 70 miles on the second speed.

Price Runabout Proves Radical.

In the light runabout exhibited by W. C. Price, is found an extreme and altogether startling novelty in the shape of a two speed and reverse, combination friction and belt drive. The vehicle itself is of the small runabout type, weighing only 700 pounds, and equipped with single seated body with top, and a box behind which may be used as a rumble seat if desired. The motor is air-cooled, double opposed, has cylinders 3¼ by 3¼ inches, bore and stroke, and is rated at 10 horsepower.

The change gear comprises a horizontal extension of the crank shaft, and a secondary or driven shaft below it, communicating with the live rear axle through the usual cardan shaft, but so contrived that by moving the side lever. its distance from the main driving shaft directly above it, may be altered to suit the required conditions. Each of the two shafts carries a two-step cone pulley, of respective diameters of 4 and

Digitized by Google

6 inches, the steps being reversed on the two shafts, as in the case of the speed cones commonly employed in shop practice. The shafts are connected by double belting adapted to establish the driving relation whenever the lower shaft is dropped low enough to secure the proper tension. Shifting the belt from one set of pulleys to the other, as effected by means of a regular belt shipper, called into requisition when the tension is released, has the effect of altering the driving ratio and so "changing speed."

The reverse is obtained by means of a pair of friction wheels, brought into engagement when the lower shaft is raised to its full height of travel, the forward driving belt at the same time running idle and loose, and kept free of the driven pulley by virtue of its centrifugal force. The driving member of the reverse friction group consists of a wedge pulley of end wood, while the driven member is a grooved sheave of simple cast iron. The car has 98-inch wheel base, and in stock models has 30 and 32-inch wheels, shod with 1½-inch solid tires. The show car, however, is equipped with 28 by 3-inch pneumatics.

MOTOR BUGGIES.

Last year it became evident for the first time not simply that there was a field for

KIBLINGER

the high wheeled motor buggy and that it was "taking hold," but that the manufacturers were evincing an interest in its advancement, no less persistent than the response of the buying public was ready. These conditions are now so well established that interest in this unique type of vehicle has become general and very extended. The show boasts a coterie of no less than eleven machines, of which the prototype of its class—the Holsman—the Schacht, the Reliable Dayton, and the Pontiac, have already been shown this year in New York, along with others of their kind.

Duer the First Four Cylinder Buggy.

Of those which are new as far as the present show is concerned, probably none is likely to attract greater attention than the forthcoming type of Duer, in which is installed for the first time in any vehicle of the sort, a four-cylinder V-type motor. This radical innovation of the radical, despite its apparent leap into the realm of the mechanical extremes, nevertheless is not so very complex in reality, and as a matter of fact, is adapted to go into the same chassis as the present Duer twin motor type.

The 22-24 horsepower motor itself is an original device. The cylinders are 4 inches, bore and stroke, air cooled, and the valves

BUGMOBILE

are mechanically operated, the exhaust being located in the heads, opened by means of walking beams and push rods from the single cam shaft, while the inlets are placed in offset pockets, and are worked from beneath by direct thrust. Two fans are provided for cooling purposes; one—belt driven—is placed in the usual position at the front of the machine, while the other is embodied in the fly wheel. The motor has a three-point mounting, which is effected by means of two tubular members reaching from side to side of the frame. The forward tube is attached to the crank case above the shaft, by means of two suitable lugs, while the rear end of the crank case is hung from the second tube by means of a collar which completely surrounds the rear crank shaft bearing. The transmission is the same as that used during the past season on the Duer cars, that is to say, a special form of multiple bevel drive, affording two forward speeds and a reverse, with cable drive to the wheels.

The complete vehicle shown, is driven by the regular 12 horsepower opposed motor used in the 1907 cars, and differs from that machine only in point of a very few details. These have been confined principally to alterations in the design of the body, such as reducing the width of the seat, shortening the over-all length, and otherwise compacting it.

The Staver carriage stands out in a somewhat conspicuous and very "up-to-the-minute" light, owing to the use of vanadium steel in its make-up. As compared with the machine shown for the first time last year it reveals a number of alterations, of more or less significant nature. The two-cylinder water cooled motor is 5 by 5 inches in cylinder dimensions, instead of 5 by 4½ inches as last year. The rated output is 20 horsepower. The wheel base also has been increased 7 inches to 78 inches, and the tire sizes have been increased from 1⅜ inches, to 1¼ and 1½ inches, front and rear. The body is 5 inches longer than before, and full elliptic springs with scroll ends, are now used in the rear, instead of the semi-elliptic equipment. The present springs are shackled at both ends, and the driving strains are taken up entirely by means of suitable distance rods. The back axle is cranked some 3 inches, in order to lowar the center of gravity of the body.

As in the former model, the driver sits on the left side of the vehicle, steering by means of a side tiller, and controlling the machine by two pedals and a suitable gear lever on the steering column. The pedals are now of the piano lever type instead of the push plate pattern, however, and one or two other alterations of like significance have been adopted. A new mechanical lubricator has been applied to the motor, the fly wheel is now 22 inches in diameter, and it is further provided with fan blades designed to clear the body of the heated air, making the seat more comfortable in warm weather. The use of vanadium steel is confined to such fittings as the new sprocket

STAVER

mountings on the rear wheels, which are of lighter pattern than has been used before, to the spring shackles and other connecting parts of the carriage work which are likely to be subjected to severe loads.

Odd Cooling System of the Columbus.

One of the newcomers in the buggy field and one which appears entirely unannounced at this show, is the Columbus, which is a typical specimen of its class, chain driven, carefully built, and original in design. It has a two-cylinder, air-cooled motor, of 10 horsepower, placed on the right side of the vehicle under the seat, and driving the rear wheels independently through side chains. The change speed gearing is of the sliding pinion type, affording two forward speeds and the reverse, and is compactly mounted in close connection with the motor.

Digitized by Google

A peculiar feature of the cooling system is the use of an outward-flow turbine construction for the fly wheel fan. The periphery of the wheel is pierced with a number of rectangular openings which form the outlets for a number of curved blades which conduct the heated air radially outward and deliver it at the rear of the motor compartment, a close-fitting pan under and around the front of the wheel serving to confine the induction to the space surrounding the cylinders. The wheels are 42 and 46 inches in diameter, shod with solid rubber tires; the wheel base is 80 inches, and the total vehicle weight is 800 pounds.

The Solidly Constructed Federal.

The Federal, which also is being shown for the very first time, embodies probably more solidity of construction than any other of the buggy machines. This is revealed most noticably in the case of the motor mounting, which consists of a cast iron bed plate, from the under side of which the crank case and cylinders are hung. This arrangement is in part necessitated by the type of transmission employed, which consists of an aluminum alloy disc, attached to the fly wheel and driving a fiber follower wheel which is mounted on a longitudinal shaft, communicating with the live rear axle through a veritable cardan shaft and enclosed bevel and differential group. The speed ratio is controlled by a side lever, the application of the driven against the driving discs being regulated by a pedal. A second pedal controls the contracting brake on the rear wheels. The vehicle has a heavy pressed steel frame wheel steering gear, full elliptic springs, and is mounted on annular ball bearings throughout. Its specifications are: Motor, 12 horsepower, opposed, air cooled, straight cylinder type; wheels, 35 inches diameter, shod with solid tires; wheel base, 76 inches; weight, 1,175 pounds.

Flexibility of the Chicago.

The new Chicago motor buggy possesses the somewhat unusual feature of extreme flexibility in its specifications, the object being to provide the purchaser with just the machine be requires without burdening him with any greater cost than is absolutely necessary. Thus while the cheapest arrangement listed comprises tiller steering gear, steel tires, and a plain, open box body, by the addition of solid rubber tires, wheel steering, a top and more complete equipment in other ways, the same vehicle in its essentials may be made to serve a far different purpose from what it is suited to accomplish in its most elementary set-up.

The principal specifications of the Chicago line are: Motor, opposed cylinder, air cooled type, rated at 10 horsepower; planetary change gear, pedal controlled; center chain drive to live rear axle; wheels, 38 inches diameter, shod with 1⅛-inch steel oval edged tires, or rubber tires as an extra option; wheel base, 65 inches; suspension by full elliptic end springs. On the two larger of the three models produced, a 12 horsepower, 4⅛ by 4¼ inch motor is employed, together with a slightly heavier equipment all around. The three styles of body supplied are known as the buggy, trap and surrey.

Reeves and Its Friction Development.

The high-wheeled runabout shown for the first time by the Reeves Pulley Co., while a complete and well designed vehicle in every respect, is introduced quite as much as a tangible demonstration of the possibilities of using the new Reeves motor buggy power plant in other machines of this description, as with the idea of making direct sales of the Reeves complete vehicle. The power plant is a new construction embodying an entirely novel development in the friction transmission line, and it is the intention of the makers to place it on the market for the use of carriage makers, rather than to confine themselves exclusively to the building of the complete rig, of which only a limited number will be produced.

The motor is of the opposed, air cooled type, placed in the center of the frame, has valves in the heads, worked by walking beam and push rod gearing, and is supported by a fore and aft cradle between two cross frame supports. The transmission is in complete duplicate. That is to say, the friction driving pulleys are doubled, one set driving each of the rear wheels through side chains, so that no differential gearing is required, and also in the event of a broken chain, or otherwise damaged driving mechanism, the vehicle will not necessarily be disabled. The friction surfaces are aluminum alloy and tarred paper.

The drive is obtained by moving the counter shaft in such a way that the two-step pulley which it carries on each of its disconnected ends, is brought into contact with a similar pulley on the crank shaft. The primary contact gives a low speed drive. For the high speed, the low speed pulleys on the motor shaft, are telescoped inside the high speed driving pulleys, so that the low speed driven pulleys will not make contact when the counter shaft is brought into place. The reverse is obtained by means of an idler, brought into contact between the normal driving and driven members.

Bugmobile with Controlled Differential.

Another vehicle which is designed quite as much for carriage builders as for direct sales of the complete vehicle, is the new Bugmobile, which is a substantial looking victoria carriage, with comfortable seat and full leather top. It has an unique system of transmission by individual chain from motor shaft to counter shaft, and special self-lubricating cable to the rear wheels. The selection of the two forward speeds is made by mean of a positive clutch locking one or the other of the two countershaft sprockets to its shaft. The reverse is secured by bringing the outside of a third chain, which runs from the crank shaft to an idle sprocket, into contact with a special sprocket on the counter shaft. The application of power to the rear wheels is secured by moving the rear axle a very slight distance fore and aft, and just sufficient to regulate the transmission system.

The most unique feature of the machine, however, is the use of a special form of controlled differential which is actuated by the steering gear. To this end a set of links control the position of the rear axle—subject, of course, to the fore and aft tensioning movement, already described—and so regulate it that whenever the front wheels are deflected in ither direction, the driving cable on what then becomes the inside wheel of the turn, is slacked sufficiently to release the wheel and permit it to rotate at whatever speed is demanded by the turn. The mechanism is so contrived that the clutching and differentiating actions may go on irrespective of one another. The Bugmobile is driven by an air cooled, opposed motor of 12 horsepower, has 40 and 44 inch wheels, shod with 1¼-inch solid tires, 74-inch wheel base, and Timken roller bearings on all four wheels.

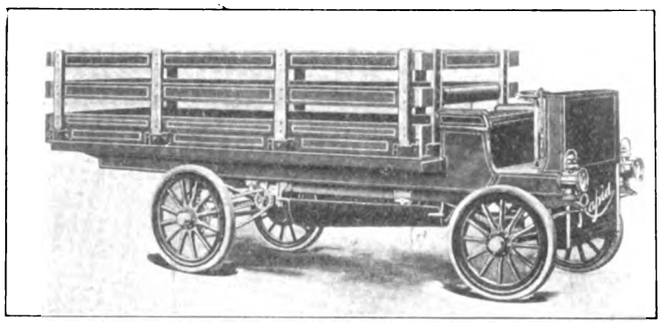
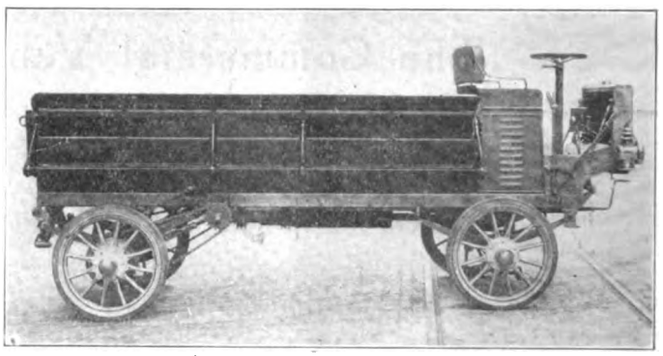
The Commercial Vehicles at the Chicago Show



VIEW IN TATTERSALLS BEFORE FIRE DESTROYED THE DECORATIONS

As has already been indicated, the commercial section, while marking a new era in show history, and probably in the progress of the commercial vehicle in this country as well, is not distinguished by any degree of overcrowding. Visitors at all times have plenty of elbow room in the Seventh Regiment Armory—the old Tattersalls—while to the number of empty spaces which were unprovided for in the original allotments of stands, are added also at least three others, left vacant by the defection of proposed exhibitors. Happily the unfortunate incident on Tuesday morning was not of sufficient moment to close the doors for more than half a day in all, the resumption of business in the evening being at once a credit to the management, and revealing but slight loss to the show as a whole—despite the loss of the bunting sky.



Of the score and more of makers showing commercial vehicles several have already exhibited in New York this year. Among such exhibits are the neat little one ton Franklin stake truck, with its air-cooled, vertical, four cylinder motor, concealed under the driver's seat, sliding gear transmission and worm drive; the Thomas taxicab and chassis, which attracted so much attention at the Garden because of the compact design of its block type motor; the exceedingly practical looking Brush delivery, with its unique construction throughout; and the Pope-Waverly electric delivery wagons and light stake truck. These stand out as conspicuous examples of the possibilities of light construction, coupled with a fair capacity for speed.

Among the heavier vehicles which already have made their bow to the show visitor, the massive electrics of the Studebaker line, together with the attractive hotel bus, which also drew attention in the Garden, are good examples of what may be done where heavier loads are to be carried. The Reliance trucks, which are distinguished by the interchangeable features of their two-cycle motors, are shown on the adjacent stand, and call attention to the fact that it is a practical impossibility to design a motor equipment for any vehicle such that it will respond invariably to the demands of commercial service. Across the hall, the large exhibit of Rapid vehicles, embody-

RAPID TRUCK

RELIANCE TRUCK

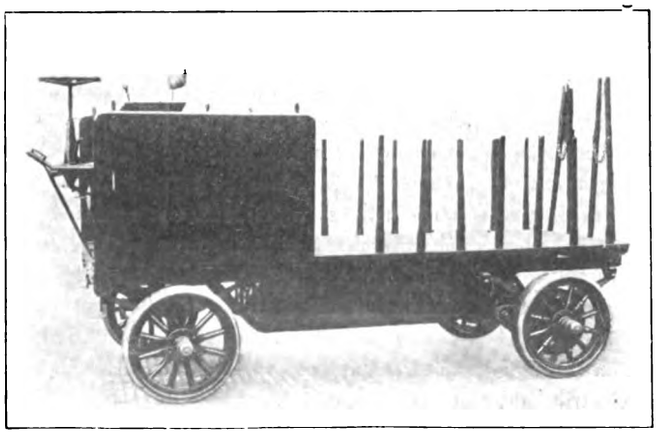
ing a wide range of application of the motor car to the commercial field, and in eleven different styles, and also revealing a wide variety of uses for the two distinct chassis of 1½ and 1 ton capacity, respectively, is a valuable object lesson in itself.

For the purposes of the utility vehicle, friction drive is held to be especially suitable on account of its simplicity, since, apart from questions of its efficiency, it generally gives less trouble in the hands of careless or unskilled operators than any other type. It is typical of the growth of this feeling that no less than five of the makers staging in this part of the show boast this feature among others in their exhibits, the method of transmission being, in each case, essentially the distinctive element in the vehicle. It is further of importance to note that no two of these are alike in method of application, though the principle always remains the same.

Simple Control of the Meiselbach.

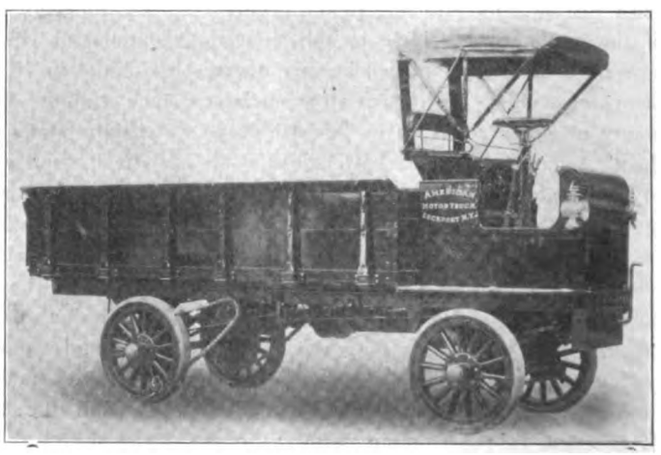
While the Meiselbach car has but one speed in either direction, its transmission is of substantial construction and not liable to get out of order. On a line shaft coupled direct to the engine crank shaft, are two bevelled tarred paper pinions, fitting on splines so as to be capable of movement into or out of engagement with two large grey iron beveled surfaces. The discs carrying these surfaces are keyed solid to two independent cross shafts so that they revolve in opposite directions when driven. They are backed up with ball bearings to take the thrust. To correct for their opposite direcion of travel, the motion of one of the cross shaft driven mebers is reversed through a pair of steel spur gears to a parallel sprocket shaft. The advantages of this arrangement are that there is no side strain on the drive shaft and the engaging friction surfaces having the same level, there is no cross slip between them, due to varying diameters of contact. There is a very slight slip, however, as no differential gear is provided and this is intended to provide for the different speeds of the drive wheels in rounding corners. The two chains are necessarily different lengths.

The control is very simple, the forward speed pinion being engaged by lever at the driver's seat. The reverse is operated by pedal, as are also the powerful band brakes on the periphery of the large friction discs. The motor is 28 horsepower. horizontal, double opposed, with a large fly wheel. A large force feed oiler located on top of the crank case furnishes the lubrication. The stripped chassis on view is of 1 ton capacity.



Worth with no Fly Wheel.

The Worth, another distinctive car, has a four-cylinder engine, of 5 by 6 inch bore and stroke. It has no fly wheel, the two large revolving disc members of the transmission acting as such. Between these two flat discs are two friction wheels, fiber rimmed and splined to shafts—directly coupled to the sprocket shafts through universal joints. When one wheel is engaged with the forward disc, the other is similarly engaged to the rear one.



The driven wheels are thrown into or out of engagement with the discs by means of a lever at the driver's side, a motion of about two and one-half inches in this lever being sufficient to go from the forward to the reverse directions. The lever is held in place in the forward position by ratchet and pawl. The rear wheels are driven by large silent chains. Speed is varied by moving the two friction wheels toward or away from each other. This is done by two opposed racks with a pinion between operated by a hand wheel on the steering column. Large band brakes on the rear wheels are operated by a ratchet foot lever.

Unusual Form of Motor in the Weeks.

The Weeks system of transmission is somewhat similar to others of the same genral class in that there are two large friction discs keyed to the drive shaft with a pair of friction wheels operating between them. These wheels do not swing in the same way as any of the others. Instead, they are splined to the two sprocket shafts which in turn revolve in pivoted yokes. These yokes swing in a longitudinal plane bringing the wheels into engagement with either the forward or rear discs as desired.

STUDEBAKER TRUCK

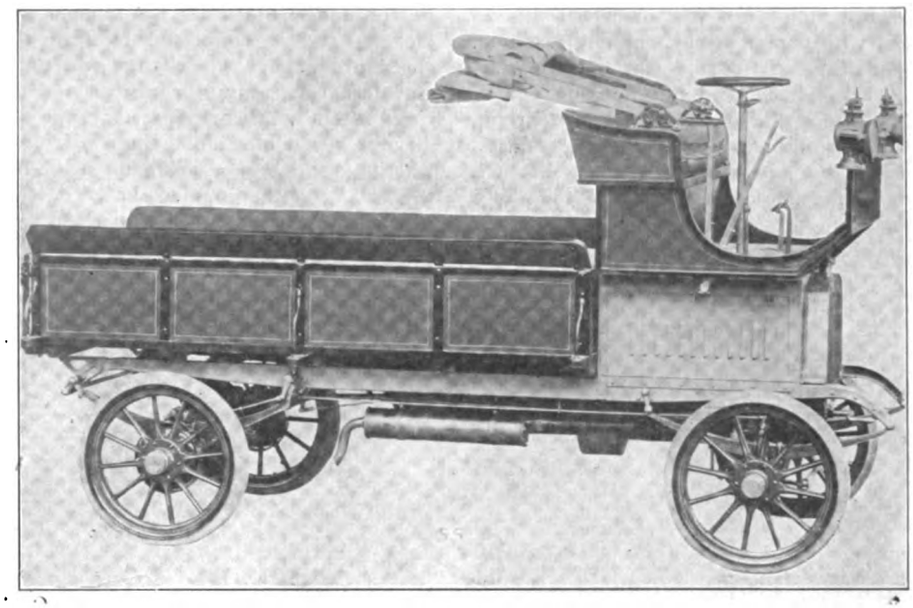
AMERICAN TRUCK

Digitized by Google

one wheel engaging one disc while the other wheel engages with the other disc. This plan has a tendency to slightly tighten or loosen the chain, but avoids the use of universal joints. Control of the gear is by two pedals, one for forward and one for reverse motion. The wheels are moved toward or away from the center of the discs by a hand lever to give the variable speed effect.

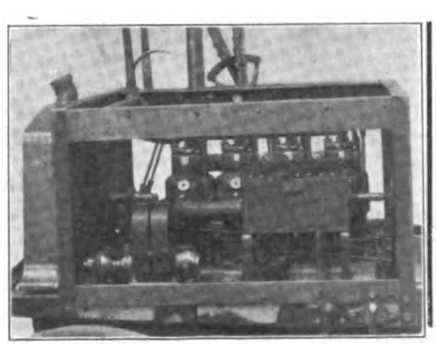
A novel and altogether unusual form of air-cooled two-cycle motor is found in this machine, which, as is claimed, is based on original patents of a revolutionary nature. The essence of its action depends upon a measure of internal as well as external cooling, which is effected by causing the gas to traverse a labyrinth in the under side of the piston as it is transferred from the crank case to the cylinder at the end of the exhaust. The mixed vapor and air, coming in contact with the heated surfaces of a number of baffling ribs cast in the piston, is merged into a complete gas and thoroughly mingled by agitation. A secondary effect of the system is that the heat absorbed in completing the vaporization of the charge in this way, is removed from the cylinder thus effecting a lowering in cylinder and piston temperatures, which results in a working cycle of unusual completeness chemically, and excellent mechanical results, as far as regularity of action, and throttle action are concerned. The cylinders are square externally, liberally provided with cooling flanges, and measure 4 inches, bore and stroke. The rated output is 20 horsepower.

Lambert Mechanism Well Protected.



The type of friction gearing employed in the transmissions applied to the Lambert vehicles, already is familiar in its application to the pleasure vehicles produced by the same makers, and of unquestionable success. The same system in somewhat modified form, is employed in the massive newspaper delivery wagon staged just opposite the main entrance to the Armory. But two elements are employed in this device, namely a driving and a driven disc, the latter, mounted on a counter shaft, free to move endwise upon it, and securing its contact with the driver through the motion of the shaft toward or away from the motor which the driving disc serves in lieu of a fly wheel.

The vehicle in question is noteworthy in respect to its mounting on indestructible steel wheels, as well as for the use of the complete metal housing of the transmission by a metal under pan of rigid construction. Another feature which is of interest in its way also, is the use of a curved metal fender running across the front of the vehicle and serving at once as a buffer and guard for the tubular radiator. The motor, which is of the four-cylinder, vertical type, is completely housed under the foot board and driver's seat, the entire mechanism of propulsion of the vehicle thus being at once hidden from view and rendered as unobjectionable as possible, and protected from dust and dirt as well as liability to injury from external sources at the same time.



Worm Drive of the Mitchell.

One of the most salient features of the Mitchell truck is the worm drive, which affords a six-to-one reduction in speed, allowing a maximum speed of 15 miles an hour in the equipment displayed at the show, and gives an ideal smoothness and certainty of action in hard usage, such as can be obtained in no other way. The machine in question, which is of original and purely commercial design save for the motor, is rated at 1 ton capacity, is driven by a 20 horsepower, four-cylinder, vertical motor and has a sliding gearset, with straight line propeller shaft to the worm group on the live rear axle. The wheel base is 110 inches, and the wheels are 30 inches in diameter, shod with 3 and 3½ inch solid tires, front and rear.

A second machine on display, which is intended for delivery purposes and therefore requires greater speed capacity and flexibility of movement than the truck, is mounted on a chassis of more nearly conventional touring car form. It has its motor mounted in front of the driver's seat, under a regular hood, and carries a covered van body of neat and pleasing proportions.

MITCHELL TRUCK

MITCHELL POWER PLANT

Features of the American.

In connection with the subject of transmissions as applied to the commercial vehicles, it is safe to say that one of the most remarkable, because of its rarity on machines of the heavier order, is the planetary system found on the American, a massive 3 ton vehicle. The construction of this machine is extremely heavy in every point, this fact, coupled with the large size and powerful mounting of the gear housing, making it safe to assume that the interior parts of the spur planetary gear are equally beyond the limit of of any possible strain—that is to say, were such an assumption required in the face of the accomplished performances of these vehicles during the several years in which they have boasted this feature.

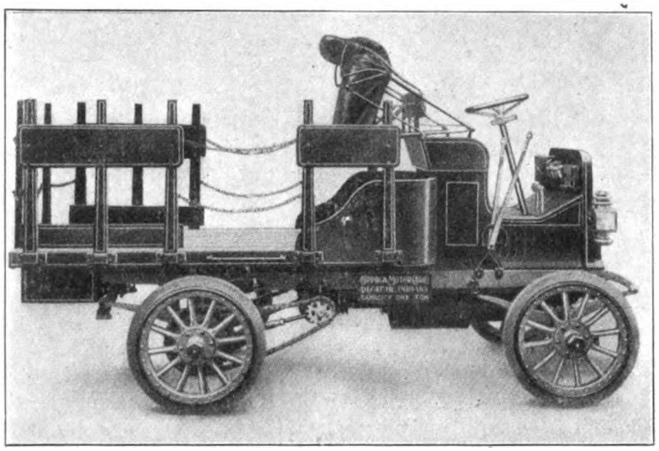
Another noteworthy point in the makeup of this truck is in the use of an auxilliary cooling surface and water storage space at the rear of the vehicle, in the shape of a flat coil of iron piping, laid below the floor level. Besides adding a positive assurance of ample cooling effect regardless of atmospheric or highway running conditions this addition, provides an extra 33¼ per cent. of water in the system, and safeguards the user against overheating through carelessness on the part of the driver in letting the supply run too low in the radiator.

The specifications include: Motor, four-cylinder vertical, with cylinders, 5 by 6 inches, bore and stroke, special design rendering it possible to dismount all vital parts without removing the motor from the frame or seriously dismantling it; rated output, 30-36 horsepower; double speed change

Digitized by Google

gear, double chain transmission to rear wheels, heavy bearing surfaces throughout; wheel base, 118 inches, 36 inches diameter, tires, 4 and 5 inches, sidewire type.

Friction Transmission of the Plymouth.



Still another type of four disc friction transmission is found in the case of the Plymouth trucks, in which the driving action is carried from the motor to a pair of aluminum alloy discs splined upon the driving shaft and free to slide upon it under the influence of one or the other of two pedals. Between them are a pair of driven sheaves, faced with papier mache, running fast upon a pair of co-axial counter shafts upon which they are splined, and thus making contact with one or the other of the two driving discs according to circumstances, and at a speed ratio determined by their distances from the centre of the discs. As they make contact upon opposite sides of the centre of the driving disc, they revolve in opposite directions, the required correction, necessary to establish uniform direction of motion in the two side chains which they drive, being thus secured by means of a secondary counter shaft on one side, driven from the main counter shaft by spur gears.

The advantage of this system is that no differential requirement exists, each side being driven by a complete and independent friction transmission, a secondary advantage being that the transmission will not necessarily be crippled by the breaking of a chain, or by the disabling of one entire side of the system for any reason. The forward and reverse directions of motion are obtained by drawing one or the other of the two driving discs into contact with the corresponding members on the counter shaft.

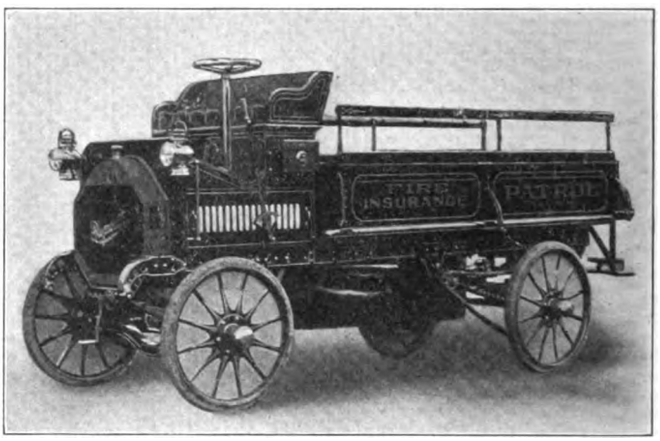
The Plymouth wagons are driven by a 40 horsepower, 4¾ by 5 inch four-cylinder, vertical motor placed low down in front under the seat. The wheels are 34 and 36 inches in diameter, front and rear, shod with single and twin solid tires, 4½ and 2½ plus 2½ inch in width, respectively. The emergency brakes expanding in drums on the rear wheels, are 16 inches in diameter and have 2½ inch width of face. The wheel base is 103 inches, and the weight of chassis, 3,800 pounds.

Coppock and Its Compact Power Plant.

The neat form of two-cycle motor employed in the Coppock truck serves to call attention to the general compact proportions of the power plant as revealed in 1 ton chassis, bared for inspection. The cylinder dimensions of this machine are 4½ by 5 inches, and its rated output is 20-24 horsepower. The motor is mounted vertically under the seat, has copper water jackets, and is connected to the three-speed, progressive type change gear through an internal expanding bronze master clutch ring, fitted with cork inserts. The final drive is by double side chain, a pair of contracting band brakes being mounted inside the frame on the counter shaft. A second pair of contracting brakes, operated by the side lever, are mounted on the rear wheels.

COPPOCK TRUCK

The wheel base is 87 inches, the wheels are shod with 32 by 3½ and 32 by 4 inch tires, front and rear, and the weight of the chassis is 2,900 pounds. The standard body is a stake platform with protecting apron at the front and sides of the carrying space, which 56 by 96 inches in floor dimensions.



Interesting Points in Frayer-Miller.

Several points of interest are disclosed by a study of the characteristics of the Frayer-Miller trucks, among them being the use of a four-speed selective type sliding pinion change gear, thus permitting the use of a high-speed driving ratio considerably above that normally applied to vehicles of its class, and extremely useful where it is necessary to make long return trips without load. This feature is so worked out that with proper gearing of the side driving chains, it is possible to attain speeds of from 20 to 40 miles per hour when running light. The air-cooling of the motor is a feature of note in this, as in the pleasure cars produced under the same name. Another point which is brought out by the makers is the option offered the purchaser between high wheels shod with single tires, or low wheels shod with twin tires, each equipment being held to have its peculiar advantages under certain conditions of services.

The carrying capacity if the standard truck is 5,000 pounds. The motor output is rated at 24 horsepower. The wheels are mounted on Timken roller bearings, and the change gear on annular ball bearings.

Three Point Suspension of the Knox.

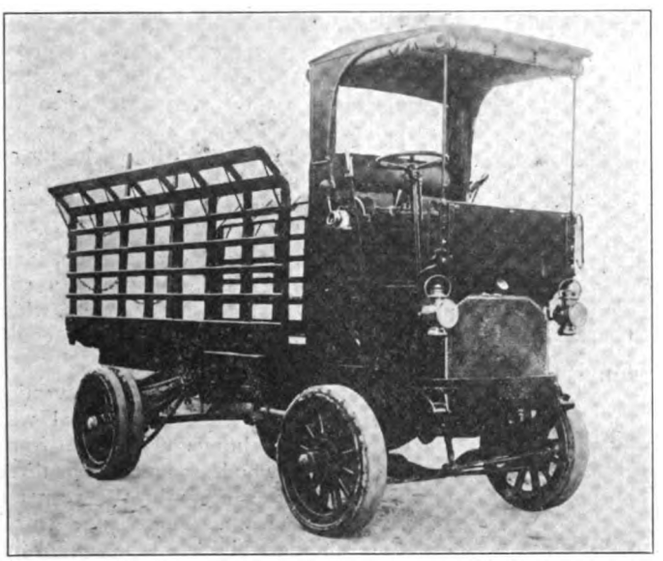
Another heavy type of vehicle, also distinguished by its air-cooling features, is the Knox, two examples of which are staged. The new 3 ton, four-cylinder truck, is driven by a 30 horsepower vertical motor, placed under the driver's seat, and driving through a three-speed, selective, sliding gearset, and double chains to the rear wheels. It has 111 inch wheel base, 36 inch wheels, shod with 4-inch solid rubber tires, and weighs 5,000 pounds. Rather an unusual feature of this

PLYMOUTH FIRE PATROL

machine, though common enough and well tried in pleasure car practice, is the use of three point suspension, both on motor and transmission supports. Another excellent feature of the power plant is the use of the continuous, flush-feed type of lubricating system. The oil receptacle is placed in the bottom of the crank case, and the feed is rendered positive and proportional to the speed of the engine by the use of a positively driven gear pump.

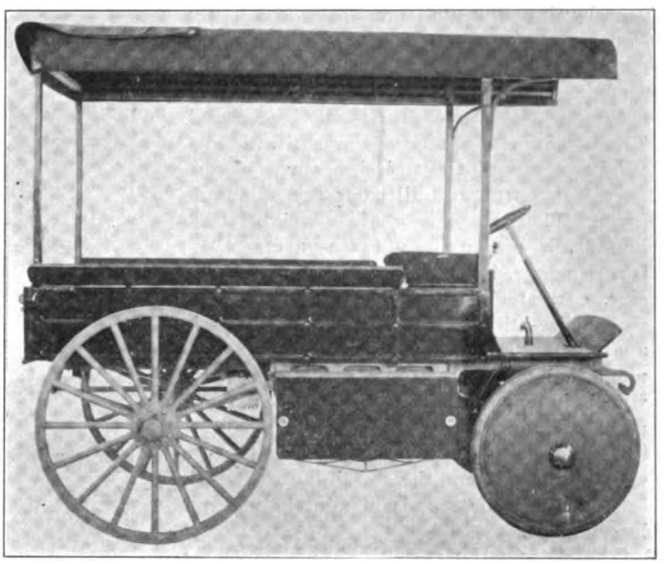
Safir, the Only Foreign Truck.

The only example of foreign vehicle construction on view, the Safir 4 ton truck, naturally attracts considerable attention. As a matter of fact, it boasts the most complete motor equipment in this part of the show, speaking from the engineering point of view, and is well worth study on that account alone. For example, the motor is equipped with a self-starting device, a compression breaking device affording something like 75 per cent. of the full power of the motor at corresponding speeds, an automatic jet carburetter, selective gearset, and other features such as ordinarily are dis-



Digitized by Google

coverable only on high grade and expensive cars.



The starting gear comprises a small compressor actuated from the main driving shaft of the vehicle, and controlled by a multiple action lever which also may be made to admit a charge of air from the compression tank under the chassis to a special manifold mounted over the motor and connecting with the various cylinders through openings over the exhaust valves. At the centre of this manifold is a rotary distributing valve having four ports, and driven from the exhaust cam shaft in synchronism with the motor thereby admitting the charge of air from the manifold to the cylinder next in order of firing through one of several ports cored out of the manifold, and leading directly to the respective cylinders.

The braking system, which is absolutely unique, and has been in use for some little time by its makers in mountain work, both for trucks and passenger 'busses, consists of a method of advancing the exhaust cam shaft through 90 degrees, and simultaneously closing the throttle damper tightly at the carburetter, also opening communication through the intake manifold, to an extra discharge pipe leading back to the muffler. The action is entirely under the control of the throttle lever, which is mounted over the steering wheel, and is brought into play when that member is brought around through some 90 degrees of travel beyond the ordinary position of closed throttle. The effect of thus advancing the exhaust timing and connecting the intake pipe with the exhaust drum, is to convert the motor into a two-cycle air compressor. That is to say, with the throttle in the braking position, no gas is admitted to the cylinders, but instead, there are alternate compression and induction strokes, the release at the end of compression coming in each case, just about as the piston commences to descend. As a result of this, two pistons are continually rising against compression, and two falling under conditions of induction, either from the inlet or exhaust manifolds, and the relative power of the brake is dependent on the timing of the valves, which, in turn, depends on the position of the lever.

The motor is of 30 nominal horsepower; the wheel base is 153 inches; the complete vehicle weight is 5,500 pounds. The body is mounted on a number of cross mebers placed edgewise on the main frame, and is elevated to what is to the American eye, an awkward height, but one which, nevertheless, permits the body to clear the tops of the wheels, thus providing a clear load-carrying space of 11 feet by 6, floor area.

ONE OF THE MACK TRUCKS

COUPLE-GEAR ELECTRIC

Innovation on the Couple-Gear.

No little interest attaches to the unique system of motor drive applied to the Couple-Gear electric vehicles, its use being most significant as employed on the 5-ton truck with four-wheel drive, although the more novel application to the front wheels only of the new light delivery vehicle is calculated to attract almost as much attention, because of the consequent and unusual appearance of the vehicle in question.

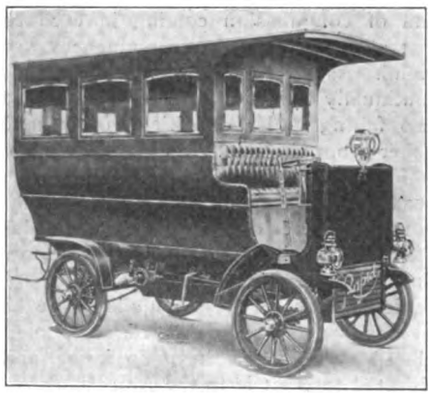
The principle of the Couple-Gear system, embodies the use of a very compact form of electric motor, mounted within the enclosure of a double saucer disc driving wheel, with a pinion on either end of its armature shaft engaging one or two bevel gears mounted inside the wheel, but on opposite sides. The motor is fixed to the axle and kept from revolving, and by a special differential contrivance located in the armature shaft, the transmission losses are reduced to an extremely low minimum. The total rated motor output of the machine is 12 horsepower, the overload capacity being some 200 per cent.

In the case of the large machine, an innovation appears in the shape of a set of wood tires, which displace the solid side-wire dual rubber equipment employed hitherto. These tires consist of blocks of end wood placed over a bed of thick rubber packing material which surrounds the rim of the wheel, the blocks being held in place by the side compression of a pair of flanged locking rings which are bolted firmly in place. For this arrangement it is claimed that there is comparatively small material loss in resiliency at the slow speeds and heavy load factors employed; that they are cheap to build and inexpensive to repair; and furthermore, that such repairs may be made at any time and with slight outlay of labor upon materials always at hand. In substantiation of this, it is stated that when first applied the blocks are not specially dressed to an even surface, the effect of the road dirt and the load being sufficient to establish a good running surface within a short time.

Gifford-Pettit a New Comer.

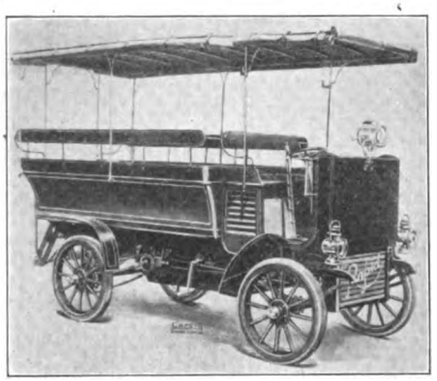
An absolutely new structure, designed to withstand heavy loading and road stresses successfully, is found in the Gifford-Pettit, which is making its first public appearance at the show. It is of the heavier order of truck design, and is rated at 3 tons capacity. Among its special features may be mentioned the use of double ignition by jump spark and make and break, with Bosch magneto, both the commutator and ignitor timing being regulated simutaneously by the spark lever; the use of complete automatic lubrication in all parts of the vehicle there being no less than 11 oil feeds, taking care of all important bearings, including the diffuse bronze castings in the lower half of

Digitized by Google



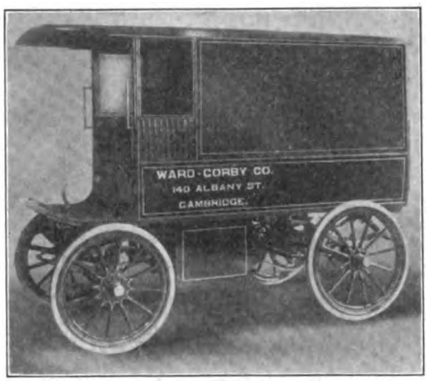
the gear case, the differential housing, and other important parts; and the use of very heavy internal-external brakes on the rear wheels.

The general specifications include: Motor, four-cylinder, vertical, water cooled, with cylinders 4¾ by 6 inches, rated output 30-35 horsepower; change gear, of the sliding pinion type, affording three forward speeds, with direct drive on the high, and the lay shaft idle; double chain drive; wheels and tires, 36 by 5 and 36 by 3½ inches, front and rear, respectively; wheel base, 120 inches; weight, 5,000 pounds, chassis alone; Timken axles and roller bearings throughout.



Pittsburg Electric Delivery Wagon.

Several exclusive and interesting features are developed in the construction of the Pittsburg electric delivery wagons, among them being, in the case of the 1,500 pound machine, a laudable attempt at interchangeability which has been most successful. There are no "rights" and "lefts" in the motor hangers and transmission parts, no unnecessary parts, and all parts are of simple form: The complete vehicle weighs 4,500 pounds, is mounted on three-quarter platform springs, both front and rear, has massive, cast steel I-beam axles, and armored wood sills—there being no separate chassis apart from the body. The electrical equipment includes two motors driving the rear wheels independently, a 42-cell battery of 11 plate cells, and 140 A. H. capacity. A Westinghouse controller, with positive reverse switch, is fitted, and the steering gear, which is of original design, is absolutely without lost motion.



The characteristics of the 750-pound light delivery wagon also shown are: Single motor driving the live rear axle by Morse silent chain; no intermediate reduction; 22 cells of 140 A. H. battery, with a guaranteed radius of 40 miles on a charge at 10 miles per hour; total weight on wheels, 2,500 pounds. As in the larger car, no separate chassis formation is employed, it being held that a certain flexibility is secured with the built-in body construction, which is desirable as conducive to smooth

RAPID OPERA BUS

RAPID POLICE PATROL

PITTSBURGH ELECTRIC

load haulage and vehicle endurance. The additional weight of the chassis, its cost, and the stresses dut to its rigidity are used as arguments against its usefulness.

Points of the Sayers & Scoville.

Among the newcomers may be mentioned the Sayers & Scoville which displays a number of points worthy of note. Among those which contribute not a little to the serviceability of the machine may be mentioned the use of a special ignition system which is original and unique. The accumulator, a spare set of dry cells, and the four unit coils, are mounted in a special box at the right side of the vehicle, and all wiring led from it is firmly secured so that it cannot chafe or work itself loose from its terminal connections. The coils are so constructed that on slipping them into the case a brass post protruding from the rear end makes contact with the proper terminals. The vibrators are readily accessible when the door of the box is open, and the arrangement is such that only the closing of the door is required to hold the entire outfit in place, the batteries being electrically connected in the same fashion as the coils. The coils are of special construction, made to order, and are adapted for use in connection with the low tension magneto, which also forms a part of the electrical equipment.

The motor is of the four-cylinder vertical pattern, located in the conventional way, and is rated at 25 horsepower. The frame is of armored wood, mounted on three-quarter platform springs in the rear and semi-elliptics in front. The change gear is of the sliding pinion type, affording three forward speeds. It is mounted on annular ball bearings with Timken roller bearings to absorb the thrusts. There are two sets of brakes, one on the rear wheels and one on the counter shaft, two bands being located, one at either end, just inside the frame. The wheel base is 96 inches, the wheels are 32 and 34 inches in diameter, shod with 3½ inch solid tires, the weight is 2,600 pounds, and the capacity rating, 3,000 pounds.

New Things Among the Parts and Accessories Exhibits

In the field of parts and accessories it is evident that the two earlier New York shows by no means uncovered the whole gamut of the 1908 offerings, for in addition to the exhibits which already had appeared in the previous shows of the season, a number of new things are disclosed by concerns that were not represented at the other function. How many uncatalogued exhibitors there are probably never will be known. The raising of the ban on subletting of space brought in a flood of small specialties; each day one or more of the modest makers of such devices rented a corner of some stand and made their bids for business.

Naturally the well known exhibitors that appeared at New York made a brave showing at Chicago, as well, and consequently the visitor finds nearly all of the sundries and accessories that he is familiar with by reputation, such as Solar lamps, Jones speedometers, Truffault-Hartford shock absorbers, Sta-Rite plugs, Index speed indicators, Harroun bumpers and the like. All of the popular tires are represented, including Diamond, Hartford, Ajax, Continental, G & J, Morgan & Wright, Firestone, Empire and Michelin. The ignition concerns are strong in numbers, prominent among the displays being the products of the Witherbee Igniter Co., the Splitdorf Labratory, the Connecticut Telephone and Electric Co., the Remy Electric Co., the Heinze Electric Co., and the Pittsfield Spark Coil Co. Exhibits of special interest to the makers of cars are also numerous, and the manufacturer or designer finds a great assortment of component parts for review in the exhibits of such concerns as the Timken Roller Bearing Axle Co., the Whitney Mfg. Co., the Midgley Mfg. Co., the Standard

Digitized by Google

Roller Bearing Co., the Baldwin Chain and Mfg. Co., the Kinsey Mfg. Co., the Briscoe Mfg. Co. and the Diamond Chain and Mfg. Co.

About the only novelty in motor design is the "Teg" two-cycle, two cylinder engine, made by the Lange-Smith Motor Co., of Chicago, which is of interest because of the claims for internal cooling that are made for it. Flanges or ribs on the lower part of the piston form a maze through which the compressed vapor mixture must pass on its way up through the piston port into the explosion chamber above the piston head. This has the double effect of cooling the piston by its contact with the mixed gasolene vapor and air, and of correspondingly warming the mixture so thoroughly as to effect complete vaporization of whatever gasolene mist or spray it may contain and preparing it for more ready and complete combustion. The cool piston inside assists the air flanges on the outside of the motor in keeping the cylinder walls from overheating. The engine is very similar to the motor used on the Weeks commercial car shown in Tattersalls, and the makers of the latter claim that the design was "borrowed" from them by a former employe.

Among the vast array of standard supplies and sundries, the Excelsior Supply Co., of Chicago, shows the Echo horn, an exhaust operated alarm having three tubes and a tri-tone chime; the Mandeville steering wheel muff, which protects the driver's hands on the steering wheel; the Universal tire protector or blow-out patch; the "Inner Shoe" for rebuilding the inside of tire casings; samples of "Triumph" grease, the special product of the Perfection Grease Co., South Bend, Ind., for automobile use; a liquid compound for cleaning cylinders of carbon, called "Carbonit"; Parks plugging specialties and rubber cement for tires; and the "Jef" valve grinding tool which operates with a crank.

In tires a radically new product is presented by the Zeglen Bullet-Proof Cloth Co., of Chicago, in clinchers in which the Zeglen fabric of silk strands is used instead of the more usual canvas. Whether this fabric would successfully prevent bullets from penetrating the tires if the latter were shot at is not made clear, but the user is given assurances that it will prevent puncture or bursting, with no sacrifice of resiliency.

An improved model of the Warner friction clutch is put on view by the Warner Clutch Co., of Chicago, and W. B. Murray, of Chicago, shows several forms of planetary gear. In the parts class the Atlas Mfg. Co., of Fostoria, O., is also conspicuous as a newcomer, with specimens of crankshaft work in which specially accurate grinding is a feature. McCord & Co., of Chicago, already well known through their established lines of force feed lubricators, their radiators, gaskets and the like, show for the first time the new McCord carburetter, which is of the "puddle" type, and a new low tension magneto. The latter, which is of very original design, is particularly suited to use on small cars. The De Souchet Motor Appliance Co., Chicago, displayed a self-starting device of some originality.

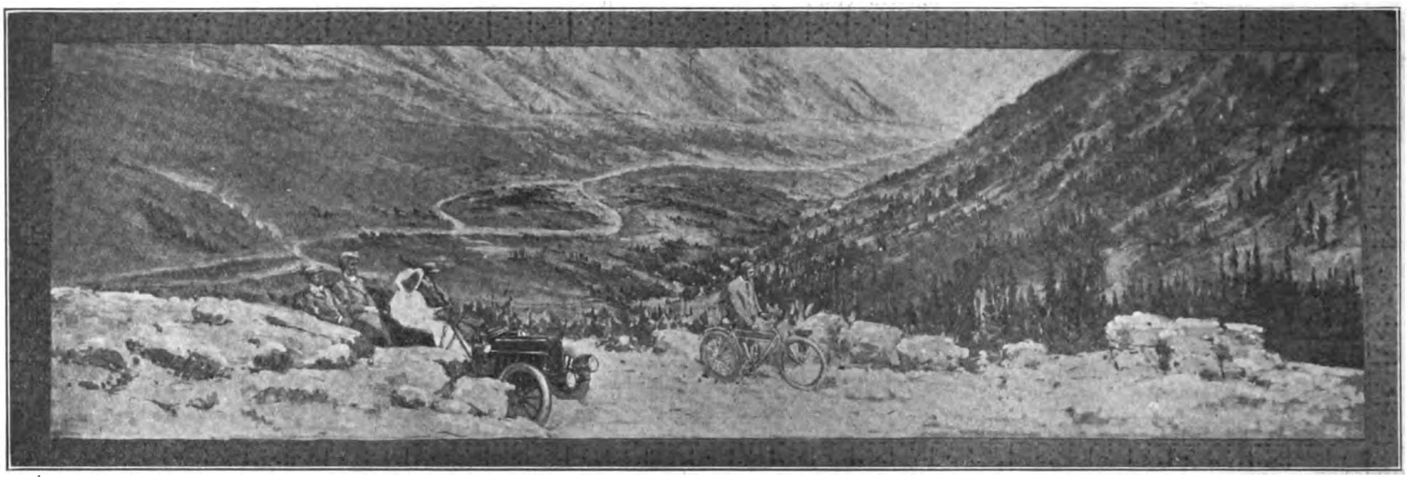
With a name based on the characteristics of the product, the Triple Action Spring Co., of Chicago, exhibits compound springs, a fact which is in itself rather out of the ordinary since the makers of semi and full elliptic leaf springs and the makers of the so-called supplementary spiral springs have heretofore been widely separated. The springs shown not only combine the usual flat springs with the spiral supplementaries, but introduce between the two a yielding spring scroll, which opens under shock stress. Road jars are taken up first by the spiral, then by the scroll, and if sufficiently severe, lastly by the flat spring. Ingenious shackles for preventing side play are provided. The springs are made up in a variety of combinations, the list including three-quarter platform springs, full elliptics and semi-elliptics.

Blue blazes, which in the vocabulary of earlier days were synonymous with extreme intensity, flash alarmingly at the exhibit of the Pfanstiehl Electrical Laboratory, Chicago, where is installed what the exhibitors assert is the largest automobile ignition coil unit ever constructed. Regular 110 volt direct current, such as is used for lighting, is employed in what corresponds with the battery circuit on a small coil, and the resulting secondary or high tension current has the qualities of real lightning. The object of the coil monster is to show the "caterpillar" flame which in a smaller way the company's coils give in automobile service. The concern, whose plant is at North Chicago, Ill., also makes other electrical specialties, which are on display.

Wind shields with wood and brass frames constitute the display of Cartier, Chapman & Co., of Ludington, Mich., in their first show appearance for the season, and Eugene Arnstein, the Chicago jobber, features in his extensive line of sundries a new, round, double generator at a moderate price and the H. P. spark plug. The Imperial Brass Co., of Chicago, makes its 1908 showing of pumps, robe rails and general automobile brass fittings, while the Long Mfg. Co., of Chicago, indicates that for the coming year it will stick to the designs which in the past have proved so satisfactory in its radiators. Tops constitute the specialty of the Longdin-Brugger Co., of Fon du Lac, Wis., and three specimens of the company's work are on view.

"Five cars in one" are shown by the C. H. Stratton Carriage Co., of Muncie, Ind., to be a possibility by the use of a remarkable body and top arrangement which by dropping and folding into various combinations gives the chassis on which it is mounted the effect of anything from a runabout or two passenger coupe to a big limousine or a Pullman sleeping car. In convertibility it excels the wonders of the combination folding bed, refrigerator, cook stove, and bookcase, which is supposed to make life pleasant for Harlem flat dwellers.

Vivax accumulators in different sizes make up the exhibit of the Vivax Storage Battery Co., of Chicago, and the Never-Miss Spark Plug Co., of Lansing, Mich., stages volt-meters, ampere-meters, volt-ammeters, Never-Miss spark plugs and a handy chain repair device. In addition to a general line of automobile sundries the Central Rubber Co., of Chicago, offers a very complete line of rubber goods specialties such as automobile rain coats, washers' aprons, top material, tire jackets, collapsible water buckets and tire repair materials. Rare gums and pigments such as are used in the manufacture of their colors and varnishes are available for examination at the space of the Standard Varnish Works, of Chicago, together with specimens of their work.



In coil construction a more or less novel design is exhibited by the Duplex Coil Co., of Fond-du Lac, Wis. The core of the coil is bent to a horseshoe or U shape so that the magnetic force of both ends of the core operates on the vibrator instead of the force from only one end. The windings around the core are arranged on the two vertical arms, in two divisions, so that externally they look like the windings on an electric bell or a telegraph instrument. The doubling of the magnetic force on the vibrator is said to permit the use of a stronger return spring and to give a consequent positivity of action.

Accumulators constitute the principal feature at the stands of the General Accumulator & Battery Co., of Milwaukee, and the Commercial Battery Co., of Chicago. The former company makes the Radium batteries and charge indicators and the latter manufactures the Combat igniter and a combination dynamo and accumulator outfit with automatic cut-off. The Hill precision oiler in its latest form, exhibited by the Precision Appliance Co., of Chicago, and the mechanical oilers of Edward Neely & Co., Chicago, are on view as solutions to the lubricating problem, and the Webster exhaust muffler, made by the Webster Muffler Co., of Galesburg, Ill., promises no back pressure and no noise. This muffler is exhibited by J. H. Baird, of Galesburg, and is quite novel. The exhaust is first broken up by a sieve-like cone, and then sifts out between flat rings composing the outer wall. A closing head at each end binds the rings together under spring tension, while a hand lever spreads the rings when desired, for "cutting out."

Heitger carburetters are explained to the visitor at the space of the Heitger Carburetter Co., of Indianapolis. Malleable steel castings, drop forgings and gray iron castings are shown by the Western Malleable Steel Co., of Detroit, Mich.

Summary of Exhibits at the Chicago Show

A SELECTION FROM THE COLISEUM "ART GALLERY"

Pleasure Vehicles.

Packard Motor Car Co., Detroit, Mich.—Packard gasolene cars.

Locomobile Company of America, Bridgeport, Conn.—Locomobile gasolene cars.

Wayne Automobile Co., Detroit, Mich.—Wayne gasolene cars.

Electric Vehicle Co., Hartford, Conn.—Columbia gasolene and electric cars.

Knox Automobile Co., Springfield, Mass.—Knox gasolene cars.

Woods Motor Vehicle Co., Chicago, Ill.—Woods electric cars.

Reo Motor Co., Lansing, Mich.—Reo gasolene cars.

Studebaker Automobile Co., South Bend, Ind.—Studebaker gasolene and electric cars.

E. R. Thomas Motor Co., Buffalo, N. Y.—Thomas gasolene cars.

F. B. Stearns Co., Cleveland, O.—Stearns gasolene cars.

Apperson Bros. Auto Co., Kokomo, Ind.—Apperson gasolene cars.

Northern Motor Car Co., Detroit, Mich.—Northern gasolene cars.

Elmore Mfg. Co., Clyde, O.—Elmore gasolene cars.

Olds Motor Works, Lansing, Mich.—Oldsmobile gasolene cars.

Lozier Motor Co., New York—Lozier gasolene cars.

Dayton Motor Car Co., Dayton, O.—Stoddard-Dayton gasolene gars.

Pope Motor Car Co., Toledo, O—Pope-Toledo gasolene cars.

Pope Mfg. Co., Hartford, Conn.—Pope-Hartford gasolene cars.

H. H. Franklin Mfg. Co., Syracuse, N. Y.—Franklin gasolene cars.

Bartholomew Co., Peoria, Ill.—Glide gasolene cars.

Waltham Mfg. Co., Waltham, Mass.—Waltham-Orient gasolene cars.

Premier Motor Mfg. Co., Indianapolis, Ind.—Premier gasolene cars.

Matheson Motor Car Co., Wilkesbarre, Pa.—Matheson gasolene cars.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y.—Maxwell gasolene cars.

Geo. N. Pierce Co., Buffalo, N. Y.—Pierce Great Arrow gasolene cars.

White Company, Cleveland, O.—White steam cars.

Stevens-Duryea Co., Chicopee Falls, Mass.—Stevens-Duryea gasolene cars.

Haynes Automobile Company, Kokomo, Ind.—Haynes gasolene cars.

Winton Motor Carriage Co., Cleveland, O.—Winton gasolene cars.

Royal Motor Car Co., Cleveland, O.—Royal Tourist gasolene cars.

Thomas B. Jeffery & Co., Kenosha, Wis.—Rambler gasolene cars.

National Motor Vehicle Co., Indianapolis, Ind.—National gasolene cars.

Babcock Electric Carriage Co., Buffalo, N. Y.—Babcock electric cars.

Mitchell Motor Car Co., Racine, Wis.—Mitchell gasolene cars.

Pungs-Finch Auto & Gas Engine Co., Detroit, Mich.—Pungs-Finch gasolene cars.

Autocar Co., Ardmore, Pa.—Autocar gasolene cars.

Dragon Automobile Co., Philadelphia, Pa.—Dragon gasolene cars.

Baker Motor Vehicle Co., Cleveland, O.—Baker electric cars.

Cadillac Motor Car Co., Detroit, Mich.—Cadillac gasolene cars.

Peerless Motor Car Co., Cleveland, O.—Peerless gasolene cars.

Imperial Motor Car Co., Williamsport, Pa.—Second Imperial gasolene cars.

Welch Motor Car Co., Pontiac, Mich.—Welch gasolene cars.

Peerless Motor Car Co., Cleveland, O.—Peerless gasolene cars.

Corbin Motor Vehicle Corp., New Britain, Conn.—Corbin gasolene cars.

Buckeye Mfg. Co., Anderson, Ind.—Lambert gasolene cars.

Columbus Buggy Co., Columbus, O.—Columbus electric cars.

Nordyke & Marmon Co., Indianapolis, Ind.—Marmon gasolene cars.

American Locomotive Auto Co., New York.—American Berliet gasolene cars.

Rauch & Lang Carriage Co., Cleveland, O.—R & L. electric cars.

Aerocar Motor Co., Detroit, Mich.—Aerocar gasolene cars.

Gearless Transmission Co., Rochester, N. Y.—Gearless gasolene cars.

Moon Motor Car Co., St. Louis, Mo.—Moon gasolene cars.

Pierce Engine Co., Racine, Wis.—Pierce-Racine gasolene cars.

Tincher Motor Car Co., South Bend, Ind.—Tincher gasolene cars.

Austin Automobile Co., Grand Rapids, Mich.—Austin gasolene cars.

De Luxe Motor Car Co., Detroit, Mich.—De Luxe gasolene cars.

Jackson Automobile Co., Jackson, Mich.—Jackson gasolene cars.

American Motor Car Co., Indianapolis, Ind.—American gasolene cars.

Chicago Coach & Carriage Co., Chicago, Ill.—Duer gasolene buggies.

Staver Carriage Co., Chicago.—Staver gasolene buggies.

Oscar Lear Automobile Co., Springfield, O.—Frayer-Miller gasolene cars.

Pontiac gasolene buggies.

Pontiac gasolent buggies.

Streator Motor Car Co., Streator, Ill.—Streator gasolene cars.

Brush Runabout Co., Detroit, Mich.—Brush gasolene runabouts.

Colt Runabout Co., New York—Colt gasolene runabouts.

W. C. Price, Harvey, Ill.—Price gasolene runabout.

Mason Car Sales Co., Kansas City, Mo.—Mason gasolene cars.

Western Automobile Works, Chicago, Ill.—Western gasolene cars.

Perfection Automobile Works, South Bend, Ind.—Perfection gasolene cars.

Buick Motor Co., Jackson, Mich.—Buick gasolene cars.

Reeves Pulley Co., Columbus, Ind.—Reeves gasolene buggies.

Rockford Auto & Engine Co., Rockford, Ill.—Federal gasolene buggies.

Byrider Electric Auto Co., Cleveland, O.—Byrider electrics.

Black Mfg. Co., Chicago—Chicago gasolene buggies.

Acme Motor Car Co., Reading, Pa.—Acme gasolene cars.

Monarch Motor Car Co., Chicago Heights, Ill.—Monarch gasolene cars.

Moline Automobile Co., East Moline, Ill.—Moline gasolene cars.

Auburn Automobile Co., Auburn, Ind.—Auburn gasolene cars.

Diamond T. Auto Co., Chicago.—Diamond T. gasolene cars.

Holsman Automobile Co., Chicago.—Holsman gasolene cars.

Wayne Works, Richmond, Ind.—Richmond gasolene cars.

Rainier Company, New York—Rainier gasolene cars.

Kissell Motor Car Co., Hartford, Wis.—Kissellkar gasolene cars.

Smith Automobile Company, Topeka, Kan.—Great Smith gasolene cars.

Bugmobile Co. of America, Chicago.—Gasolene buggies.

Chicago School of Motoring, Chicago.

F. A. Brownell Motor Co., Rochester, N. Y.—Motors.
Electrical & Mechanical Development Co., Asbury Park, N. J.
Norris Auto Co., Saginaw, Mich.—Tire protectors.
Central Rubber Co., Chicago—Tires and rubber goods.
Robert Bosch, New York, Inc., New York City.—Sims-Bosch magnetos.
Troy Carriage Sun Shade Co., Troy, O.—Tops.

Non-Stop Run in Show Window.

With a schedule calling for 180 hours non-stop running, a Franklin air cooled motor was set going Saturday night in the window of the H. H. Franklin Co.'s Chicago branch on Michigan avenue. The motor is to run during the whole period of the Chicago show. Officials of the Chicago Motor Club and other prominent representatives of the trade supervised the starting of the motor and will inspect the engine when the affair is over. The motor is being run at a rate corresponding with a car speed of about 30 miles per hour, and 180 hours would be equivalent to 5,400 miles, or as far as from San Francisco to New York and back to Omaha. Since the motor is being run indoors, the test of the air cooling feature will be peculiarly severe.

HAIR SPLITTING RELIABILITY RUN.

(Continued from page 525)

charged two points while the Maxwell, driven by J. Mitchell, suffered 610 demerit marks. The Rapid 'bus had 66 points tacked on its score. The day was not free from accidents and considerable confusion was caused when several of the cars lost the road, after the wind had blown the trail of confetti forty ways. Van Sicklen, in the pilot car, while giving a contestant a wide berth, ran into a ditch and threw one of his passengers out. The Maxwell, in attempting to get out of the way of the Wayne bumped into a curb and suffered a broken wheel which lost a number of points for it.

When all the score cards had been examined ten cars were found to have perfect scores, and these were later reduced when the officials began to hunt for scratches on the varnish, or almost as bad as that, in order to find something that would detract from the "reliability" of the cars. Ted Collier's Rambler was assessed 8 points because a speedometer bracket had worked loose, and Arthur Kumpf's Pierce-Arrow was dropped from the honor roll because a grease cup on the rear axle was found loose. A loose bolt on the drive shaft inflicted 6 points upon Ralph Owen's Oldsmobile, while R. E Parker's Auburn, which also was with the leaders, had the front wheels about a thousandth of an inch out of plumb; that irregularity cost it 10 points. Leitch's White was debited 12 points because of an apron cord had become chafed, as explained elsewhere, a trivial enough thing. W. Mitchell's Locomobile lost 12 points, William Smith's Studebaker 18 points, Webb Jay's Kisselkar 18 points, and John Aiken's National lost 26 points in the final reckoning and elimination. The score:

1	Frank Nutt, Haynes	0
2	Arthur Kumpf, Pierce Arrow	2
3	Ralph Owen, Oldsmobile	6
4	Ted Collier, Rambler	8
5	R. E. Parker, Auburn	10
6	W. Leitch, White	12
7	W. Mitchell, Locomobile	14
8	William Smith, Studebaker	16
9	Webb Jay, Kisselkar	18
10	John Aitken, National	26
11	D. Kilbourne, Silent Knight	54
12	Paul Hoffmann, Pierce Arrow	55
13	F. Holmes, Jackson	66
14	F. Leiser, Locomobile	67
15	Barney Oldfield, Autocar	74
16	Ray McNamara, Premier	78
17	John Haynes, Dragon	90
18	C. Englebeck, Stoddard-Dayton	107
19	C. Denzer, White	110

RIO PRISONERS TO RIDE IN STYLE

They Will Make Their Enforced Journeys in American Automobiles—Fine Police Outfit for Brazil's Chief City.

With an eye ever alert to the refinements of urban existence as developed in North America and Europe, the government authorities of Brazil have made arrangements whereby the dangerous or disorderly malefactors of Rio Janeiro may enjoy the same blessed privileges as offenders in heretofore more favored localities, by being conveyed to the local lockup in automobiles. The three automobile patrol wagons shown in

WHITE STEAMERS FOR THE RIO JANERIO POLICE

the accompanying illustration have just been shipped to Rio in accordance with an order from the Brazilian government. They are White steamers of 30 horsepower and have special bodies built in compliance with the specifications accompanying the order. The coat-of-arms of Brazil is conspicuously painted on either side so that even from the sidewalk it will be possible for the Rio residents to distinguish the vehicles from the private carriages, and the substantial caging will also serve to emphasize the social distinction and exclusiveness of the occupants. Fifteen passengers can be accommodated at a time. The machines are now on the high seas, on their way to South America and the criminal talent of Rio are postponing operations until their arrival with a view to tasting the delights of motoring in the event of being caught.

Pickens's Plan for a Meet Failed.

Because no one seemed anxious to assume liability for damages in case of accident, the Houston (Texas) Automobile Club saved compromising itself through lending its support to a proposed outlaw meet William H. Pickens, under suspension, and L. C. Strang had arranged to hold a meet in conjunction with the Houston Automobile Club on a recent date. The lessee of the Harrisburg track, where the meet was to have been held, generously donated the course, as the major portion of the gate receipts were to have applied to a charitable movement, but he insisted that the promoters of the meet indemnify him against any damage suits that might result from accidents, and also to put the track in good condition after the meet. As the club did not feel called upon to assume the responsibility, and naturally Pickens and Strang would not, even had they the wherewithal, the meet was called off.

Official Disapproval of Closed Roads.

Local ordinances excluding automobiles from public roads in Massachusetts are not to be favored by the State Highway Commission. This was made plain in a talk made by Chairman W. E. McClintock at the first smoker of the Bay State Automobile Association, held in Boston Saturday evening, 30th ult. Mr. McClintock's talk was along the lines of how best to bring about co-operation between motorists and the authorities in securing obedience to the laws and ordinances. About a hundred members of the association attended the smoker.

Albany Club Shows Rapid Growth.

At its annual meeting last week the Albany (N. Y.) Automobile Club elected the following officers; President, M. L. Ryder; vice-president, Dr. W. L. L. Peltz; secretary-treasurer, Chauncey D. Hakes. The membership of the club has been increased by 150 during the past year and now numbers 200 on its rolls.

Johnstown Owners Form a Club.

At an enthusiastic and well attended meeting the Johnstown (Pa.) Automobile Club was successfully launched last week with these officers: President, Charles S. Price; vice-president, W. F. Murdock; secretary, Walter Dowling; treasurer, John L. Stibbich; trustees, J. Leon Repfogle, F. B. Cook and Dr. Francis Schill, Jr.

Cleveland Club Re-elects Its Officers.

At the annual meeting of the trustees of the Cleveland Automobile Club all of the old officers were re-elected for the coming year, as follows: President, Fred S. Scholes; first vice-president, A. Ward Foote; second vice-president, George Collister; treasurer, Windsor T. White.

WHEEL TAX FOR STREET REPAIRS

Chicago's New Source of Revenue Under State Law Just Enacted—Forecast of the Tariff.

Nearly everything on wheels in Chicago will be subject to the new "wheel tax," to be levied under an act which was passed in the lower branch of the Illinois legislature on Tuesday, 26th inst., by a vote of 104 to 13. It already had been passed in the Senate, and now is in the hands of Governor Deneen, who has indicated his intention of signing it.

This legislation was inaugurated by Mayor Busse of Chicago, at whose request the bill was drafted and introduced in the legislature. He had been advocating a wheel tax ever since he took office in April last, his argument being that it offered the best means of preserving the pavements in Chicago. The measure was enacted as an amendment to the cities and villages act, and it will enable any city or town in Illinois to levy a tax on all vehicles for the purpose of raising funds for repairing streets and public ways. Attached to the bill is an emergency clause which will make the act effective as soon as it is signed by the Governor.

As soon as the measure becomes law Mayor Busse will send to the city council a message calling attention to the action of the legislature and advising the passage of an ordinance levying the taxation authorized, and fixing the rates. The amount of money to be raised by this means will be determined by the council. Mr. Hanberg, commissioner of public works, who was much interested in the measure, and Mr. Doherty, superintendent of streets, already have worked out a tentative schedule of rates. They estimate that more than 80,000 vehicles use the streets of Chicago. This estimate does not include bicycles and motorcycles, which possibly may escape taxation. Following is the way the sum works out to give Chicago a revenue of $673,000 for street repairs: Automobiles, 6,000, taxed at $20, $120,000; single horse rigs, 45,000, at $5 each, $225,000; double horse wagons, 25,000, at $10 each, $250,000; three horse spikes, 400, at $15 each, $6,000; four horse wagons, 3,600, at $20 each, $72,000. The city tax on automobiles will be in addition to the State tax of $2 already imposed.

Already there is evident a feeling in favor of discriminating against the automobile and making the tax proportionately greater than in this schedule, the arguments being based on their alleged greater destructiveness to road surfaces and the presumed wealth of their owners. Back of it, of course, is the prejudice of anti-motorists, and this class may be expected to advocate the taxation of motorcycles, if by any chance these vehicles should appear likely to escape.

GOOD TIME MADE ON LONG HILL

Southern Californians Held Thanksgiving Day Meet in Box Springs Canon—Record for the Long Grade Broken.

Southern Californians, 5,000 of them, saw the annual hill climb up Box Springs Canon near Riverside, Cal., on Thanksgiving Day, which reports from the Golden State heralded as "the best ever." There was a larger attendance than at any previous affair, a consequent increase in interest; better filled events and faster times, the record for the long grade being broken in several of the events. But more or less saddening to relate, in the free-for-all for motorcycles, Paul Derkum, riding a two cylinder machine, made not only the fastest time of the day, but established a record for the course in 4:21⅗. The best time made by an automobile was 5:21½.

The Box Springs grade is not a short hill and the cars cannot make one grand rush from a flying start and get up to the top before the engines begin to pull hard. Instead it is a long steady rise, 3½ miles long, with a gradient averaging about 6 per cent. Not all the cars reached the summit, and "dead ones" were strewn all along the route.

The event for one cylinder motorcycles started the cars moving, and C. W. Risden, Indian, made the fastest time, 5:27⅘, figures that were equalled by but few automobiles. Derkum literally ran away from the field in the free-for-all motorcycles and reached the summit in 4 minutes 21⅗ seconds after the start. This was the fastest time made during the meet.

There was considerable rivalry between the Ford and Maxwell adherents in the first event, for runabouts selling at $850 and under, but neither did what was expected of it. The Standard Motor Car Company's Ford won easily in 6:04. This time was bettered in the next event, runabouts under $1,250, by George Kussman, who drove a Tourist to victory in 5:49⅘. The Ford had no trouble in snatching second from Johnson, in a Jackson.

Frank Siefert, Stoddard-Dayton, made the fastest run in the under $3,000 class for runabouts, although it was a walkover for him, no other contestants showing up at the start. Siefert also won the under $2,500, the same time counting, and the free-for-all runabouts.

The free-for-all touring cars, which was expected to be the classiest race of the day, did not prove as interesting as the touring car race for cars under $3,000. Several of the entrants in the free-for-all did not reach the top. The event went to A. P. Maginnis, driving a Gearless, which car made its initial bow to the California public in an open contest. H. D. Pyns, White, was second. Renton and Harrison put up a great race in the under $3,000 class Harrison had made a fast run from Los Angeles in his Oldsmobile and many looked upon him to take Renton's measure, but the driver of the Great Smith car handled the levers perfectly and won by five seconds. The summary:

	Time.
One Cylinder Motorcycles.	
1 C. W. Risden, Indian	5:57⅘
2 H. Lightcap, R-S	5:50⅘
3 Charles Knoll, Armac	5:57⅗
Free-for-All Motorcycles.	
1 Paul Derkum, Indian	4:21⅗
2 W. G. Colins, Indian	5:20
3 F. B. Buenneman, Indian	5:25⅗
Runabouts Under $850.	
1 Standard Motor Car Co., Ford	6:04
2 Maxwell-Briscoe-Wilcox Co., Maxwell	7:01
3 Maxwell-Briscoe-Wilcox Co., Maxwell	7:29½
Runabouts Under $1,250.	
1 Auto Vehicle Co., Tourist	5:49⅘
2 Standard Motor Car Co., Ford	6:15
3 A. Johnson, Jackson	7:32½
Runabouts Under $3,000.	
1 Frank Siefert, Stoddard-Dayton	5:21½
Runabouts. Free-for-All.

1 Lester Pattee, Cadillac	6:12
2 P. A. Renton, Great Smith	6:27
3 Edward Cowan, Rambler	6:34
Touring Cars Under $4,000.	
1 So. California Motor Car Co., American	5:56⅗
2 H. D. Ryus, White	6:11⅗
3 A. P. Maginnis, Gearless	6:16⅗

Date Fixed for Vanderbilt Cup Race.

After transacting a little routine business of no particular moment at its meeting last Wednesday, 27th ult., the executive committee of the racing board of the American Automobile Association adjourned and immediately reconvened as the Vanderbilt Cup Commission. The most important decision arrived at was that the Vanderbilt Cup Race will be held during the fall of 1908, a resolution to that effect being unanimously adopted. The date, rules, entry blanks and course will not be announced until July 1st next, but the entry fee will remain the same as in former contests, $1,000, with double fee between the closing of entries on September 1st and October 1st. It is expected that enough of the Long Island motor parkway will be completed in time to permit of holding the race upon it.

NEW YORK TO PARIS BY LAND

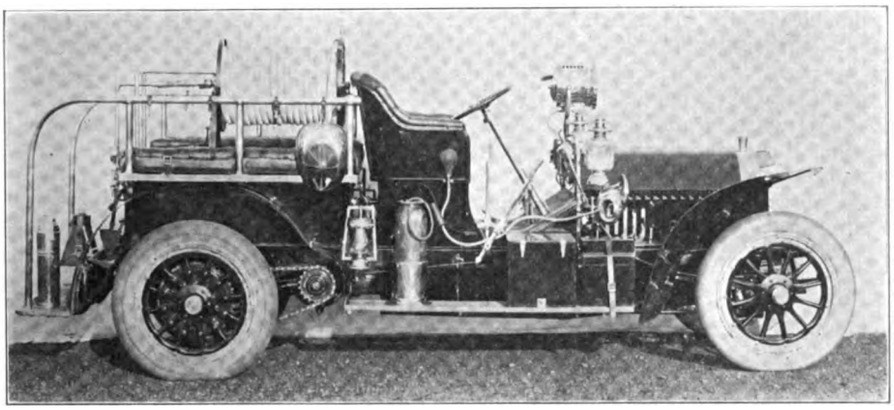
Another World Covering Endurance Contest Projected—Promoters Say Entries Already Are Coming in.

From New York to Paris by land is the project fathered by that indefatigable and utterly Parisian publication, Le Matin, for an automobile endurance contest, and already entries have been received and a great hubbub created, with enterprising representatives of numerous automobile concerns indicating the probable participation of their respective cars in the 15,000 mile contest. While it has all been settled that the cars are to line up for the start at Broadway and Forty-second street, New York, otherwise known as Times Square, and are to finish, as many of them as can, at the office of Le Matin in Paris, the minor details of the date of the start and the route to be followed are still lacking definite settlement, except that in the case of the latter it will obviously be necessary for the contestants to cross over from America to the other continent by way of Bering Strait, the waterway which divides Alaska and Siberia.

Having successfully promoted the Pekin to Paris race, however, Le Matin is confident of the success of the greater venture. The newspaper that has undertaken the American end of the excitement, after giving space to everybody who wants it known that his car is capable of doing the trick, publishes many valuable contributions on the difficulty of the trip, particularly in the Alaska district, from travelers, geologists, explorers and men of science, who variously pronounce the scheme entirely feasible, of doubtful practicability, or utterly impossible. As originally suggested the plan was to have the cars go the whole distance entirely on their own power, the crossing of Bering Strait being accomplished while the surface of that Arctic body of water was covered with thick ice, heavy enough for the machines to use it as a road, but it is probable that the rules in their final form will not impose any such requirements.

As a result of the announcement the promoting publication declares itself "inundated" with letters from would-be participants and near-starters from all over Europe and America. It will nevertheless exercise a cautious deliberation in giving out the definite conditions of the contest and perfecting the necessary arrangements.

Club Hires a Thief Catcher.



Thievery of cars must prevail larmingly in Minneapolis. To halt it the local club has engaged permanently a detective who is on hand at the club room at all times, ready at a minute's notice to trace a missing car.

BRIDGEPORT'S NEW FIRE FIGHTER

It Will Travel Fifty Miles an Hour and Combat Flames with Chemicals—Details of Its Equipment.

When Bridgeport, Conn., has a fire from now on it will know it, if by no other sign than that the new automobile chemical outfit which it has just bought will be seen tearing to every conflagration at a 50 mile an hour gait with a big bell ringing and a siren screeching. The car, which is built up on a Locomobile chassis by the Locomobile Company of America, has a 60 horsepower motor, four speed selective transmission and

BRIDGEPORT'S LOCOMOBILE CHEMICAL FIRE ENGINE

side chain drive and weighs about 4,200 pounds. Its fire fighting equipment is a 50 gallon Babcock chemical tank, hose reel and hose, small hand extinguishers, crow bars, axes, helmets and other paraphernalia ordinarily carried on a vehicle of this kind. The normal carrying capacity of the outfit, in addition to the equipment, is eight men, but when necessary ten men may be carried. Although the rig is especially designed all the way through, it is essentially practical and embodies features that Locomobile experience in the building of heavy touring cars for years has shown to be suitable for high speed and heavy service.

The theory of the Bridgeport Fire Department in ordering this fast chemical engine is that the beginning of all fires is small and that if a chemical engine can arrive early it can extinguish them with promptitude and a minimum of damage. Not only does every minute count in the success of chemical engine work, but every second, so that the new fire fighter will be driven at top speed to every alarm. The machine will be in direct charge of two attendants who have been studying the Locomobile at the factory in Bridgeport for the past two months. It will be kept primed and ready to go at the tap of the gong, and to expedite its departure without delay it has been fitted with an ingenious electrical apparatus for lighting the acetylene headlights from the seat, so that at night there will be no time lost in lighting up before getting under way, nor danger incurred attempting to light up after the start.

Stopping a Car Legally Defined.

When a motor car driver is given the signal to "stop" by the driver of a horse, the question arises as to whether he must stop his motor as well, or whether he may simply declutch and, while bringing his car to a standstill, let his motor run. In a legal battle involving damage claims against an automobilist whose machine, although brought to a stop at the roadside, frightened a team of horses with the purring of the motor, the district court in Minnesota decided that when under the State law the horse driver commanded the motorist to stop, the latter should have stopped the whole works and not the car alone. On appeal, however, the supreme court of the State reverses the lower court and indicates that when the motorist stopped his car he did all that was required of him under the law.

The litigation arose out of an accident on a country road near Austin, Minn. The owner of the car, J. Miles Maxfield, was touring when he met a team driven by Mrs. Anna Mahoney. The horses were somewhat frightened and the woman hailed Maxfield to stop. This he did, according to his understanding of the term, by running his car to the side of the road and stopping it, but his motor continued to run. Whether from the noise of the motor or the appearance of the car, the horse in being driven past, took fright and ran away, causing a bad spill. Mrs. Mahoney sued and was awarded $700 damages after the district court of Mower county had instructed the jury that when the law required an automobile to stop it meant that not only the car but the mechanism, as well, must be stopped. Maxfield appealed on error and the supreme court did not look with approval on the district court's method of expanding the State law to mean more than it said, so that the case is sent back for a new trial. Under the supreme court construction of the law, the defendant automobilist will have an easy victory.

ALL THE HONOR FOR MARYLAND

State Championship Won by Native Son Driving Maryland Car—Big Crowd at Baltimore's Meet.

Home talent triumphed at Electric Park, Baltimore, Md., Thanksgiving Day, 28th ult. A Maryland driver, piloting a Maryland made car on a Maryland track won the Maryland championship, and several thousand Marylanders yelled themselves hoarse—the fact that most of them had colds doesn't count—while the band struck up "Maryland, my Maryland." The occasion was the annual Thanksgiving meet promoted by the Maryland Motor Association.

Three cars started in the five mile championship, which turned out to be the best race on the card. Stanley Zell (Thomas) took the lead at the start and opened a wide gap when a broken spark plug left him stalled, and Gooden (Autocar) and Behrens (Maryland) were left to fight it out. Goodens kicked up the dust for the first mile. Behrens came up in the second and for two laps ran a neck and neck struggle with the other. Skilful handling on the turns, however, won the race for Behrens in the last mile, his winning margin being about four feet.

In the three miles for cars under $3,000 Howard Gill (Thomas), electrified (which wasn't difficult at Electric Park) the crowd by his running fight with Friese (Autocar). The last named took the position at the start, but after some hard driving Gill got in front only to have the pole taken away from him in the next lap. Gill finally regained his place at the head and kept it until the finish.

One event that caused considerable amusement was what was termed a "cross country run" between cars of the high-wheeled type. Edward C. Woolman and J. S. Hochheimer, both driving Holsmans, made the running, or rather Woolman did, for he left "der Kaiser" far in the rear.

The summaries:

Three mile novice, motorcycles—Won by Harry F. Fisher (Indian); second, Royal Gill (M-M); third, George J. Lewis (Indian). Time, 5:31.

Two miles for high wheeled cars—Won by Edward C. Woolman (Holsman); second, J. S. Hochheimer (Holsman). Time, 5:13⅘.

Five mile handicap, motorcycles—Won by "Chic" Thomas, 3 horsepower Indian (scratch); second, Fred Mertens, 7 horsepower Peugeot (scratch); third, Royal Gill, 3 horsepower M-M. Time, 7:34⅕.

Three miles for cars under $3,000—Won by Howard W. Gill (Thomas); second, E. H. Friese (Autocar). Time, 5:04⅗.

Five miles free-for-all championship—Won by A. W. Behrens (Maryland); second, E. H. Frieze (Autocar). Time, 8:13⅗.

Nantucket Tolerates an Automobile.

When the people of Nantucket, Mass., settle down for their winter's enjoyment of what prosperity they owe to the summer sojourners on their island they know of no means of travel other than their horse-drawn vehicles and the steamboat that plies between the island and the mainland when the ice permits. The narrow gauge track of the Nantucket Central Railroad is permitted to lie buried under the snow, and Dobbin supersedes the locomotive when the 'Sconset man wants to go to Nantucket, or the town man has business in 'Sconset.

At least such has been the case, but the automobile, against which the selectmen of the town have been making war all the past summer, and which they are determined to keep off the island roads next summer, if they can, has slipped in among the Nantucketers, over the rails, and promises to save Dobbin many a weary hike between 'Sconset and the town. It is owned by the railroad company, and differs from the road traveling automobile chiefly in the matter of its cast steel wheels, flanged to keep the vehicle on the rails. It is designed to carry both freight and passengers.

Even the anti-automobile element is inclined to regard the innovation with favor. As one man remarked, "I don't care how many automobiles come to Nantucket as long as they run them over the rails and not on the road." But there is some wonderment as to whether the selectmen's order of total exclusion does not bear on this particular automobile.

As to the last order, which closes all the principal streets of the town to automobiles and thus practically bars them from the island, a protest has been framed and signed which soon will be filed with the State highway commission. Among the signers are a number of permanent residents as well as some who make their summer home on the island.

First Across Hartford's New Bridge.

Hartford has a new $2,000,000 concrete bridge between that city and East Hartford. In fact(it is not quite completed, as the final touches are yet to be received, but it has been far enough advanced to cause considerable rivalry as to who would be the first to cross the structure, and for fear some one would get ahead of then Ralph A. Backman, city sales manager of the Pope Mfg. Co., and B. Woolley, of the Manus-Kelly Co., Hartford, got their car out early one morning last week, and loaded with photographers and reporters, decided to rush the bridge, although there were several obstructions, such as barrels of cement, piles of sand, and undriven spikes to be dodged. The trip was accomplished without accident, and they gained the distinction of being the first to cross the new bridge in a vehicle of any kind.

Court to Decide Automobile's Status.

Whether an automobile is a vehicle within the meaning of the statute is a question that will be decided by a full bench of the Supreme Court in Boston, in the case of William C. Doherty against the town of Ayer, Mass. The court will be asked to decide whether cities and towns are bound to keep their highways in a reasonably safe and convenient condition for automobiles. Doherty was awarded a verdict in the lower court for injury to his automobile, which sank ten inches and was stuck in one of the town's roads. Work was being done on the streets at the time and the accident happened at night. The town claims it is not liable to a traveler in an automobile, as the highway statute only makes it necessary to keep its highways in a safe condition for travelers with horses, teams and carriages. The plaintiff in the case held that an automobile is a vehicle within the meaning of the statute and the lower court awarded him a verdict of $200, but the town took an appeal.

Boston's Revenue from Scorchers.

Automobilists have considerably swelled Boston's coffers during the last six months. According to a statement of Police Commissioner O'Meara, the Boston police have made 737 prosecutions in the six months just ended, and the fines imposed in the lower courts have amounted to $6,715.

IF a car enters the most strenuous contests known in motor circles, to-wit, the Glidden Tour and all the Chicago Endurance Runs, and secures PERFECT SCORES, it is greatly to its credit. Breaking the World's Non-stop Record by a large margin—lowering the Boston-New York single and round trip road record—also Boston-Worcester record—satisfying customers in daily use all over the country—all add more to this car's credit.

This Is What the Premier Has Done

You may expect equally satisfactory results, if you buy one. They are even better now than they have ever been.

Three Models of touring cars for 1908 as follows:

Model 24. 24-28 H. P., four cyl., 5-passenger, $2250
Model 30. 30-35 H. P., four cyl., 5-passenger, $2600
Model 45. 45-55 H. P., six cyl., 7-passenger, $3750

The Week's Patents.

865,039. Means for Securing Soft-Tread Tires to Rims. Frank M. Hilton, John S. Hilton, and William W. Hilton, Akron, O., assignors of one-half to Harvey Musser, Akron, Ohio. Filed May 11, 1906. Serial No. 316,403.

1. A vehicle wheel provided with a rim having a confining flange at one side and a groove, or channel, at the opposite side, the outer wall of the groove, or channel, having notches at intervals, a tire slipped upon the rim and a lock-ring fitted to the grooved side of said rim and having a confining flange co-operating with the confining flange of the rim to prevent lateral displacement of the tire, said locking ring having transversely spaced portions to embrace opposite sides of the outer wall of the grooved portion of the rim, the inner spaced portions consisting of lugs adapted to pass through the notches formed in the outer walls of the grooved portion of the rim and to engage the inner, or rear side thereof.

865,060. Carburetter. Albert F. Rockwell, Bristol, Conn., assignor to The New Departure Manufacturing Company, Bristol, Conn., a Corporation of Connecticut. Filed Dec. 19, 1905. Serial No. 292,441.

1. A carburetter comprising a tank, a coil in said tank having a series of vertical phere and the other end of said coil being in communication with the outside atmosphere and the other end of said coilbeing in communication with the interior of the tank, means for permitting liquid from said tank to enter independena convolutes of the coil, and an outlet port in communication with said tank.

865,099. Engine. George Gray, Mianus, Conn., assignor to The Mianus Motor Works, Mianus, Conn. Filed March 28, 1907. Serial No. 365,127.

1. In a sparking mechanism, the combination with a fixed electrode, a spindle carrying a movable electrode, an arm on said spindle and a stop to receive said arm when in its normal position, of a vertically movable rod passing through said arm, a guide through which said rod moves, a fixed collar on the rod, a spring between said fixed collar and guide, means for engaging said rod to raise it and turn the spindle of the movable electrode to cause the latter to engage the fixed electrode and means for releasing said rod and permitting it to descend after the fixed collar thereon shall have moved above the arm on the spindle of the movable electrode.

865,101. Lubricating Means for Internal Combustion Engines. Carl O. Hedstrom, Springfield, Mass. Filed June 12, 1907. Serial No. 378,558.

1. In an oiling system of the class described, in combination, a casing, a rotary member mounted therein, a plurality of cylinders secured to the casing and having pistons therein connected to the rotary member, the rotary member having two sections or portions and located under oppositely disposed plates or webs that partially close the opening of the cylinders, whereby the lubricant which is contained in the casing may be equally distributed by the centrifugal action of the rotary member to the cylinders, said plates being also provided with diagonally disposed openings over the rotary members, as described.

865,115. Wheel. Edward D. Markham, Chicago, Ill. Filed Sept. 17, 1906. Serial No. 334,907.

1. A wheel comprising a hub, spokes secured to the hub and out of engagement with the rim, cylinders carried by the rim, pistons therein and piston rods connected to said pistons, the free ends of the spokes being loosely connected to said rods.

865,117. Rotary Engine. Ernest Muhl Philadelphia, Pa. Filed Oct. 8, 1906. Serial No. 337,855.

1. In a device of the character described, a fixed cylinder, a movable cylinder eccentric thereto, pistons operating in the movable cylinder, an inlet port, a valve, a crank arm operating said valve, a rod connected with said crank arm, and a plurality of pins operating said rod with rotation of the movable cylinder.

865,134. Rubber Tire Setter. Henry L. Stoup, Ypsilanti, Mich. Filed March 9, 1907. Serial No. 361,585.

1. A machine of the character described, comprising a shaft having right and left threaded portions, a guide parallel to said shaft, wire-engaging members respectively engaging said right and left threaded portions of said shaft, and longitudinally slidably engaging said guide, and a bifucated arm intermediate said wire engaging members and sleeved upon said shaft and guide.

865,135. Internal Combustion Motor. Benjamin L. Toquet, Westport, Conn. Filed Jan. 6, 1906. Serial No. 294,960.

1. The combination in an internal combustion motor, of a working cylinder, a chamber to supply the explosive mixture to the working cylinder, connecting means between the cylinder and the chamber, and a screen and valve means whereby the explosive mixture is directed either wholly or partly through the screen or clear of it.

865,161. Lawn Mower. William H. Coldwell, Newburgh, N. Y. Filed Feb. 20, 1907. Serial No. 358,381.

1. The combination with a lawn mower provided with a motor frame provided with a lawn rolling roller, and a separate frame forward of the said roller, carrying the cutting mechanism, and connections between said frames permitting them to move with respect to each other, of a grass receptacle, carried by said motor frame extending transversely across the machine, located adjacent to the cutting mechanism, and having a discharge aperture at one end, a feeding mechanism for feeding the cut grass in said receptacle toward said discharge aperture, and mechanism carried by the motor frame, for supporting and continuously operating said feeding mechanism, substantially as described.

865,201. Reversible Transmission Gear. Walter S. Morton, Upper Sandusky, and Moses W. Kouns, Columbus, Ohio, assignors to The Ohio Manufacturing Company, Upper Sandusky, Ohio, a Corporation of Ohio. Filed Feb. 23, 1907. Serial No. 358,795.

1. In a device of the character described, the combination, with a shaft and a plurality of gears mounted thereon and adapted to be connected one to the other, of a second shaft, a pinion mounted on said second shaft and adapted to mesh with one of said gears, a second pinion mounted on said second shaft, a flexible driving member adapted to connect said second pinion with another of said gears, and means for connecting said pinions to said shaft.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

Never Mind the WEATHER

TRIUMPH GREASE WORKS JUST THE SAME.

IT IS A PERFECT LUBRICANT WITHOUT GUM, PITCH, OR ACIDS.

IT WILL NOT FREEZE IN WINTER

IT WILL NOT MELT AND RUN NO MATTER HOW GREAT THE FRICTION

AT ALL TIMES THE BEST

BECAUSE it is a perfect lubricant.
BECAUSE is is composed entirely of materials that in themselves are pure lubricants.
BECAUSE it does not contain any gum, pitch, acid or any other non-lubricants or any material that in any way produces friction.
BECAUSE it has a heavy body that always leaves a layer of grease between the opposing surfaces of the bearings.
BECAUSE it will not melt, which will prevent the running down on the axle and destroying the rubber tires.
BECAUSE it will stand 410 degrees of heat before it melts, therefore it will not melt and run out of the compression cups or bearings in the hottest weather.
BECAUSE it will not freeze. There has never been a day so cold that it would put this grease out of business.

Owing to the fact that it never wastes and never runs out, and that its molecules are practically indestructible, it lasts in **actual work** from 50 to 100 per ceent longer than other lubricants, and is therefore **immensely cheaper.** **SEND A TRIAL ORDER TO-DAY—10-LB. TRIAL CAN $2.00.**

Remy Magnetos

which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.

We will exhibit at both New York Shows and the Chicago Show.

Wico

For a Hot, Snappy Spark, Use Wico Spark Plugs With Micrometer Adjustment

A new plug, excelling every other plug on the market. A most decided improvement, insuring rhythmic running of the engine.

The Wico is equipped with Micrometer adjustment permitting instant regulation to suit any compression or system of ignition.

The spark gap can be set to A KNOWN DISTANCE—you don't have to guess; and all plugs can be set alike down to 1-1000 of an inch.

The electrode and chamber are so constructed that the WICO PLUGS are practically SELF-CLEANING.

Develop the FULL HORSEPOWER of your engine by using the WICO PLUG.

Price $1.00. For sale everywhere.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

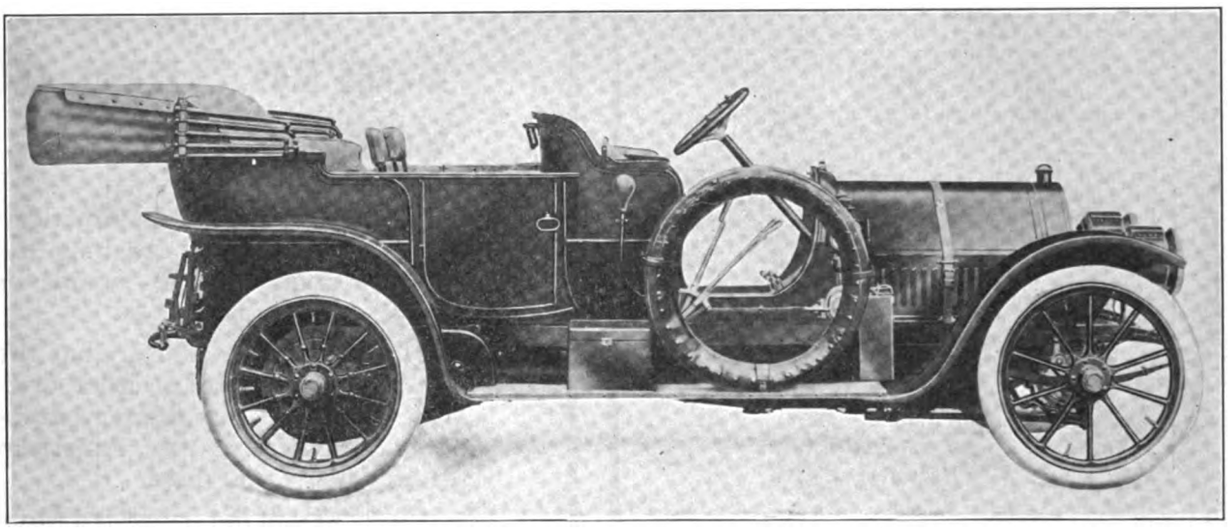
"WHITNEY" CHAINS

January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

Patented

"WHITNEY" CHAINS



November 1, 1907, to December 31, 1908, conditions as follows:

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

THE WHITNEY MFG. CO., - Hartford, Conn.

POPE-TOLEDO

One of Our 1908 Models

As to the policy of the Pope-Toledo factory for 1908, we make the following statements:

1st—Our line for 1908 as shown at the New York Show was acknowledged by dealers, users and the press to be the finest exhibited.

2d—This product is now being manufactured and in fact is largely completed ready for assembling.

3d—Deliveries are being made with our usual promptness in rotation as booked.

4th—The business is being pushed aggressively and progressively; our old agents are being protected and we want new *live ones only*, where not satisfactorily represented.

5th—Our "square deal" policy towards the user and dealer is being continued.

6th—We will make enough cars to take care of the demand.

7th—An aggressive advertising and publicity campaign is being pushed.

8th—Our new catalogue, the finest we have ever issued, is in the printer's hands.

If you want the finest line of cars made in America today, correspond with us at once

CHICAGO AUTO CLUB SELECTS IDEAL CAR

"Mitchell Auto Pronounced Ideal by Chicago Automobile Club.

"The Mitchell Motor Car enjoys the enviable distinction of being officially named by the Chicago Automobile Club as nearest to the ideal car of any standard car in existence. And this is how it happened:

"A committee of the Club drafted a set of specifications for an ideal automobile. After the specifications were completed, all standard American and foreign cars were investigated and compared, with the result that the committee reported to the Chicago Automobile Club in favor of the Mitchell motor car as the ideal car.

"These men owned and operated various makes of cars and were thoroughly familiar with many types both American and foreign. The committee's report has been printed for distribution among the members of the Chicago Automobile Club."

From the *Chicago Evening American*, December 3, 1907.

Have This Ideal Car Demonstrated Mr. Business Man

Let it **prove** itself the ideal car. Any Mitchell agent will be glad to "show you" in a road test if you're interested. Just call him on the 'phone and he'll take you out any time.

Here are the specifications of the Mitchell Ideal Line for 1908:

Model I—5-passenger, 4-Cylinder Touring Car; blue finish; 35 h. p.; speed, 50 miles; 32-in. wheels. Price, $2,000.

LIMOUSINE—4-Cylinder; blue finish; 35 h. p.; speed, 40 miles; 32-inch wheels. Price, $2,800.

MODEL G—3-Passenger, 4-Cylinder Gentlemen's Roadster; French gray finish; red upholstering and running gear; 20 h. p.; speed, 45 miles; 32-inch wheels. Price, $1,250.

MODEL H—2-Passenger, 4-Cylinder Runabout; blue finish; 20 h. p.; speed, 45 miles; 30-inch wheels. Price, $1,000.

MOTOR TRUCK—4-Cylinder; 20 h. p.; capacity, 1 ton; speed, 14 to 15 miles. Price, $2,000.

Mitchell Motor Car Co.

277 Mitchell Street, Racine, Wis.

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

Manufactured in a factory devoted exclusively to the production of pneumatic tires.

Manufactured by the Pioneer builders of Clincher Automobile Tires in America.

Years of study and experience are necessary to produce a tire that will prove satisfactory under all conditions. Our plant is devoted exclusively to the manufacture of pneumatic tires, and as pioneers in that line we have had the necessary experience, and the results of our close study in one line exclusively are shown in our 1908 tires.

Spaces 38 and 39 Coliseum, Chicago Auto Show.

Never Mind the WEATHER

TRIUMPH GREASE WORKS JUST THE SAME.

IT IS A PERFECT LUBRICANT WITHOUT GUM, PITCH, OR ACIDS.

IT WILL NOT FREEZE IN WINTER

IT WILL NOT MELT AND RUN NO MATTER HOW GREAT THE FRICTION

AT ALL TIMES THE BEST

BECAUSE it is a perfect lubricant.
BECAUSE is is composed entirely of materials that in themselves are pure lubricants.
BECAUSE it does not contain any gum, pitch, acid or any other non-lubricants or any material that in any way produces friction.
BECAUSE it has a heavy body that always leaves a layer of grease between the opposing surfaces of the bearings.
BECAUSE it will not melt, which will prevent the running down on the axle and destroying the rubber tires.
BECAUSE it will stand 410 degrees of heat before it melts, therefore it will not melt and run out of the compression cups or bearings in the hottest weather.
BECAUSE it will not freeze. There has never been a day so cold that it would put this grease out of business.

Owing to the fact that it never wastes and never runs out, and that its molecules are practically indestructible, it lasts in **actual work** from 50 to 100 per ceent longer than other lubricants, and is therefore **immensely cheaper.** **SEND A TRIAL ORDER TO-DAY—10-LB. TRIAL CAN $2.00.**

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

WRITE FOR THE NEW WHITE CATALOG

We would like to send a copy of our new catalog to everyone interested in any phase of motoring. Everyone should read, for example, the description of the White generator, thatwonderful steam-makir g device wherein the water is at the top and the steam at the bottom and wherein none of the conditions of the ordinary boiler are present. The references to the continuous success of the White in all forms of competition during the last seven years will also prove of interest. Also, we invite attention to the detailed specifications of our two models—one of 30 horse-power and the other of 20 horse-power—with touring car, runabout, limousine and landaulet bodies.

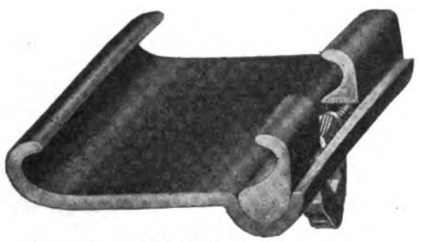
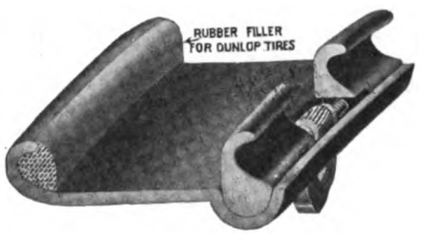
ATTENTION



Motorist, Dealer and Manufacturer

Do you know that Morgan & Wright tires have backed up all the good things we have said about them?

We do not mean by this that trouble is unknown to the users of these tires, but it does mean most emphatically that the exceptional service given by these tires has commanded the favorable attention of manufacturers, dealers and owners throughout the country.



Some manufacturers, dealers and motorists don't know this; that's because they don't specifiy Morgan & Wright tires.

Furthermore, this "favorable attention" has been converted into generous orders—already booked—for 1908 deliveries.

CLINCHER

The Improved Midgley Rim, illustrated above, accommodates every make of Clincher or Dunlop tires, as well as every type of mechanically-fastened tires, except one. Standard measurements thruout, including inside diameter. Solid bead.

Matheson

Every Matheson car turned out in the last ten years is still running and is reported to be in good condition. Most of the Mathesons turned out within the last three years have never had a single replacement and are still giving perfect service to their original purchasers. Many 1906 Mathesons have to date, been not only free from repairs but from even adjustments. We have many letters from owners of 1907 Mathesons who have given their cars hard and constant use for the last seven months without spending five cents for repairs.

The salient Matheson features are those of the greatest foreign cars. The Matheson differs from these in one important respect—it's better. The great string of Matheson victories during the past season, its new speed records, hill climbing records, endurance records, its perfect scores galore in reliability contests, made not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would direct the improvement of a single feature. Feature for feature through the world's output of high powered cars, not excepting the best of the foreign makes, there is nothing that can compare with the Matheson for performance over American roads.

Write for our new booklet, "I Drove my Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. The Matheson sets a standard by which you may judge other high powered cars.

The Purchase of An Automobile

has become a purely business transaction in which the returns in satisfactory service, reliability and economy of maintenance are balanced against the investment.

From the standpoints of economical maintenance, absolute reliability and minimum depreciation in market value, the

stands preeminently the gilt-edge investment of the industry, a position won and held through years of satisfactory service.

The 1908 models mark the nearest approach to mechanical perfection ever attained.

Our advance catalog, now ready, will show you how and why and a demonstration will convince. Both are at you service. Write today or see the nearest Rambler representative.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, December, 12, 1907. No. 11

DAIMLER CUTS OUT MIDDLEMEN

In Heralding Maja, Sister of Mercedes, This Decision is Made Known—"Stupendous," Declares Press Agent.

Fraulein Maja Jellinek no longer has cause to be envious of her sister Mercedes. Their doting father, who is high up in the Daimler Motoren Gesellschaft, now has placed them on the same level.

He has named a motor car for Maja (pronounced Mya) exactly as several years since he styled one Mercedes; but—unkind cut—he says the Maja is better in every way than the Mercedes. It is to be built wholly in the Daimler company's Austrian factory and any American possessed of the price, will be able to buy one right here in New York, where a Maja branch will be located. But agents are not wanted. The Daimler people declare they are through with middlemen of all sorts and couple the declaration with references to "graft" and "subtle practices" that scarcely will be relished by the men who previously handled the Mercedes for them.

The Maja chronicleer supplements these statements and intimations, to say nothing of a mass of superlatives, with an expression of deepest amazement that "an undertaking so stupendous could advance to a commercial actuality without a breath of the news reaching the public." Despite the "tremendousness" of the news, however, the world has continued to revolve in the same old way and the Statue of Liberty has not been rocked from its pedestal.

Shoemaker Gets an Extension.

The Shoemaker Automobile Co., for which a receiver was appointed while removal from Freeport, Ill., to Elkhart, Ind., was in progress, is in a fair way to overcome its difficulties. It is stated that the creditors have consented to a six months' extension and that the residents of Elkhart who subscribed for $36,000 worth of the stock have overcome their temerity and agreed to produce the money. Meanwhile, the company has elected the following officers: President and treasurer, C. C. Shoemaker; secretary, S. Cooper, Kansas City; foreman, Harry Shoemaker; directors, F. L. Feckler, St. Paul; F. Shire, Cincinnati; Dr. J. T. White, Dan Brubaker, C. C. Shoemaker, Freeport; S. Cooper, Kansas City.

To Make Opening for Knox Creditors.

Obstacles that prevented it having been removed formal steps toward placing the Knox Automobile Co., Springfield, Mass., in the possession of its creditors until their claims are satisfied, will be taken on Monday next, 16th inst., at a meeting of the stockholders, called for the purpose.

At that time a proposal to increase the capital stock from $500,000 to $1,000,000 will be considered, the increase being necessary in order that shares in the company may be apportioned to the creditors who accepted the assignee's offer to take stock in payment of their claims. The changes in the by-laws, necessary to give the shareholding creditors the controlling voice in affairs of the company until its debts are liquidated by retirement of the creditor's shares, also will be submitted.

Pierce in a Tire Company.

The Empire State Tire Co., which recently was incorporated and which has established a plant at 198-200 Terrace, Buffalo, N. Y., has for its vice-president George N. Pierce, of the George N. Pierce Co. The other officers are Sylvanus B. Nye, president, and William F. McClurg, secretary-treasurer. The factory superintendent is Lemon Greenwald, under whose patents the company will operate in producing what is styled the extensible tread pneumatic tire, a non-skid tread and an armored non-puncturable protector, which is designed to be placed between the shoe and the inner tube. In addition, the company will make a feature of installing in garages or repair shops complete tire repair apparatus, including vulcanizers, etc.

RECEIVERS FOR ELECTRIC VEHICLE

Their Appointment Follows Failure to Renew Bonds and Friendly Action—Liabilities Exceed $3,600,000.

On Tuesday last, 10th inst., the Electric Vehicle Co., which has its plant in Hartford, Conn., and which is a New Jersey corporation capitalized at $20,000,000, was placed in the hands of Hasley M. Barrett, of Bloomfield, N. J., and Henry W. Nuckels, of Hartford, as receivers, by Judge Joseph Cross of the United States Circuit Court at his home at Elizabeth, N. J. Mr. Nuckels is the secretary and treasurer of the company. The bond of each receiver was fixed at $200,000. The application for the appointment of receivers was made by the Hartford Rubber Works Co., which has a claim of $11,785 against the Electric Vehicle Co., and was in the nature of a friendly proceeding designed to protect the general creditors. Later, Mr. Barrett and W. S. Montgomery were named as auxiliary receivers for the company's New York property.

On the day following Messrs. Barrett and Nuckels appeared before Judge Wheeler in Chambers at Hartford, Conn. At the close of the hearing they were appointed receivers for the Connecticut properties of the company, their bonds being fixed at $200,000.

The immediate cause of the company's failure was the financial stringency which made it impossible to borrow money for current expenses and to meet or renew the $2,500,000 mortgage bonds which matured on November 1st last.

Apart from the $2,500,000 bonds which are secured by a mortgage on the property of the company held by the Morton Trust Co. of New York, as trustee, the liabilities comprise demand promissory notes to the amount of $591,043.32, a note for $300,000 which fell due on December 3 last, a note for $2,600 due December 25 next, and a note

Digitized by Google

for $5,708.18 due January 15 next, accounts payable aggregating $204,790.32 of which $150,000 has been due and unpaid since November 15. The total is $3,604,141.82, of which $2,016,000 is past due. The assets are listed as follows:

Plant, land, buildings, machinery, appliances, book value	$717,498.16
Office furniture	4,731.54
Finished vehicles	173,087.73
Consigned vehicles and merchandise, book value	90,387.51
Raw materials, supplies and parts	770,474.20
Finished parts	378,714.00
Stocks and bonds of other corporations, book value	358,002.00
Patents and patent licenses, book value	11,447,537.28
Accounts and notes receivable	132,000.00
Cash	12,000.00
Total	$14,084,432.42

In addition the schedule mentions as an asset the item of "good will," and alleges that under this head the trademark of "Columbia" is of great value. The company is the sole owner of the noted "Selden" patent, which is used by the Association of Licensed Automobile Manufacturers, and from which a large amount in royalties is derived.

According to the 1907 edition of "Moody's Manual" the Electric Vehicle Co. was incorporated in the State of New Jersey on September 27, 1897, to manufacture automobiles, and subsequently acquired the interest of other concerns in similar lines, including the New Haven Carriage Co., the Siemens-Halske Electric Co. of Chicago, the Motor Vehicle Co. of Elizabeth, N. J., and the Columbia Automobile Co. of this city. The company's product has been distributed through various subsidiary companies, including the New York Electric Vehicle Transportation Co., the Pennsylvania Electric Vehicle Co., the Illinois Electric Vehicle Transportation Co., the New England Electric Vehicle Transportation Co., and the New Jersey Electric Vehicle Transportation Co.

The authorized capital stock of the company at first was $10,000,000. This was successively increased to $12,000,000, to $18,000,000, and then to $2,000,000. Of this $9,000,000 is 8 per cent. cumulative preferred, par $100. There is outstanding $10,450,000 common and $8,145,000 preferred. Dividends were paid regularly on the preferred stock quarterly at the full rate from April, 1899, to April, 1900, and on the common 8 per cent. was paid in 1899 and none since. The Electric Storage Battery Co. of Philadelphia owns $3,152,000 of preferred stock, $3,212,300 of common, and $540,000 in bonds. The bonded debt of the company is given in the "Manual" as $1,774,000, refunding first 6s, extended in 1905 and due on November 1, 1907.

The Columbia Motor Vehicle Co. of Boston is a subsidiary company of the Electric Vehicle Co., and the Electric Vehicle Co. of 1332 Michigan avenue, Chicago, and the Electric Vehicle Co. of 134 West Thirty-ninth street, New York, are branch offices of the Hartford company.

During recent months there have been several changes in the Board of Directors of the company. H. H. Vreeland retired as a director some months ago, and M. J. Budlong, who was president, resigned that office and was succeeded by Walter G. Henderson, of the Electric Storage Battery Co. Grant B. Schley, Jr., was another director who resigned recently. Among the other directors are M. Gavin, a son-in-law of James J. Hill, and who is associated with Moore & Schley; W. O. Knudson, and Albert Taylor.

The appointment of receivers for the Electric Vehicle Co. will cause no surprise to those conversant with the condition of affairs in that company. It has been generally known that the mortgage bonds covering the plant of the company at Hartford, Conn., the plant of the New Haven Carriage Co., at New Haven, Conn., and stock in various subsidiary companies both had affected and restricted their merchandise credit to no little extent. Furthermore the bonds of the company when issued were underwritten at 90 and were largely controlled by interests identified with the Metropolitan Street Railway Co., of New York, and the Electric Storage Battery Co., of Philadelphia.

The trade has recognized the fact that the Electric Vehicle Co. could have been continued as a "going concern" if their bonds could have been renewed, as their income from the Selden Patent alone—which is 3/8 of 1¼ per cent. of the price of all the vehicles sold by members of the Licensed Association of Automobile Manufacturers—netted annually for the past three years an average exceeding $200,000, which would have been more than sufficient to take care of the interest charges on their bonded indebtedness. However, with financial conditions which have prevailed in New York for the past three months it was anticipated that the company would have difficulty in renewing their bonds. It is reported from authentic sources that while their bond issue amounts to $1,521,000, the balance has been pledged as collateral for money advanced on the company's paper.

In a statement issued immediately after their appointment, the receivers say:

"Plans are already being considered for the rehabilitation of the company and it is confidently expected that within a comparatively short time creditors' claims will be met and the company be put in a position to continue its business with new capital. The courts of New Jersey, New York and Connecticut have all authorized the receivers to conduct the business of the company and it is proposed by the receivers to so continue to conduct it without interruption, except that it will be necessary to close the factory for a few days (probably the rest of the week) beginning Wednesday, to take an inventory in accordance with the order of the superior court.

"One of the most valuable assets of the company will doubtless prove to be its rights under the Selden patent, and it is the intention of the receivers to see that those rights are fully protected in every way so that the Selden situation will continue with practically the same status as existed before the appointment of receivers." The association of Licensed Automobile Manufacturers will not be affected in any way whatsoever by the complications.

BUSINESS DIFFICULTIES.

Albert L. Pope and George W. Yule, receivers for the Pope Motor Car Co. have applied for the appointment of a receiver for the R. H. Magoon Motor Car Co. Cleveland, Ohio. They allege that R. H. Magoon, doing business as the Magoon Motor Car Co., owes the Pope company $3.517.92, and that Magoon has transferred his property to his wife, to place it beyond the reach of creditors. Mrs. Magoon is made a party to the suit.

Schedules filed by the Back Bay Automobile Co., of 171 Huntington avenue, Boston, Mass., which was petitioned into bankruptcy August 15, disclose liabilities $39,344 and assets $11,635. Almost all the claims are small. There is one promissory note of $1,000, and a promissory note and money loaned amounting to $1,415. Claims amounting to $12,000 are secured by a chattel mortgage and company stock.

A petition in voluntary bankruptcy has been filed by the Atkinson Automobile Garage Co., Lockport, N. Y. The schedule shows liabilities amounting to $2,066 47 and assets consisting of stock in trade valued by the petitioners at $3,909.25.

Schedules in bankruptcy filed by the Duplex Ignition Co., New York, disclose liabilities of $8,387 and assets of $3,131. The latter consist of accounts, $1,531; stock, $600, and a patent which is pending and which is valued at $1,000.

Huntington in Hands of Receiver.

On the petition of the Bank of Huntington, whose claim amounts to $3,000, and the Harburg Tire Company, with a claim of $14.000, Clifford M. Tappen has been appointed receiver for the Huntington Automobile Co., Huntington, N. Y.. It is alleged in the petition that the mismanagement of the company's former president is responsible for its difficulties. The company built several cars which were so closely patterned after the Mercedes that even that name was preyed upon by the use of the inapt dsignation "Merciless."

Elkhart Testing a New Buggy.

The Elkhart Carriage and Harness Co., Elkhart, Ind., is making ready to place a motor buggy on the market; a vehicle of the sort is now under test.

Newark, N. J.—National Auto Transit Co., under New Jersey laws, with $25,000 capital; to conduct automobile livery. Corporators—W. S. Muchmore, Newark; W. W. Lochnberg; L. H. Abbey, East Orange,

New York City, N. Y.—Keeton Motor Co., under New York laws, with $10,000 capital. Corporators, John H. Kellock and Frank P. Reilly, 60 Wall street; Babel Goudchaux, 218 West 112th street, New York City, N. Y.

Wilmington, Del.—Dragon Motor Co., under Delaware laws, with $1,000,000 capital; to manufacture motor vehicles of all kinds. Corporators—John C. Calhoun, John Kane Mills, A. L. Kull, R. G. Kelsey and C. A. Pickard.

New York City, N. Y.—Acme Tire Chain Co., under New York laws; with $25,000 capital. Corporators—Alois B. Saliger and William Kerrigan, 514 Pearl street, New York City, N. Y.; Bernard Peritz, 457 Fifty-eighth street, Brooklyn, N. Y., directors.

Gardner, Mass.—Gardner Motor Car Co., under Maine laws, with $25,000. to conduct a garage and repair business, and sell, let and buy automobiles. Corporators—Chas. Conielli, Boston, Mass.; William C. Wiggin, Percy G. Simpson, Henry A. Perkins, and Joseph P. Carney, Gardner, Mass.

New York City, N. Y.—Rosenfeld Machine Co., The, under New York laws, with $50,000 capital, to manufacture motors, dynamos and other machinery. Corporators—A. J. Beedenbender, Flushing, N. Y.; M. Rosenfeld, Van Nest, N. J.; A. C. Someracki, Nutley, N. J.; W. C. Zimmer, New York City, N. Y.

Peorians Buy St. Louis Property.

Under an order from E. S. Robinson, referee in bankruptcy, the machinery in the plant of the St. Louis Motor Car Co. at Peoria, Ill, and its unfinished product has been sold to Harry G. Finkelstein and Warren Kinsey, of Peoria, for the sum of $10,800. The new purchasers will enter into immediate possession and will conduct the factory until such a time as it can be profitably disposed of. With the plant and the machinery there are eight unfinished cars and thirty engines.

Recently the Jesse Frenches, who had been conducting the establishment, withdrew their claims of $60,000 against the company and it is expected that a dividend of 25 per cent. will be declared. There was a bid of $12,000 for the machinery and unfinished product presented by a Chicago concern, but later they failed to make good and the bid of Finkelstein and Kinsey was subsequently accepted. The building is still owned by Jesse French, Sr., and only the machinery with the material on hand is disposed of in this sale.

Stockholders Can't Escape Assessment.

The affairs of the bankrupt and long defunct Remington Automobile Co., of Utica, N. Y., continue to cause considerable litigation in the courts through the resistance of some of the stockholders against paying the assessments demanded by the trustee in bankruptcy. In the case of Henry R. Carpenter against Lotus N. Southworth, the trustee, where the action was brought to recover the amount of an assessment which it is now claimed the trustee demanded illegally of Carpenter, Judge Ray, at Utica, sustained the demurrer of the trustee which pointed out that Carpenter's complaint did not establish any adequate reason why he should not be compelled to pay the assessment exacted of him. The Remington affairs have been in the courts for many years. The stockholders have fought every effort to make them disgorge, but this last decision seems a knockout blow.

Rivalry in "Rubberneck" Trade.

A split in the "rubberneck wagon" business of Denver, Col., has resulted in the formation of the Viewing Denver Auto Rental Co. to go into competition with the Seeing Denver Automobile Co. The organizers of the new company, all of whom were formerly connected with the old company, are George Stevenson, psesident; W. G. Cole, secretary and treasurer; H. T. Kessler, general passenger agent; and J. R. Howe and L. R. Slater.

Franklin to Bring Out a New Brougham.

In addition to the town car which it already is producing, the H. H. Franklin Mfg. Co. has under way one of the brougham type, with the steering wheel and control enclosed in the body of the car. It will be of 16 horsepower, will have a wheel base of 92 inches, and will tip the scales at about 1,700 pounds. It will be listed at $2,300.

Offer for Pope's Syracuse Property.

E. C. Stearns & Co., who, under lease from the Pope Mfg. Co., for several years have occupied a factory building in Syracuse, N. Y., have made an offer of $25,000 for the property. The Pope receivers have recommended its acceptance and applied to the courts for authority to make the sale.

Judgment Against Trident Tire Co.

Judgement for $1,890 in favor of the Standard Welding Co., Cleveland, has been entered in the New York courts against the Trident Tire Co. The latter concern started with something of a rush about a year since but for the past few months has been at a complete standstill.

IN THE RETAIL WORLD.

George J. Dunham, 182 Columbus avenue, has taken the Boston agency for Corbin cars. The local store of the Corbin Motor Vehicle Corporation has been discontinued.

The Panhard & Levassor Co., has established a branch in Boston, with George T. Gould as manager. The salesrooms are at 901 Boylston street, lately occupied by the Shawmut company.

The Santa Rosa Cycle Co., will shortly build a large fireproof garage and salesrooms at Santa Rosa, Cal., and change its name to the Santa Rosa Garage Co. This as a result of taking the agency for the White.

E. Whipple has purchased the interests of C. S. Matthews in the Matthews Auto Supply Co., 514-516 Jackson avenue, Topeka, Kan. As a result of the purchase the concern will change its name to the Cowdrey-Whipple Auto & Supply Co., J. R. Cowdrey being the other member of the firm.

George H. Phelps, formerly agent for Corbin cars in Worcester county, and E. L. Sanford, formerly manager of the Harrington Auto Station at Worcester, Mass., have purchased that concern and after making extensive alterations, will occupy its garage. The new business will be incorporated as the Harrington Garage Co.

The Gardner Motor Car Co., which has incorporated under Maine laws, with $25,000 capital, will establish a garage in the old St. Paul church building at Gardner, Mass., which is being remodeled for the purpose. Charles Coninelli, of Boston, William C. Wiggin, Percy G. Simpson, Henry A. Perkins and Joseph P. Carney, of Gardner, are named as the corporators.

Dealers Get Together Again.

The National Retail Dealers' Association, the existence of which had been forgotten by practically every one who had ever heard of it, held a meeting during the Chicago show and reorganized itself with C. F. Jensen, of Joliet, Ill., as president; R. Hokanson, Madison, Wis., vice-president; J. A. Crum, Oshkosh, Wis., secretary, and L. Ohnhaus. of Fort Wayne, Ind., treasurer. As stated by President Jensen, the object of the association is "to prevent the sale of automobiles by agencies which are subsequently not in a position to take care of their customers through want of proper equipment or through lack of practical knowledge." Firms of the "fly-by-night" order are also to be fought.

Newark Plans a February Show.

By co-operating with the local club, the Automobile Trade Association of Newark, N. J., has arranged for an automobile show to be held during the latter part of February. Plans for an elaborate affair are being made. It is estimated that there will be at least 40 exhibitors.

NEW YORK, DECEMBER 12, 1907

One of the Extravagances.

After the readjustment of affairs that is now in progress in the industry shall have been completed, it probably will be discovered that not a few men connected with automobile factories who had been accustomed to going about in motor cars, will have returned to street car travel.

For to say the least, it simply has been amazing not merely how many officials, but how many department heads and superintendents and first and second assistant superintendants of some factories have enjoyed the free and unlimited use of cars from one year's end to the other, and not infrequently of the services of a factory employee in the capacity of driver. In some instances it is a conservative estimate that from $25,000 to $50,000 has been represented by property usage of the sort.

Of course, there are sound reasons why some of these men should make frequent use of cars, but the wonder is why some of the men in comparatively modest positions have been permitted to possess them as if they were their very own, for their own pleasure and the pleasure of their families and friends.

In stopping the leaks and reducing the extravagances that have existed, it is certain that this feature of the business must receive attention.

Serviceability of the Wind Shield.

Considering the comparatively short time which has elapsed since they first came into use and the very obvious dangers attendant upon accidental fractures, it is somewhat surprising to observe how rapidly and completely the glass wind shield has gained its hold upon the public. At the same time, considering also the comparative simplicity of the idea, it is not a little surprising to note the amount of variety both in design and execution which has been achieved.

When first placed on view at Madison Square Garden several years ago, the two or three screens then in existence were looked upon with mingled scorn and distrust. In the first place the average driver of the day felt secure enough in his goggles and was certain that no great benefit could be derived from the use of a shelter to any portion of his anatomy except his eyes. Besides, there was the danger from flying glass, and it seemed almost certain that the glass would shatter whenever the car was badly jolted, let alone wrecked.

At the present time hardly a car of any pretentions is made but has its wind shield. In most cases, to be sure, it is still a plain fence, constructed without regard to the laws of displacement, but there are numerous and very encouraging exceptions to the rule, in which some attempt is made to deflect the air upward with the least possible resistance to motion, thus at once reducing the windage load upon the motor, and also removing the obstructing screen from the direct path of the chauffeur's vision. In at least one instance recently observed, the upper leaf of the folding protection was made in double form, one section being of glass and the other of very fine brass wire gauze, the two being interchangeable. The use of the gauze in cutting down the wind as well as in excluding dust to a certain extent, without at the same time presenting any possible surface for reflection or refraction of light, constitutes an evident advantage, and one sufficiently great to have inspired the equipment of an entire screen in this way in one or two other cases.

With the present popularity of the overpowered car, there is little likelihood that the additional work required to propel a machine against a head wind when carrying from three to five square feet of otherwise useless dead flat surface at its fore end will be considered of material significance. With cars of lower power proportionately, however, the effect is of more consequence, and it is not at all unlikely that in this way the design of devices which, while offering as good protection to the driver, yet present less resistance to motion, may ultimately come into popular use. Certainly there is no longer a question as to the desirability of such an arrangement, nor any doubt as to the utility and general serviceability of glass for the purpose.

Garage Success and Failure.

While many things contribute to the success or failure of garage keeping, undoubtedly the chief factor for better or worse is the treatment accorded patrons. The care and repair of motor cars involves so many possible causes of friction between the two parties to the contract that more tact and diplomacy is required than generally is considered to be the case.

In too many instances, if they possess the necessary tact, the garage keeper or his manager affect a degree of aloofness. They confine themselves too much to their offices. They do not seek really to become acquainted with their patrons or to earn their good will. They leave too much to the men in overalls, to whom the "cultivation" of customers is a thing apart. The man in overalls may be perfectly able to understand the language and temperament of chauffeurs, but when he is required to deal with the latter's employers, particularly when a difficulty of any sort has arisen, he is unequal to the task and too often serves only to make matters worse. On the other hand, the man in overalls who is permitted too much sway in this respect can constitute a leak which will carry away no small profit in the course of a season. He is a wise garageman who knows when not to charge for tightening a nut or a bolt, but the employee who is working for his own pocket, i. e., for tips, deserves a watchful eye.

Next to discourteous or indifferent treat-

Digitized by Google

civilization reaches. Contests rapidly are losing their value as trade stimulants. Reputations no longer are made in an hour. Most of them already have been established and now it well may be doubted if victory in the greatest contest that may be promoted will profit the makers of the victorious car to the extent of a dozen sales that might not have been made without the expense of such victory. It is only the new or unknown car which now can profit much from success of the sort. There are a number of the importers and a few of the domestic makers who still harbor delusions on the subject and who fancy that a big race greatly will assist the sale of their goods, but they are due for an awakening. From the manufacturer's standpoint, automobiling as a sport has seen its best day. It has proved its usefulness, and its returns now must be limited in its scope. But without racing and the other elements of sport, the industry and its product probably would be five years behind what it is to-day, Horseless Ages to the contrary notwithstanding.

As they run on wheels and are capable of speed, there probably always will exist automobile sport in some form, but it will be sport for sport's sake, and not for the benefit of business. Some of the manufacturers may engage in it—most of them are possessed of red blood—and if they do so, it certainly will not injure their interests even if it fails to do them any great good.

The Short Cut to Peace.

It really seems about time that Mr. W. J. Morgan and the American Automobile Association "got together." Friends of both sides should seek to bridge the wide chasm. For many dreary weeks, Mr. Morgan, who has a New York evening newspaper at some portion of his back, that is, when he is not promoting sandfests in Florida or mountain climbs in New Hampshire, has been uppercutting the A. A. A. until it should be, even if it is not, dizzy. He has been tearing the presidential policies to tatters, hammering hard at the treasury and pin-pricking the Racing Board in a manner truly awful.

It all seems very foolish when the way to prevent it is so clear and so simple, and when the way to place the A. A. A. far, far above criticism and reproach is equally plain. Why do not the officials of the A. A. A. resign or otherwise "chase themselves"? With the field unobstructed, it then would be possible to make up a ticket that would spell satisfaction, not only from top to bottom, but crosswise as well, as follows:

For President.
W. J. Morgan.
For Secretary.
Will J. Morgan.
For Treasurer.
William J. Morgan.

After election, President Morgan very readily could appoint Private Morgan chairman of the Racing Board, and of the other important committees, and the four or five ply chairman should be left free to select his fellow committeemen. In this way, there would be left no room for dissent or dispute. Everything would be perfectly lovely.

Mr. Morgan is a man of travel and experience which encompasses the better part of two hemispheres and though he does not plaster his hair on both sides of his forehead, he has every other necessary qualification. Seriously speaking, he is far-seeing enough to discern that the greatest lasting strength of an organization lies in individual membership and as secretary he could guide the A. A. A. in that direction; as treasurer, he could see to it that no guilty dollar escapes, while as President he certainly could talk as much about "freeing slaves" as President Hotchkiss has talked and do as little toward freeing them. But in his capacity as chairman of the Racing Board he could fairly scintillate True, he partly overlook those "two best bets," the Metropolitan Automobile Association and the "Automobile Manufacturers' Committee" and selected a New York club to run his hotel's speed carnival in far off Florida, but that is merely an incident Generally speaking, he knows all the ins and outs of every phase of the racing game. He's been there before many a time and oft. He is a professional, but that is his misfortune. For he became one merely because he raced for cash and against other professionals, which the A. A. A. with assinine graciousness says a man may do and yet remain an amateur—under its rules. Morgan's misfortune was in being born too soon. He probably would find it a horrible job in distinguishing an A. A. A. amateur from an A. A. A. professional, but he certainly could do so as acceptably as is now done by Jefferson DeMont Thompson or W. K. Vanderbilt, Jr., and as it is, he has done his best by including in the program of the Florida sandfest an event for "gentleman amateurs," which term, as nearly as can be made out, is the equivalent of "professional gentlemen," which is in the nature of offsetting the A. A. A. shamateur and adding to Morgan's qualifications for A. A. A. office. Be that as it may, let us have peace —and Morgan.

To Reach the Highest Plane.

One of the most significant points developed in connection with the report of the Watson experiments, recorded in another column, is contained in the final conclusion in which the investigator observes "that the question as to what kind of spark is best, involves not only the position of the sparking plug, but also the peculiarities of the carburetter and method adopted to throttle the engine." This emphasizes the relationship between cylinder and carburetter design—as, in fact, between all portions of the motor—and shows the difficulty of segregating them. Not until each function of the motor may be isolated from all others and studied absolutely alone, can it be hoped to reach the highest plane of development in gas engineering.

As showing how true this is it is sufficient to indicate that the results of carburetter experiments, hitherto supposed to have been relatively absolute in their nature, must have been affected to a greater or less degree by the relative efficiency of the ignition system employed. Two motors put through the same test develop different results, simply because one may have its ignitors located in a pocket at one side of the combustion chamber while the other mounts them in the center of the cylinder heads. Yet in testing for the best position of the ignitors, on the other hand, the results are more or less complicated by the uncertainty of the carburation. Similarly, experiments with methods of control, lubrication, balance, and all other of the more vital points of construction, are subject to embarrassment through lack of proper standardization of conditions.

Of necessity, the development of the internal combustion motor has proceeded by a process of counter-checking and interdependent correction first of errors in one quarter, and then of those in another. The time has passed when this condition is absolutely requisite, however. It now is possible to create conditions in nearly every part of the motor which, if not absolutely standard, are at least sufficiently constant to steady the results of investigations in other lines.

CORRESPONDENCE

Owen's Opinion of the Chicago Run.

Editor of The Motor World:

It is very evident to me, after looking over your account of the reliability run in Chicago, that whoever reported this did not take the trouble to look into matters as they should, or had some favorite to play. I have been in a great many so-called reliability runs, and I consider this one the most fair to all concerned, that it has ever been my pleasure or misfortune, whichever you may consider it, to be in.

I notice several statements made by your reporter which are absolutely wrong. In one he says the lacing was chafed, when he should have taken the trouble to find out that the lacing was broken. Now if a broken lacing on a leather boot that covers some important part of the machinery comes off, it is not only a nasty job, but is sometimes a very important one to attend to, and it is one that most owners of a car would not care to do while on the road. It is, therefore, a good lesson to the manufacturer of a car, and should be a means of providing some other kind of lacing than a shoestring. If a red light falls out of a lamp it is liable to cause the arrest of the operator of the car, and should teach the lamp maker, through the criticisms of the purchaser of the lamps, to make his lamps more secure.

You make a statement that the Oldsmobile had a loose bolt on the drive shaft, inflicting six points This your reporter could have found out, was not so, had he taken the trouble to ask a question of the gentlemanly committee. The real facts are, there was a loose band that holds the leather boot on the universal, which does not mean much in itself, but, as in the case of a broken shoestring, it is a mean thing to get at on the road, and as regards the hair-splitting, and things of that kind, I consider that the committee did their absolute duty, as laid down by the rules accepted by the entrants of cars, and as far as there being nine dissatisfied survivors, and myself being one of the survivors, I beg to differ with you, and will also make a statement which I think can be very easily verified, that there is possibly not more than one or two dissatisfied survivors, a fact which your reporter might have found out, had he made an inquiry.

I have talked with most of the contestants, and the majority are more than satisfied with the results. The car that did not make a perfect running score could not have had a very competent driver, as the running schedule was very easy, and there was no occasion to drive any car fast enough to smash things up generally. The man who won this contest deserved all he got, because he followed the rules, and knew the penalties of loose parts and broken ones. He saw to it that all parts were tightened on his car, and he drove it as a car should be driven.

The only criticism that I would make for a run of this kind, would be that the committee should select the cars for a contest of this kind, and pick them up in any town or salesroom, shipping them to the point of starting, and the maintenance to replace cars so taken by new ones. When a dealer receives an automobile from a manufacturer, it is supposed to be ready to deliver to the customer, and if it is necessary to spend three or four days or as many weeks tightening up bolts, nuts, lamps, horns, speedometers, and other equipment, it is very evident that the car is not in condition to sell when received by the dealer, and to get a good, fair and square deal all around, the car should not be allowed to have experts spend three or four days on them before entering the contest. The rules of the Chicago Motor Club did not prohibit a car being prepared for the contest, and the ones that prepared their cars are the ones that made a showing.

I trust you will pardon this lengthy letter, criticizing your article, but I am stating the facts as they appear to me, and as I am quite sure they appeal to a great many dealers as well as manufacturers.

RALPH R. OWEN,
Cleveland, Ohio.

Jeffery Justifies His Position.

Editor of The Motor World:

In view of our having protested the decision of the technical committee making the awards in the recent 600 mile sealed bonnet reliability run of the Chicago Motor Club, we feel it only fair to state our reasons for such protest.

This run was undoubtedly the most severe official test of motor vehicles ever made, and in the words of one of the judges every effort was made to avoid perfect scores. In fact, these efforts were carried far beyond essential features, and though several cars made every control on time and finshed in apparently perfect condition with all seals intact, they were deprived of a final perfect score merely on account of inessentials or accessories.

In our own case the heaviest penalty, four points, was inflicted on account of a tail light, palpably broken by impact and in all probability by another car while the contesting cars were being moved in or out of the official garage, as neither the observer or the passenger in the rumble seat was aware of its being done, as they undoubtedly would have been had the damage been done while the car was in service.

Under the circumstances we felt it unfair to attach a stigma to our car on account of damage to an unimportant accessory from outside forces over which we had no control and in which no weakness on the part of the car or accessory was even contributory.

We also protested the decision covering our primary or pedal brake.

In our judgment, based on several years' experience in automobile manufacture, it is inadvisable to so adjust this brake that by sudden or injudicious application the wheels may be locked and great and unnecessary damage be done the tires. This brake is, however, in its present condition and adjustment sufficiently effective to stop the car within 50 feet with the car traveling at 20 miles per hour, at the instant of application, as was proven by several tests on various pavements. In fact, the judges admitted that the question was merely one of adjustment and based the penalty of two points on the fact that but one minute or less would be required to adjust the brake to meet the requirements.

Should instant stop be required in case of emergency, so great that effect on tires is of no consideration, a second brake is provided that will instantly lock the wheels at any reasonable speed.

We felt that as no notice to the contrary had been given the matter of brake adjustment was within our discretion and protested the penalty, but the referee held to the contrary and sustained the decision of the judges.

We deeply regret the conditions that impelled us to enter protest against the judgment of the committee and offer this statement only in order to acquaint the public with our position.

THOMAS B. JEFFERY & CO.,
Thos. B. Jeffery.

Haynes Tells of Pioneer Work.

Editor of The Motor World:

I notice in your issue of December 7 a statement to the effect that the first car built in Kokomo was designed and constructed by the Apperson Bros. at the Riverside Mch. Works, the writer merely furnishing the necessary money for doing the work. This article claims that the writer first obtained his idea of a horseless carriage when he visited the World's Fair in Chicago, in 1893, having seen a Sturgis electrical machine; it is true that the writer attended the Chicago World's Fair at that time, but I did not see the Sturgis machine or any other horseless carriage. The first carriage I saw of this description was built according to my own designs at the Riverside Mch. Works, of Kokomo, Ind. I was led to consider the matter quite seriously by my experience in the natural gas fields of Indiana, where I was obliged to take almost daily long drives through the country.

When at Portland, Ind., 1889, I first considered the construction of a steam machine, but did not give the matter very serious consideration. Soon after moving to Greentown, Ind., in 1890, I wrote to the Scientific American and asked them what form of power they would consider best for driving a horseless carriage; they replied that steam was the best power to use.

Digitized by Google

I wrote to the Chloride Accumulator Co., of Philadelphia, about the same time or a little later, asking them what was the lightest possible weight of storage battery which they could produce which would be capable of giving 1 horsepower continuously for ten hours, or 2½ horsepower continuously for four hours; their reply was that a battery of this capacity would weigh 1,280 pounds. I realized at once that electricity would be entirely impracticable for the desired purpose. Soon after this I wrote to a number of gasolene engine builders, but found that the engines produced were nearly all entirely unsuitable for the purpose. Finally I wrote to the Sintz Gasolene Engine Co., of Grand Rapids, Mich., and later purchased one of their motors. I did not purchase the engine, however, until after moving to Kokomo, as there was no machine shop in Greentown and the work could not be performed there.

Soon after moving to Kokomo, I made some preliminary experiments on road traction in order to determine what power would be necessary to drive a carriage of a given weight. I decided that something on the order of bicycle construction, but much heavier, would afford the best results so far as road traction and low power requirements were concerned; I therefore had a man mount a bicycle and place his feet on the coasters. The bicycle was then attached to the rear of a light buckboard by means of a cord and spring scales, and a man was seated on the rear of the buckboard who was provided with paper and pencil; he recorded as rapidly as possible the draw bar pull shown by the spring scale. It was found that after the horse carriage got fairly under way, going at the rate of about ten miles per hour, the pull on the scale was measurably constant. The road over which the test was made was nearly level and quite smooth. After going a certain distance the buckboard was turned around and driven back over the same course and the record repeated. These figures were then added together and divided by the number of records, which of course gave the average pull approximately required to draw the bicycle, which with its rider, weighed 210 pounds. From the data secured in the above manner, I was able to determine approximately at least, what power would be required at the wheel rims to drive a machine weighing say 500 pounds.

Soon after making this test in 1893, the gas engine arrived from the Sintz Engine Co., and I made a number of brake tests on this motor, which was of the upright, two cycle type, rated at 1 horsepower. I soon discovered that the vibration of the motor was very great, and decided therefore to make the machine considerably heavier than first intended. From this little motor I was able to get about nine pounds torque at the rim of a 12-inch fly wheel. With this data I was able to gear the motor in such a manner that it could produce the necessary torque at the wheel rims to drive the car over a level road at its best speed, and to climb very slight inclines on the lower gear. I accordingly designed the sprocket ratio in accordance with the requirements, and I remember distinctly that I was obliged to make use of some trigonometrical calculations in determining the pitch lines of these wheels The patterns were made in the north end of the city from these drawings, and the castings were afterward made from these patterns by the Pittsburg Steel Casting Co., of Pittsburg, Pa. I remember very distinctly that I asked the Casting company to run the carbon sufficiently high in the steel to admit of hardening the teeth of these sprockets.

The locality in which these tests were made is comparatively level, and except in certain rare instances it is unnecessary to have very large reduction of gear for climbing our grades. After completing the calculations for the car, I inquired carefully in regard to the best machine shop in the city for doing the work, and was advised to have it done at the Apperson shop, since the work could there be done under closed doors. I accordingly made known my plans to Mr. Elmer Apperson, and he consented to undertake the work of building the car. As I remember it, some slight modifications were made in the original plan from time to time as the work progressed, but in the main everything was carried out as originally intended. So far as the specific design of the car is concerned, I do not claim any particular merit for it, and so far as the workmanship on it went, it was about of the usual character generally done in any good shop. Several different workmen took part in the construction of the car, but as I remember it the car was entirely completed before Mr. Maxwell was employed at the Riverside works; this gentleman came later, however, and was of material assistance to the writer and Mr. Apperson in designing and building future cars.

After the car was completed at the machine works or at any rate ready for road trial, it was taken to the country and started, as not a man having anything to do with it had ever even seen anything of the kind before. The car was started on a good pike about three or four miles from Kokomo, and ran about 1½ miles further out from the city, when it was purposely stopped, turned around, and headed for home. As the writer remembers it, the car ran all the way in without a single stop, except that in crossing the gutter just before reaching the machine shop it was unable to pull up over the curbing and the motor ceased running. The car made a speed of about seven or eight miles per hour on its journey in from the country, which was about all that could be expected since the car weighed with its passengers, over 1,000 pounds. This motor was afterwards replaced by a 2 horsepower, and the wheels were increased in size to 36 inches in diameter and provided with pneumatic tires; the speed of the car was thus increased to a maximum of about fourteen miles per hour. The best record I succeeded in making with it was five miles in 26 minutes, or an average of about twelve miles an hour.

THE HAYNES ANTOMOBILE CO.
Elwood Haynes, Pres.

Wound up Its Affairs Without Loss.

Generally speaking when a corporation reaches a point where it becomes necessary to "wind up" its affairs, the stockholders may rest assured their profit taking is at an end. Such proved not to be the case in the exceptional instance of the Torquay Motor-bus Co., of London, however, which recently got to the end of its rope. Contrary to precedent, the whole of the paid-up capital was returned to the stockholders, after the payment of a dividend of 7½ per cent. from the commencement of operations, in addition to which a bonus of upwards of 8½ per cent. remained to be disposed of. The decision to close out was the result of an anticipation of coming competition on the part of the electric "trams," and the business was terminated in season to prevent any losses to the company as a result of it. The 'buses which had been in use, were immediately turned over to another company and put into service at once at Harrogate.

Foreign Car Improved by American Parts.

An example of the superiority of the American cars over those of foreign manufacture was recently emphasized by an incident in New York. A Wall street man had purchased a very expensive foreign car, but continually complained of the noise made by the side chain. Many remedies were tried with little or no effect. Finally he obtained from the E. R. Thomas Motor Co. a set of both wheel and countershaft sprockets and chains and had these fitted to his foreign machine, and he now claims that the machine makes no more noise than a shaft driven vehicle, and yet has the advantage of the double chain drive.

Prussian Railways Adopt Motor Cars.

Virtually a complete transformation in the State railroad system is about to be introduced in Prussia, according to cable reports. On all except the main trunk lines motor cars similar to those in use on the Union Pacific's interurban lines, will replace steam locomotives. Prolonged experiments have proved gasolene motor cars possess immense economic advantages. Several hundred of these cars have been ordered, it is stated, each provided with a sixty horsepower motor.

"The A B C of Electricity."

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

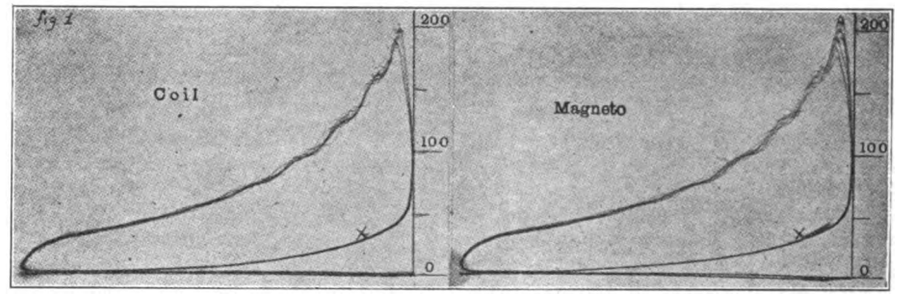
CONDITIONS AFFECTING IGNITION

Some Recent Tests and What They Indicated—Comparative Action of the Magneto and the Spark Coil.

Prevailing impression to the contrary notwithstanding, there has been up to this time no definite and analytical proof that the magneto gives better service in use or produces more efficient results from a given volume of gas than does the more familiar spark coil. That it is generally more certain in action, that it is not subject to the same irregularities as the other system, and that it is otherwise advantageous is commonly believed. It has remained for Dr. W. Watson, the English investigator, however, to prove that the supremacy of the magneto for all ordinary service is really what it is claimed to be by many engineers.

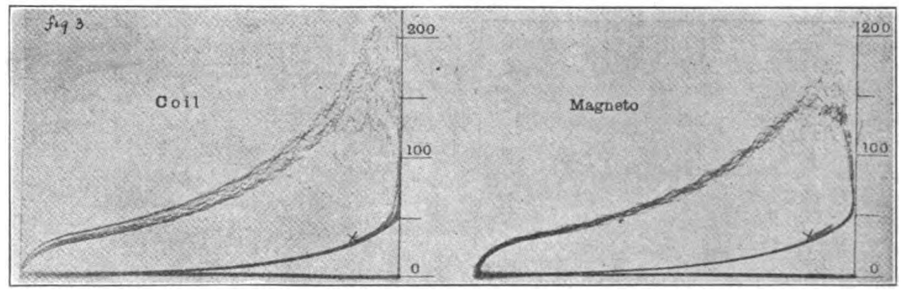


It was the same authority who, last winter in a paper read before the Royal Automobile Club announced the radical conclusion that the "fatness" of the spark had no effect upon the power developed by the explosion, the apparent loss of power in some cases observed when the spark was weakened, being due rather to the delay occasioned by the varying lag of the coil than by any variation in the quality of the ignition. At the time, considerable discussion was aroused, the paper in question being reported in brief in these columns in the issue of March 21, 1907.

The second series of tests was carried out with the same engine as was used in the first instance, that is to say, a twin cylinder affair with 3½ by 4-inch cylinders, the magneto and coil being so arranged that by means of a high tension switch the load might be shifted from one to the other instantly. The indicator employed was one of the optical type, of original design, and recording the cylinder pressures on a sensitized photographic plate, as may be done with the manograph. In every case, a "photograph of the spark" was taken on the plate, the exact instant of firing thus becoming a matter of automatic record with the diagram itself.

The earlier tests were made with the spark plug in its normal position over the inlet valve, both inlet and exhaust valves being located in a pocket at one side of the cylinder. The sparking points of the plug were 0.4 mm. apart, and running conditions were maintained uniform as nearly as possible in every case, the speed averaging about 900 revolutions per minute.

Two indicator diagrams, obtained when the best mixture of petrol and air was used, reproduced from the Autocar, are shown in Fig. 1, showing that there is no difference in the pressure developed, the timing of the two being so adjusted that both sparks



commence at the same point on the compression stroke. The small cross in all cases indicates the point at which the spark commenced.

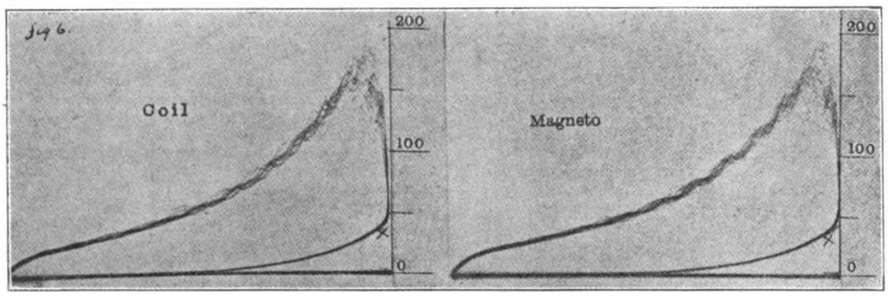
In Fig. 2 are shown two corresponding diagrams in which the mixture used is so weak in petrol that any further dilution with air caused the mixture to fail to ignite whether coil or magneto was employed. Here, again, there is no difference. The small spark due to the coil is just as efficient as the large magneto spark.

By adjusting the indicator so that the spot of light was traveling at its maximum speed while the ignition was taking place and the piston was practically at rest, a method of studying the relative rates of flame propagation was developed. The diagram thus produced was distorted greatly, but for purposes of comparison it served excellently. In this way it was found that the velocity of flame propagation was the same both for weak and strong mixtures, and regardless of the intensity of the spark. It is interesting to note, however, that the interval which elapses between the passage of the spark and the first appreciable rise in pressure, due to ignition, is about 0.003 second for the strong mixture, and 0.0065 second for the weak.

"The above series of experiments simply confirm the results which the writer had previously obtained, using different intensities of sparks produced by coils, and they do not explain the marked improvement obtained by some observers when using a magneto," remarks Dr. Wilson. "The only probable explanation of the discrepancy seems to lie in the difference in the shape of the combustion space. . . . .

"Since it was not practicable to change the shape of the combustion chamber on the engine, the position of the spark plug was altered, which comes to very nearly the same thing as far as the question under consideration is concerned. A second spark plug was screwed into the hole provided for the compression cock, which is on the side of the cylinder opposite to the pockets containing the valves. At first the sparking points were placed so that they were in a hole ⅝ inch in diameter, and at a depth of one inch from the inside of the cylinder. A certain amount of to and fro movement of gas takes place past the points in this position, since the gases which move into and out of the indicator have to pass down the hole. By means of a switch the spark due either to the coil or the magneto could be caused to pass either through this spark plug or through the ordinary plug placed over the inlet valve.

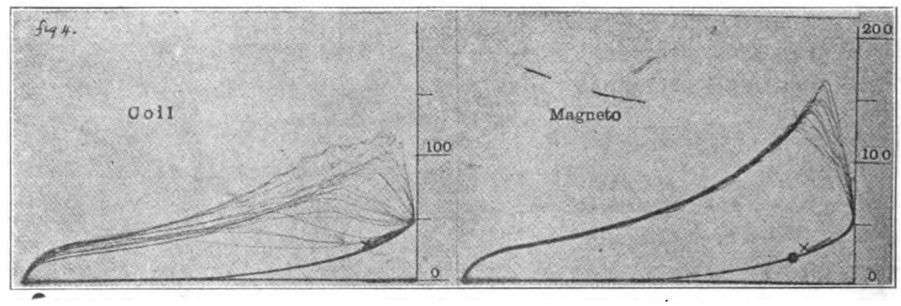
"With the spark at the plug in the hole in the side of the cylinder, which may for short be called at the back of the cylinder, it was at once seen that there was a difference according as to whether a coil or magneto was used, i. e., as the intensity of the



Digitized by Google

spark was changed. In the case of the mixture of petrol and air giving the maximum pressure, the difference is illustrated in Fig. 3.

"In the case of the magneto the charge is fired quite regularly, and the work done in successive effective strokes is sensibly constant. With the coil, on the other hand, misfires are fairly frequent, and as each misfire is followed by a stroke in which, owing to scavenging, the quantity of charge is larger than usual, and hence the pressure developed is above the average, the work done in successive strokes varies considerably. . . . .

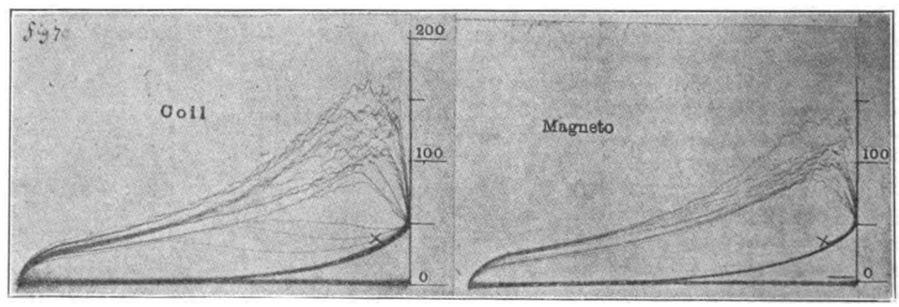


"With a weak mixture, Fig. 4, the difference between the effects of the two kinds of spark is even more marked.

"Since the spark plug at the bottom of a hole is not an arrangement likely to be used in practice, a new plug was made of such a length that the sparking points just reached to within the cylinder, and hence the arrangement was practically identical to what is used in some engines where no valve pockets are employed. In this case, with a strong mixture very little difference between the two kinds of spark was obtained, as will be seen from Fig. 6. Further, the rate of ignition was practically the same.

"With a weak mixture, however. there was still a marked difference obtained with the two kinds of spark, as is shown in Fig. 7, where it will be observed that the coil often failed to ignite the charge, and hence, owing to scavenging when an explosion did occur, the pressure produced was much above the average. These two diagrams illustrate very clearly a case where the magneto has a distinct advantage, for with the strength of mixture used the work done in the successive strokes does not vary to any serious extent, and hence the engine will run regularly. With the same strength of mixture, however, the engine runs very irregularly with the coil, as, owing to the misfires and strong explosions by which they are followed, the work done in successive strokes varies very greatly, and the engine thumps. In order to make the engine run regularly with the coil the mixture has to be stronger, and then the power developed is greater, so that the flexibility is reduced. . . . .

"In order to obtain some idea as to the relative 'fatness' of the spark an ordinary sparking plug was fitted into a small glass globe, an inclined water manometer being also attached to the globe, forming a Riess's thermometer. Thus when the spark passes the air in the globe is heated and the pressure of the air rises. The engine being run on one cylinder, the high tension current which ordinarily was used to fire the other cylinder was taken to the plug in the thermometer, and the movement of the surface of the water in the monometer during ten seconds was observed the engine being kept running at a constant speed. In this way it was found that the heat developed at the spark gap by the magneto was very nearly ten times the heat developed by the coil. The conclusions to which the above experiments point are as follows:



"1. With an engine in which the inlet valve is in a pocket and the spark occurs in this pocket, neither the pressure developed nor the rate at which the charge burns depends on the intensity of the spark or whether it is due to a coil or a high tension magneto.

"2. With an engine in which the spark occurs inside the combustion space over the piston there is very little difference as long as a mixture is used which does not depart much from that which gives the maximum pressure. With weak mixtures, however, there is a distinct advantage in using a very intense spark, such as is given by the ordinary magneto.

"3. The well known fact that an engine with the valves in pockets is more flexible than one without pockets is seen to depend on the fact that in the case of the engine with pockets the mixture in the neighborhood of the spark is stronger than the average. Hence the ignition of the charge is started in this stronger mixture, and once being started, spreads to the rest of the charge. Where no pockets are present the portion of the charge near to the point at which the spark occurs is no richer than the average, and hence the average richness must be at least equal to that of the richer portion of the charge in the engine with a pocket, or a misfire will occur.

"The above remarks apply to the case where the mixture is never too strong. If, however, closing the throttle caused the strength of the mixture to increase to such an extent as to be richer than the normal, then it was found that firing the charge over the inlet valve was a disadvantage, as greater flexibility was secured when the charge was fired in the combustion chamber. The reason being that, as has already been pointed out, the charge in the pocket is always richer than the average. Hence, if the average charge is already too rich, the charge in the neighborhood of the spark may be too rich to fire. It will thus be seen that the question as to what kind of spark is best involves not only the position of the sparking plug, but also the peculiarities of the carburetter and method adopted to throttle the engine.

"4. Finally, it seems probable that in most cases where improved running has been observed in the case of a multi-cylinder engine in particular, on the replacement of high tension coil ignition by high tension magneto ignition, the improvement is due to improved timing obtained owing to the replacement of the trembler coils by the make and break of the magneto."

ADVANTAGES OF THE STUB-TOOTH

Its Economy of Wear and Constancy of Force in Gear Action — Principles Embodied in Its Design.

With the rapidly growing adoption of the so-called "stub-tooth" gear in motor car transmissions, considerable interest has been aroused in the system upon which it is based. Ordinarily it is sufficient to explain that the stub tooth is like any other tooth except that it is shorter, or that a 6-8 pitch pinion, has the same dimensions as the standard 6-pitch pinion, with a tooth of the length which would be used on a standard pinion of 8-pitch formation. The inexactitude of this explanation, however, is apt to be more or less confusing, besides which the mere idea of added strength which it conveys fails to carry all the advantage which the system actually possesses.

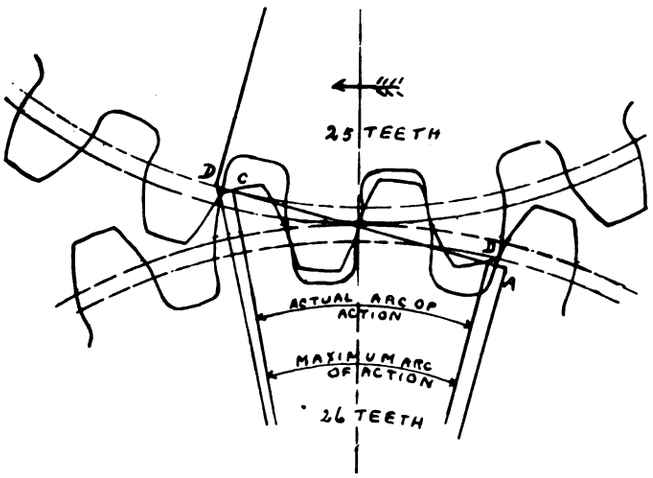

FIG. 1

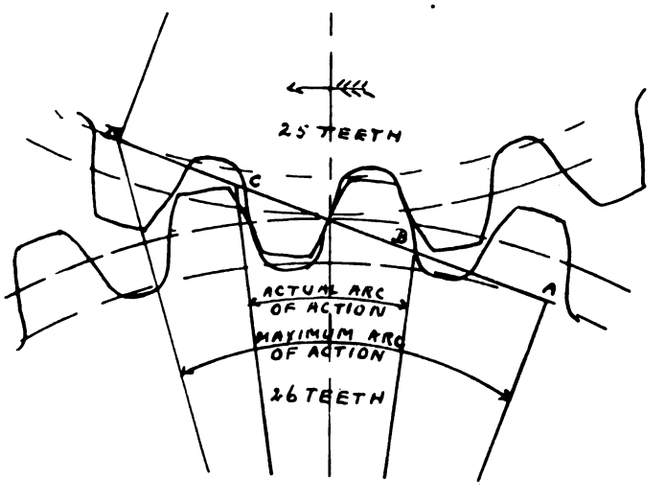

FIG. 2

In a very convincing monograph on the subject recently published by the Fellows Gear Shaper Co., the advantages brought out by stub-tooth design are explained by means of a number of diagrams. The following extracts are intended to bring out the points of excellence of the system without going into the more intricate theoretical details.

Regarding merely the ideal conditions, the following quotation comprehends the entire basis of gear design: "The two most important are the securing of the nearest approach to a rolling action that it is possible to obtain and the strongest tooth that will meet this condition. The first includes easy running, reduces the friction to the lowest point and consequently has the least wear in action. We are apt to think of the present standard gear tooth as one of the fixed laws of mechanics and that it represents the highest development possible in this line just as we consider the question of threads fixed by the Sellers or United States Standard form of thread. But this is not the case, and while there is always a perfectly justifiable reluctance about departing from such a standard as the gear tooth it is at least good policy to know both sides of the question and see if the advantages claimed for the newer form of tooth can be backed up with positive proof.

'The so-called standard tooth of to-day is the involute curve with the 14½ degree angle of obliquity or pressure angle, but its use is not as universal as might be supposed and the newer form known as the 'stub-tooth,' with its 20 degree pressure angle is growing into favor faster than many realize."

Going back into gear history a little, the author touches upon the earlier tooth shapes, of which he says: "The first that were worthy the name were of epicycloidal form and measured by circular pitch and, as the state of the mechanic arts had not advanced to the point of cutting teeth in a machine, the gears were in most cases made with cast teeth in the foundry. The rest were cast without teeth and these were made of wood and driven into the rim by the old-time millwright.

"With the epicycloidal system it was necessary in order to avoid the excessive under cutting of the flank of the tooth, to adopt certain proportions of form and length of tooth, which gave continuous action when the gear of 12 teeth was used. Proportions for the length of tooth and other dimensions that were originated when the science of applied mechanics was in its infancy have been handed down to the present time with little change, regardless of the fact that with the dropping of the epicycloidal form of tooth, the conditions have been entirely changed. . . . . The adoption of the involute form of tooth, together with the diametral pitch system of measurement, has been gradual but constant. and it has now practically superseded all other forms. . . . .

"With an interchangeable set of gears the length of the tooth should be sufficient to give an arc of action equal to the pitch arc, even with the smallest pinions. This will keep one pair of teeth in contact until the next pair is in position to take up the load. There is, therefore, a fixed relation between the length of tooth and the angle of obliquity. In ordinary practice the number of teeth of the pinion is limited to 12, and the length of the tooth ordinarily adopted is such that the action is continuous.

"It is, however, a fallacy to argue that the teeth should be as long as possible, with the idea that a gain is made if two or more pairs of teeth are in mesh at once. Conditions are never such that an equal division of the load is possible, and a length of tooth beyond that which is necessary to insure a continuity of action, produces undue friction and wear. The best results are obtained when the arc through which the action of a pair of teeth takes place is from 1¼ to 1½ times the pitch arc.

"Although the subject of gearing has been investigated and discussed at great length by many mechanics, there is one phase of the subject that has received but scant attention, and this is the co-relative effect of the angle of obliquity, or pressure angle, and the length of the tooth upon the efficiency and wearing qualities of the tooth itself. It can be shown that an excessive sliding action takes place at a certain portion of the tooth action between gears having teeth of the standard or 14½ degree angle, and that by increasing this angle it is possible to so shorten the tooth that only such portions of the curve are used as will give nearly a complete rolling action."

The accompanying figures, 1 and 2, show the respective outlines of the standard and stub-tooth contours, and also indicate their respective merits. Thus in Fig. 1, the actual arc of action, B-C, lying along the line of action which is pitched at 14½ degrees to a line drawn tangent to the pitch circles of the two gears at their point of contact, is seen to be much longer than the corresponding line, B-C in Fig. 2, while in this case, the difference between the actual and maximum arcs of contact is greater in the second than in the first instance.

Remembering that the ideal is to secure the mesh of the gears with the least possi-

Digitized by Google

bl sliding and the closest possible approach to simple rolling, it is evident that as the arc of actual action increases, under the conditions shown in Fig. 1, the amount of sliding between the points and flanks of the teeth also must increase since in the first case the points of the gears are approaching each other more rapidly than in the second, even though in both cases the angular movement about their centres is the same.

In other words, where the arc of contact is long, the points and flanks of the teeth are subject to a greater amount of wear than where it is short. It is also true, that whereas in the first instance three pairs of teeth may be in contact at the same time, in the second only two pairs at the most may contact at once. This, however, is compensated for by another feature of the stub tooth, which is its great strength at the base. The difference then, is roughly, that of shifting the load from three points to two points, without altering the load-carrying power in either case, since it may be considered that practically an equivalent amount of metal is carried in either case.

Referring to the subject of the wear which must occur between the points and flanks of long-toothed gears, the author says: "The action of the standard tooth at the base line, is that of a stone boat being dragged over the ground while the action of the stub-tooth can be compared with the same stone boat mounted on wheels.

"It is, of course, impossible to entirely eliminate the wear between the teeth of gears working under a load. But if the wear can be evenly distributed over the entire working face of the tooth, the correct form of tooth is retained indefinitely and a worn out gear should, aside from excessive backlash, run as well as a new gear. . . . .

"Because of the fact that the tooth has been shortened and at the same time widened at its base, there is a very substantial gain in strength which in some cases amounts to nearly 100 per cent. and the fact that we can many times practically double the strength of a tooth is certainly worthy of serious consideration. . . . . It should also be noted that the gain in strength is greatest in the case of the smallest pinion, which is a very great advantage, for as a chain is no stronger than its weakest link, so a train of gears is no stronger than the teeth of its smallest pinion. This, in addition to the clearly demonstrated fact of easier running and reduced wear, should command careful consideration for the form of tooth here advocated. . . . ."

A comparison of the standard and stub-tooth systems made on the basis of strength alone shows that the latter, though much shorter, has 20 per cent, greater strength and that while the bearing surface "per tooth" is shorter, the total area of bearing surface is 6 per cent. greater.

Thus it appears that the stub-tooth is not merely a shortened tooth, but that it comprehends a structure altered from the regular standard tooth in two important ways. That is to say, that it is so constructed that the pressure angle between any pair of teeth in contact is greater than in the standard gear, and the width of the tooth at the base is greater. As a result of this, there is less wear at the points and flanks of the teeth, and the strength of the tooth is greatly increased. Although commonly mentioned as more or less of an innovation, the Fellows company point out that it is by no means the actual novelty it seems, having been first introduced by them in 1899, as they state.

Disadvantage of Racing the Motor.

While the motorist frequently is advised not to race his engine, the exact nature of the disadvantage is not uniformly understood. In the first place, running the engine at a speed greater than that for which it was designed, involves straining it excessively owing to the inertia of the parts and the tremendous vibration which this produces. More than this, however, excessive speed of revolution involves additional wear and may be compared to a certain amount of extra use.

Thus if the normal speed of the engine is 1,000 revolutions per minute, accelerating it to 1,200 revolutions, means that the crank shaft must turn over no less than 12,000 times more in the course of an hour than it would do at the normal rate of speed. This is equivalent to 12 minutes of extra running at the normal rate. Hence with even this moderate acceleration continued uniformly, it may be said that for every five hours of running, the motor parts receive an amount of wear equivalent to that of six hours under more nearly standard conditions. In this way it is very easy to account for the comparatively short life of many motors.

Roughly speaking, there should be no reason why the motor should not be run at any speed which happens to suit the convenience of the operator, so long as sufficient power can be developed. But the fact that the rigid conditions of design compel the adoption of systems of balance based on certain fixed speeds, which thus become the "normal" rates at which the best efficiency and power are secured, makes it imperative that however much the engine may be below or above the requirements of the car, it should never be permitted to exceed its rated speed for any length of time.

When a Built-up Steering Knuckle Fails.

Occasionally an apparent distorsion in a built-up steering knuckle, resulting in the disalignment of the front wheels, may be due to the shearing of the key holding the steering arm in the knuckle, and not to the bending of the arm, as appears to be the case. On this account, whenever the system is found to be out of line, the condition of this member should be examined with extreme care. If the failure is due to no apparent cause, it may be taken for granted that the original key is too light for its work, and the part should then be reinforced by adding another, besides reseating the old one. In doing this, however, care should be taken not to weaken either part any more than is necessary.

Comparison of Power Ratings

There has been a decided change in recent years among American automobile manufacturers in regard to power rating. While a few years ago the foreign rating was considerably lower than the American, the same cannot be said to-day of the better class of American cars. An instance of this is shown by a comparison of the ratings in a table compiled by "L'Auto" of Paris, showing the details of some of the high grade six-cylinder motors at this year's Paris show, and the rating of the Thomas 6-70 Special as an example of the highest grade American car. "L'Auto" lists but one car of as large a cylinder bore as the Thomas Six and gives that car a rating of 75 catalogue horsepower. At the same time it lists a car of 120 mm. bore at 70, one of 130 mm. at 75-80, one of 130 mm. at 75, and one well known German car of 120 mm. bore at 75. The Thomas has a bore of 5½ inches or 139 7-10 mm., and the makers give this car a rating of 70 horsepower, thus showing that they are really more conservative in their rating than European makers

Keeping Truss Rods in Position.

It is important to bear in mind that truss rods used in staying live rear axles must retain their proper position if the alignment of the axle as well as its endurance are expected to come up to specifications. On this account these members should be inspected occasionally, and their adjusting nuts taken up in case any sag is observed in the casing. In doing this, care should be taken to exert a uniform degree of pressure on both sides, so as not to stress the casing unevenly or warp it. In case of an accident in which one of the stays becomes kinked, of course the whole group should be gone over with extreme care, the bent member straightened out and the alignment of the tube and shaft bearings readjusted if it is found not to be true.

Causes of Stiffness in Steering Gear.

Any unnatural stiffness in the steering gear should be sufficient cause for an immediate investigation. In some cases it may be produced by lack of proper lubrication in the knuckles, or by a similar difficulty in the reducing gear. In others it may be due to some more serious cause, like the bending of the steering column, causing the shaft to bind, or some loss of adjustment whereby the gears do not mesh properly. In any case, it usually happens that the remedy is a simple one and quickly applied. Prompt correction of the difficulty, however, may be the means of saving the owners' life.

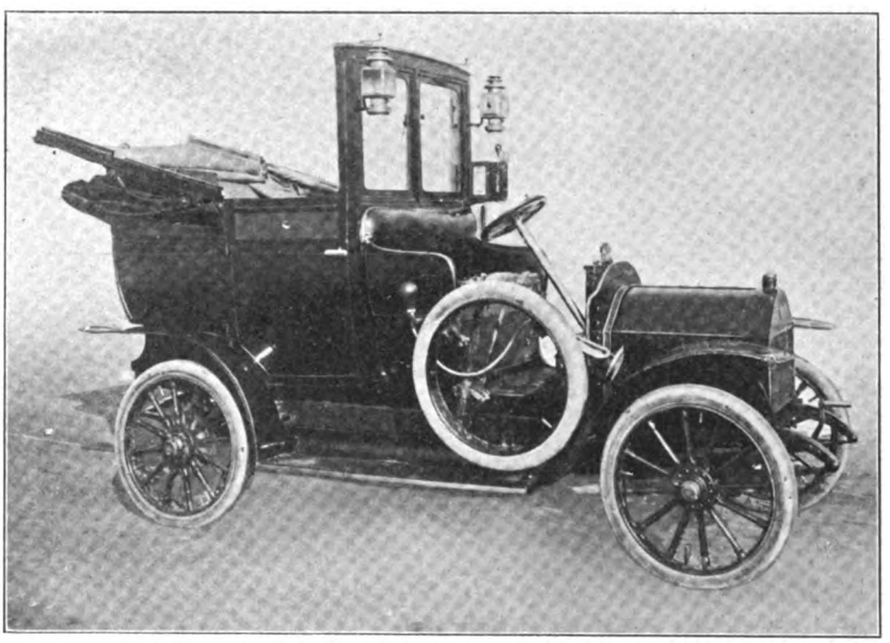
SUCCESS OF THE TAXICAB SERVICE

Rapid Increase of These Vehicles in New York City—Why, as yet, All are of Foreign Make.

No transportation innovation of recent years has attracted more attention on the part of the public and the trade than the "taxicabs" or "taxacabs," as they are variously spelled, which are now to be seen in great numbers on New York's streets.

To the public they are giving a realization of cheaper cab fares; to the automobile manufacturers they suggest new business opportunities, and to a host of drivers they represent a chance to earn money at a rate previously thought of only in their dreams. In fact the taxicab may be said to have taken New York by storm, and the probability that it will soon be conquering other cities in much the same fashion lends an interest to the problems that the operating companies have so far encountered in making it a paying proposition during their comparatively brief experience with it.



Two rival companies operate gasolene taxicabs in New York. The taxicab as a settled fixture in New York was introduced only so recently as September 30, 1907, by the New York Taxicab Co., and about the same time the New York Transportation Co., which has for years been operating the electric cabs, disclosed a number of gasolene cars fitted with taximeters. All of the gasolene cabs are imported from France, the Taxicab Co. employing four cylinder Darracqs and the Transportation Co. using two cylinder Delahayes.

The Taxicab Co. has at the present time about 250 of the natty, red Darracqs in service, and is getting about 75 more per month from abroad. The green Delahayes of the Transportation Co. are fewer in number, about 50 of them being in service at present, but it is understood that a large, further order has been placed and that they will soon be plentiful. Recently, the electric cabs have been equipped with the self-indicating and self-registering taximeters, and rapidly are losing their old designation "hansom" in favor of the more modern term "taxicab."

Officials of both companies agree that no American manufacturers are as yet prepared to make satisfactory quantity deliveries of suitable cabs, and intimate that the American makers have been in no little degree short-sighted in not making greater preparations for a class of business that bore unmistakable signs of inevitability.

"Much as we would like to patronize American manufacturers," said President Harry N. Allen, of the New York Taxicab Co., when asked concerning such heavy purchases abroad, "we could not take the risk of buying untried cabs even if the local makers were in a position to deliver the quantities required. It is altogether too dangerous from a business standpoint to take the risk of buying cabs that might not stand up under the hard usage we would give them. Before buying the cars we are now using, we tested several of them for as much as two years and had the benefit of seeing them in actual service in large quantities for an extended period. Every American cab offered to us so far has been purely an experimental affair, with no record of actual performance behind it.

"Just think of it," Allen continued, "a great many of our cabs go between eighty and ninety miles a day right along, without repairs of any kind and in the hands of all kinds of drivers. When American makers can show us actual records of that kind, then we will be ready to talk about buying."

FOUR CYLINDER TAXICAB EMPLOYED BY THE NEW YORK TAXICAB CO.

Secretary Palmer, of the New York Transportation Co., likewise felt that his company could do better abroad, in getting cars that had proved themselves suitable for taxicab service, than in placing orders for large quantities of American cars that had yet to prove themselves capable of meeting the peculiar conditions of cab work.

Although built abroad, President Allen does not find that the French products are in any way unsuited to New York's streets. Outside of the cities they would be under a great disadvantage compared with American cars, he admits, but metropolitan service is about the same in Europe and America.

"In fact," he said, "the physical conditions in New York are in many respects better than they are in either Paris or London, and we have no reason to anticipate that repair or maintenance charges will be any higher here than they are with the same vehicles abroad. The earning power of the cabs has exceeded what we originally calculated on, and we have reached a stage where we know positively that our venture is a success. Of course, there is a great deal more to the business than merely getting the cabs. It is in the management of them after you have them that the real test comes. By getting the exclusive stand privileges at some of the most desirable points in New York we have managed to organize a system which insures the cabs having fares and being kept busy practically all of the time, which is the secret of their success. It was in getting the stands that we wanted we met all sorts of trouble and difficulty, but now that we have shown what we can do we are making new conquests every day. For instance, this week we start in to supply the cab service for the New York terminal of the Lackawanna railroad, and shall announce further victories before long."

Among the more prominent of the Taxicab stands are the Plaza Hotel, the Knickerbocker, the St. Regis, the Calumet Club, the Racquet and Tennis Club, Bretton Hall, the Manhattan Hotel, the Delaware & Lackawanna station, and the Pennsylvania railroad terminals. The New York Transportation Co. also has a number of prominent stands, including Martin's and other fashionable restaurants, and various hotels and depots, where their gasolene taxicabs are in line with their electric cabs, of which many are now fitted with taximeters.

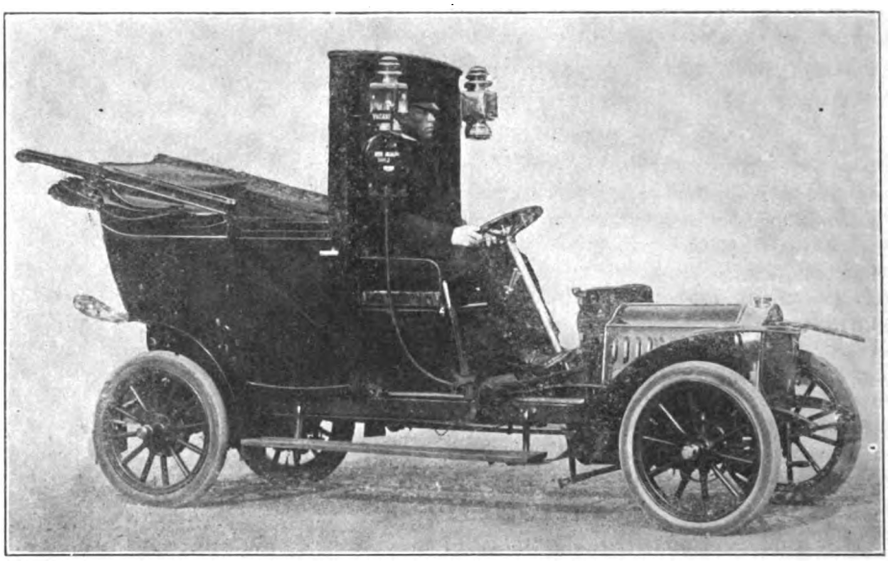
Both companies arrange the movements of their cabs to minimize their traveling empty on return trips. Returning without paying passengers is a waste that is the bugbear of the traffic manager. The New York Taxicab Co. has its drivers drop in at their nearest stand on a return trip, where the starter at the stand will put

Digitized by Google

them into line if they are not needed more urgently at some of the other stands. All of the stands are in constant communication with the central office, so that the distribution is made to the best advantage. A cab taking a "fare" from the Lackawanna station, which is pretty far downtown, to some point away uptown, instead of returning empty all the way back to the station, would stop at the Bretton Hall stan the furthest of the uptown stands, where it would be ready to take passengers downtown on call, while, similarly, cabs going to the railroad station from Bretton I. would remain there for uptown "fares."

The same general principle is employed by the New York Transportation Co., so far as its system of stands will permit, but the management goes a step further in reducing the empty traveling. Through newspaper advertisements the public is urged to hail their cabs "whenever the flag is up," which means whenever the taximeter displays the sign "Vacant" on the little metal flag, which controls its operation. The men are encouraged to "pick up" fares on their return trips as far as possible, and a system of bonuses for the drivers most diligent in "picking up" is being devised.

The newspapers are also used by the Transportation Co. in connection with the telephone directory to acquaint the public with the advantages of taxicab service and the reasonableness of the tariffs. Each advertisement sites some feature of the service and directs the reader to consult the first inside page of the telephone directory for the full schedule of tariffs and an explanation of the operation of the taximeter device, together with the rules to be observed in seeing that the correct amount is charged. Needless to say this puts the whole taxicab offering ready to the hand of any one who wants to know about it.



With a prophetic eye, Secretary Palmer looks forward also to the day when every New Yorker who rides in cabs will be equipped with a "cab whistle" with which he may hail taxicabs from the sidewalk when he is so inclined.

"In London," he said, "every habitual cab rider has his cab whistle. When he wishes to hail a cab from where he is standing, he simply blows on it once or twice and the trained cabbies soon appear with a rush. In the morning as he is finishing breakfast at his home or his club, he has a servant go out on the front stoop and blow a few blasts and by the time he is ready to go a cab is outside waiting for him. As taxicabs grow in use in New York, the habit of whistling for them will probably become just as common as it is in London, and if it is, it will mean a great economy in cab operation as the men will thus be able to make frequent 'pick ups' on their return trips."

As yet, the "pick up" has not been officially incorporated in the Taxicab Co.'s system of avoiding empty runs. This is because of a legal difficulty which the company stumbled against early in its career, due to the two classes of hacking licenses which are issued by the city. In addition to the state automobile license for each car, and the chauffeur's state license, the company provides its men with hacking licenses of the class which apply where the drivers operate from stands instead of "cruising" up and down the thoroughfares. Recently a passenger emerging from the Grand Central station hailed one of the company's taxicabs and started to get in. A policeman promptly interferred and told the taxicab driver that if he attempted to take a passenger on his return trip in that way, arrest would follow, since the Taxicab Co. did not have a stand at Grand Central station. Lawyers for the Taxicab Co. have been set at work on the question as to whether the men when thus hailed may take passengers, and it is probable that before long a test case will be made of it.

Wide difference in management ideas appear between the two companies. The drivers for the Taxicab Co. are paid a 20 per cent. commission on their receipts with the privilege of working as many hours a day as they like, while the Transportation Co. drivers are paid a salary and are limited as to the number of hours they work. As far as possible, the drivers for the former company are kept responsible for certain cars which they drive, though when cars are standing idle in the garage they are often assigned to substitute drivers when they are needed at any of the stands. The Transportation Co. holds one driver responsible for a car, but in rush times assigns two men to a car and divides the responsibility between them. Various bonuses are offered by both companies to drivers showing the best records of receipts and keeping their cars in the best condition. The salary of the Transportation Co. drivers is $2.50 a day, supplemented by whatever tips they may get, while the Taxicab drivers, with the temptation to work longer hours, manage through their percentage and tips to get about $7 a day, according to some estimates, while under particularly favorable circumstances a day's earnings may net them $10 or $12.

As indicating some of the modern phases of the automobile business the tire contract which the Taxicab Co. has with an American tire concern is illustrative. All tire repairs and replacements are made by the New York branch of the tire company and the Taxicab Co. simply pays under a contract for so many miles of tire service. The taximeters keep a record of the mileage and the tire company is paid according to the readings. The tires must be kept in good condition both for service and as to appearance. In this way the cab company reduces its tire expense to a known cost, on the mile unit basis, and shifts all the bother of the work on the tire company.

TWO CYLINDER TAXICAB EMPLOYED BY THE NEW YORK TRANSPORTATION CO.

The latter company uses 4-inch tires on 30 wheels, believing that despite the greater first cost there is an economy in having the large size. Its Delahaye cabs, after being received on this side, are all equipped with Midgley rims, which permit rapid replacement of a punctured tire. Each cab carries an extra shoe and inner tube. The puncture problem is met by the Taxicab Co. through the Stepney spare wheels with which its cabs are equipped when they are shipped. In case of a puncture, the spare wheel, which consists of a rim carrying a fully inflated tire and having grappling devices for fastening it to the outer edge of the clincher rim on the vehicle wheel, is clamped flat against the outer side of the vehicle wheel. Since the tire on the spare wheel is inflated and the one on the vehicle wheel is deflated, the former takes the con-

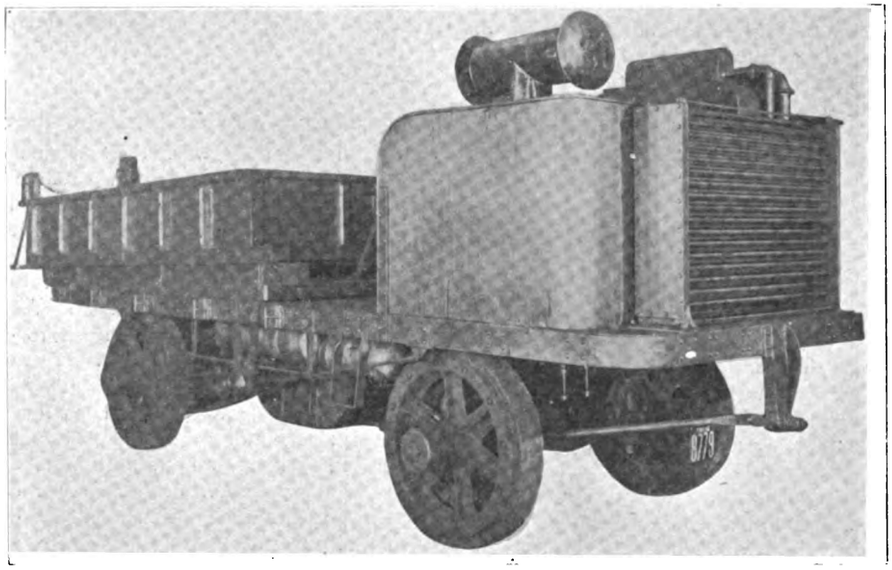
Digitized by Google

tact with the ground, although they are side by side like twin tires.

"It will take some time for the public to get thoroughly used to the taxicab and its system of charging," said Secretary Palmer, of the Transportation Co., in speaking of the change. "We have had several kicks at different times from people who thought they were overcharged until we pointed out to them where the fault lay with them. One woman not long ago complained that one of our taxicabs charged her 60 cents more for going from Sherry's to the West Twenty-third street ferry than she had ever paid a horse cab for the same trip. By questioning the driver we learned that while going down Fifth avenue in our cab she saw a friend in a passing hansom. She directed our driver to turn around and overtake the hansom. He turned, but was held up in the traffic at a crossing, and delayed in the jam when he did get across so that the hansom was about three-quarters of a mile up the street before it was overtaken. After speaking to her friend, she had the taxicab resume its trip to the ferry, but there was an extra mile and a half on the taximeter. She finally agreed that the charge was all right."

Station Master Alfred Camacho, of the Taxicab Co., under whose eye the cabs go in and out and who is the director general of their activities finds many surprises in the various effects of weather.

"You would think," he said, "that rainy weather would be the best for the taxicab business, because people, instead of walking in the rain, would call a motor cab. Nevertheless our very best business is on bright holidays and Sundays, and not on the rainy days. It is true we have more calls on the rainy days, but they are all little short trips, while on the fair days, the cabs are hired for all afternoon or for long continuous trips, which mount up in the receipts. The cabs are being used for weddings, funerals and all kinds of functions."



Unofficial estimates place the gross earnings of the Taxicab company's machines at from $30 to $35 a day, while the earnings of the Transportation company's cars are not quite so high. The latter have a maximum speed of about 21 miles an hour, while the Darracqs of the other company, with a four-cylinder motor of 12-14 horsepower, are capable of 35 miles an hour. The taximeter charges are the same for both companies, the fare for two passengers being 30 cents for the first half mile or fraction thereof, 10 cents for each succeeding quarter mile, and 10 cents for each six minutes of waiting.

President Allen, of the New York Taxicab Co., is making arrangements for corresponding companies in Chicago, Philadelphia, Washington and other cities, but no very active work is being done as yet owing to the difficulty of getting the cabs. The New York company, he says, will need all the cabs that the Darracq factory can send over for some time to come.

STEAM TRUCK FOR HEAVY HAULING

New Jumbo of Road Vehicles, with Capacity for 8 to 10 Tons—Special Details in Its Construction.

One of the most massive commercial vehicles of American construction yet put into service, and one the construction of which in every way inspires confidence as to its stability and durability, is the new heavy steam truck which has just been evolved by the Pittsburgh Machine Tool Co., Allegheny, Pa., and which is here illustrated. Unlike many of the heavy duty vehicles now being produced, the Pittsburg is propelled by steam power, a special plant complete and up to date in every respect having been designed for the purpose. As shown with dumping body intended for the haulage of brick, it has a rated capacity of 8 to 10 tons, thus bringing it well up into the front rank of Jumbo road vehicles, regardless of method of propulsion.

STEAM TRUCK WITH CAPACITY FOR 8 TO 10 TONS

The fire tube boiler is mounted on the foot board in front, the condenser being placed at the front, equipped with the usual air and feed pumps. The engine is of the three cylinder, single acting type, mounted under the body in the waist of the machine, and drives the rear wheels independently through a reduction gearing affording two possible speed reductions, and side chains, running from the differential counter shaft. An auxilliary device, also of extreme importance in a machine of this class, is the independent hoisting winch, which is mounted transversely of the car, with its winding drums placed outside and about midway of the body. All working parts are fully enclosed by a metal casing under the platform, and the tanks are located under the platform and beside the engine casing.

The frame is of riveted channel steel, the top plate being ¼-inch thick. Stake pockets, together with a set of steel stakes are a part of the regular equipment. Contrary to common practices, the wheels are steel castings, mounted on special bearings. The general construction follows the lines of motor car design, except in the matter of such reinforcements as are required on account of the unusual stresses to be met. Fore these, special provisions have been made, as in the trussing of the platform and the staying of the front axle by means of radius rods extending in the form a V, froma special bracket depended from the front of the platform to the ends of the steering axle. The special form of trussed axle casting also is of interest in the same connection.

The truck is equipped with two sets of brakes, one, consisting of an outside shoe system, applied by hand, and the other an air brake of approved construction. The latter is applied to a drum surrounding the differential group, and is of the contracting band variety.

Two New Plugs in Sta-Rite Family.

Two new spark plugs have been added to the Sta-Rite family of the R. E. Hardy Co., of New York. The first is styled the Gotham Sta-Rite, and its chief feature of difference from its brothers is that it has an extended shell partly enclosing the inner end and protecting the porcelain from heat, oil or soot. The porcelain has a single hollow tube packed with copper asbestos filled gaskets which cannot become wedged in. This plug is particularly recommended for engines using a great deal of oil. The other new addition to the family is the No. 4 A magneto plug, in which the insulated electrode has an enlarged head equipped with four points, any one or more of which will serve as a jumping point for the spark. Much greater efficiency is claimed for it in connection with a magneto than for a single gap plug.

Newest of Continental Motors.

Among the products of the Continental Motor Manufacturing Co., Muskegon, Mich., the most recent in the new type "K" motor, which may be characterized as possessing all the excellent features of previous models together with a few additional ones of its own. It is of the four cylinder vertical type, has cylinders 4¼ by 4½ inches, bore and stroke, and is rated at 24-28 horsepower. Complete, it weighs 360 pounds.

The general construction is the same as that of former Continental models, that is to say, the valves are all located in offset pockets on the same side of the crank case—the right in this instance—this arrangement, together with the placing of the carburetter, timer, magneto, pump and fan driving belt on the same side, making it possible to make all ordinary repairs and adjustments from that side alone, and rendering the entire removal of the hood a rare necessity. In the standard arrangement, the exhaust manifold is outletted at the forward end of the motor, the intention being to lead the waste gases back under the steering gear and to the muffler in the rear on the right side of the car. An alternate arrangement, however, provides for leading the exhaust from the centre of the manifold between the twin cylinder castings, and so to the rear of the machine on the left side as is more commonly done.

The cylinders are offset, as is done in all recent Continental motors, the location of the auxilliaries provides for the use of but three timing gears instead of five or six as are frequently required, the cams are made integral with the shaft and with the mushroom valve lifters, are carefully ground and hardened, and both the magneto and air circulating pump are arranged to be readily removed either for inspection or repair.

One of the special features of the machine, however, is the automatic lubricating system, which is the same as is used on the larger motors of the same family, but adapted for this particular machine. The usual splash system is employed, constant level being secured regardless of external conditions, by the use of a separate overflow chamber or sump in the engine base, from which the oil is raised to the crank pits by means of a small gear pump driven from an extension of the timer shaft. Oil pockets of suitable size are cast over each of the crank shaft bearings for the accumulation of the splash, a constant flow over all the bearings thus being secured.

Modifying Fan Action in Winter.

Considerable improvement may be obtained in the winter running of a motor, not infrequently, either by reducing the speed of the fan, or disconnecting it altogether. Generally speaking, a motor which is cooled so thoroughly that it never shows signs of overheating in summer, even in the hottest weather, and when running for a considerable distance at low rates of vehicle speed, will be found to require less draught in winter. Where the fan is belt driven, it is possible to reduce its speed either by slackening the belt tension—which is a slipshod and uncertain expedient—or by replacing one of the pulleys with another of different diameter. With the ordinary gear driven arrangement, the only practicable method is to disconnect the fan altogether, or else to alter its suction by replacing it or altering the gear ratio of the drive. Fans which are so constructed that the pitch of the blades may be changed through any desired range, are ideal in their adaptability to the varying conditions of winter weather.

Making One Nut Lock Another.

Failing a lock washer or regular lock nut, it is possible to secure a passable counterfeit for either by using two plain nuts screwed together with a little "grummet" of waste or spun yarn between them. After setting home the first nut, the thread of waste should be twisted around the bolt, close to it and in such a way as to embed it in the roots of the screw where the second nut is destined to come. This simple form of packing frequently lasts for a surprising length of time, and provides sufficient resistance to hold both nuts against any ordinary amount of vibration practically as well as the more mechanical device made for the purpose.

Adaptable Car for Physicians.

A recent invention in the way of a physician's motor car takes the form of a neat little inside driven landaulette which has divided seats. The left hand seat is made removable, and may be slid off the back of the machine, together with a small portion of the footboard, which is made integral with it. A couple of stretcher bars may then be attached to it, and the whole converted into a very passable carrying chair for an invalid. In case of an extreme emergency, the second seat may be entirely removed, when the floor along side the driver and extending to the extreme rear of the vehicle, may be used for the conveyance of a patient laid at full length.

Car Without a Radiator.

In a newly developed French car, no radiator is employed, the cooling of the jacket water being accomplished by direct contact of the air instead of by radiation through the usual cooler. To this end the hot water passes through a set of three nipples arranged in parallel connection, the jets thus formed passing through chambers which are so placed as to permit a considerable amount of cold air to be drawn in by the suction. The air and water mingle to a certain extent in passing to the tank, but are afterward separated by settlement, the heat being carried off by the air. The principle of the action is precisely that of the steam engine injector.

New Type of Material for Tops.

An entirely new type of automobile leather-autofoid, in which wonderful durability and richness are claimed to be obtained, has just been produced by the American Leatherette Manufacturing Co., Buffalo, N. Y.

The material is based entirely on chemical lines and is entirely different from the artificial leathers which have heretofore been on the market. Not only is autofoid a duplication of the leather itself, but it is waterproof, oilproof, dustproof and weather cured. This material is faced with leather on both sides and in the manufacture of tops does away with the extra lining which has heretofore been necessary, and at the same time adds richness of appearance. A big feature in favor of this material lies in the fact that the top builder can absolutely match the colors of the automobile upholstering and this gives a richness to the inside of the top without in any way making it appear gaudy, while dust and oil can readily be washed off with a hose without damaging the material.

Covering for Sliding Rods in Gearset.

For protecting the sliding rods in the gearset from leakage as well as to guard them from the effects of road dust, an exchange suggests the somewhat cumbersome expedient of covering them with leather protectors constructed on the general order of the bellows attached to the ordinary camera. One end may be attached to the gear box by means of a suitable junk ring of thin metal, while the other is secured to the outer end of the rod by a service of flexible wire. The cover itself may be made of pliable leather sewn together to form a long tube, and creased transversely to enable it to fold properly.

Position for "Pull-Out Rods.

Other things being equal, it is an advantage to have the gear striking or "pull-out" rods from the gear box taken from some point above the parting line of the two halves. By this means, any possible leakage which may result when the bushings of these rods have become worn is obviated, the gearset thus being rendered much cleaner than otherwise would be the case, while as a secondary, though perhaps more doubtful advantage, the effect of being able to lift off the actuating members with the cover also is to be considered.

Protection for a Tireless Rim.

To prevent damage to the rim when it becomes necessary to run for any distance without a tire, it is possible to construct a substitute of passable effectivenes by winding the rim with several layers of heavy rope or hawser, the layers being so arranged that when compressed by the load, they will spread out between the flanges, forming a compact and somewhat resilient pad, high enough to keep the metal from the road under ordinary useage.

FOR SPEEDY NEWSPAPER DELIVERY

Battalion of Specially Designed Cars Installed by a St. Louis Paper—The Transmission One of the Features.

Newspaper horses, the kind that go galloping through the streets faster than fire horses and that help make it possible for the average citizen to get a "six o'clock edition" at four in the afternoon, are to feel real motor competition in St. Louis. Instead of the newspaper races of the afternoon sheets being "hoss an' hoss," they will be "hoss" and automobile, fourteen special machines, as shown in the accompanying illustration, having been installed this week by the St. Louis Post-Dispatch for its delivery system to its distributing centers.

It is a proud set of newspaper drivers that is in charge of the new wagons, for not only are the latter speedy enough to hold their own against the horses, but they are fitted with wind shields and storm curtains, and for the winter months have an ingenious grating arrangement which permits the warmth from the air cooled engine to ascend to the enclosed front of the car, caressing the driver's feet and making the wagon as comfortable as a steam heated flat.

The wagons are Model R four cylinder delivery cars, made by the Logan Construction Co., of Chillicothe, O. The air cooled motors develop 20 horsepower. A special transmission is used, giving two forward speeds and one reverse, but the motor is geared so low that very little gear shifting is necessary, it being possible to take nearly all grades on the high gear even when the wagons are fully loaded to their 1,500 pounds capacity. The cars are required to make four trips daily, varying from four to fifteen miles in length. A special garage is being prepared for them, and Logan experts will take care of them.

READY TO RUSH THE NEWSPAPER TO ITS READERS

Automobile Buses for Railway Hands.

Automobiles to keep railway employes contented is one of the latest solutions for the labor problem as encountered by the Southern Pacific Railroad. The company removed its roundhouses from Rocklin, Cal., to Roseville, much to the displeasure of train and engine crews and roundhouse employes who owned their own homes in Rocklin. A mass meeting was held, as a result of which a line of automobile buses has been started to accommodate the men.

ARTISTIC SELECTION OF COLORS

Variety as the Saving Factor in the Painting of Vehicles—Its Differentiation from Sensational Color Schemes.

Apparently all colors lead to the automobile, and to the man on the box the query doubtless comes, "What is to be the final denouement in this drama of pigments?" We have heard no small uproar of argument concerning the disposition of the color problem in its relation to the automobile, but each builder, and, in turn, each painter appears to be a law unto himself in the choice of colors and combination of colors, according to the Carriage Monthly.

The determination of many builders, as expressed through the medium of the daily papers of recent issue, of adhering to individual or firm colors in the painting of the auto output, does not promise any definite or speedy settlement of the question of choice in the matter of color display. If anything, it assists to establish "confusion worse confounded." It is neither probable nor desirable, from the present viewpoint, at least, to witness what some recent writers have been pleased to call a "standard-

Digitized by Google

ization" of colors for use on automobiles. The results of any such invasion of the colorist's prerogatives would, if anything, be more reprehensible than the prevailing color discord. It would discourage any attempt to improve upon the colors in use, or the attempt to invent new colors. Standardizing colors for passenger equipment cars, upon railroads, has driven the colorists from the field of railroad work, and, in a sense, beggared the trade.

Variety in colors is in reality the life of the craft. Moreover, it is the one touch of art that lifts the painting of the horseless carriage above the labor of licking a smear of Venetian red over the family wash tub. But that variety, contrary to the intentions of its authors, has degenerated to a "vain show" of pigments having little to recommend them, beyond the mere notoriety which attaches to colors of a sensational or eccentric character.

Variety in colors is the saving factor in the painting of all vehicles, but it should be a variety based upon the sound law of harmony, appropriateness, reference of color to form, and a general unity of all the elements of color, finish and appearance. Manufacturers are already declaring through the columns of the daily press that a trained staff of experts are now working upon color novelties for the season of 1908.

Evidently we are to witness the same demoralizing exhibition of color sensations during next year that has in certain quarters been cheered to the echo during the season now closing. However, we believe that there is a little leaven working that will ultimately leaven the whole lump, and that out of the chaos of disputed color proprieties will emerge a style and choice of colors plentiful in variety, and strictly in accord with the best practices of colorists having a right to the title.

Turning to a list of the colors which the finest traditions of carriage painting have sanctioned for a quarter of a century, at least, and which list, let us say in passing, is sufficiently elastic to meet all the requirements of the automobile industry, we have more than 25 staple reds, fully half that number of greens, quite one-third that number of blues, a half-dozen lakes, several fine yellows, four or five attractive browns, with enough legitimate variations from these to give the automobile painter an opportunity to choose a color, or a combination of colors that will do credit to the sense of what is appropriate and beautiful.

Between the work of the premier craftsmen and the crude creations of the amateurs and the lackeys attending the sensation chariot, there is an insurmountable barrier, and once the public fully recognizes it, we may expect the reign of a better art sentiment in respect to the laws of colors as applied to the automobile.

To paint a vehicle with a paint costing $5 a pound may seem to the average man like an enormous waste of good money, but along the automobile Rialto, New York, you may hear it said that "nothing is too good for the automobile."

And this statement appears to be supported by certain incontrovertible facts, among which may be mentioned the use of madder lake in the painting. Incidentally, Manhattan painters are paying $1.50 for a four-ounce tube of this famous lake, which, it goes without saying, offers a surface, when artistically finished, magnificent and unique in color effects. Perhaps like the Teddy bear madder lake may exist as a fad for a little brief, but luxurious, notoriety, and then disappear into the innermost recesses of oblivion. At the present, however, it is being received with all the favor that belongs to the scion of the royal family.

As a matter of historical interest, madder lake is the product, through boiling, filtering, etc., of madder root, found in the tropical sections of the old and new world.

The base for madder lake should be about as strong and supple, and smooth and level, as the best craft skill can make it. After rubbing the surface out of roughstuff, sand it lightly with No. 0 sandpaper, dust off thoroughly, and apply a coat of Indian red ground in japan. Uusually one coat of the Indian red will suffice to develop the necessary solidity of color, but in case there should exist any lack of color density, a second coat of the red is in order of application.

Then thin some of the madder lake with a perfectly pure, water white turpentine, and apply a coat with a camel's hair brush. Then in a pint of elastic rubbing varnish stir one-half ounce of the lake, mixing until a thorough incorporation of pigment and liquid ensues. Apply with a soft, full elastic brush, flowing the glaze on freely. In due time deaden the gloss with water and No. 00 pulverized pumice stone, using a soft piece of sponge in lieu of a rubbing pad. Wash up and apply a second coat of the glaze. Stripe in lines of black or gold and finish in A 1 fashion for results.

How De Dion Fooled the Gendarmes.

Appearance is a big factor in speed persecution, as many an owner of a racy looking car has found to his sorrow. Many a family party in a big comfortable touring car has been allowed to go through speed traps at 40 miles an hour without interruption, where the driver of a low-hung, racing type runabout has been held up for going 20 miles an hour, because with the former the muffler was closed and everybody was sitting erect and happy while with the latter the driver was humped up in a little racing seat, with the steering wheel in front of his nose, looking as though he were making a last spurt for the Vanderbilt cup, or some other cup, with the muffler open.

To give a demonstration of how largely the officers of the law are affected by mere external appearances, the Marquis De Dion recently constructed a special car for the purpose. The Marquis had found that when driving a big car he was invariably accused of speed violation and as invariably fined, no matter how slowly he might drive. First building an especially long chassis, he fitted it with a 4½ horsepower De Dion motor and mounted a racing body with a long hood suggesting at least six cylinders and 100 horsepower. Then he added the largest acetylene headlights obtainable and a deep, roaring horn. Inviting a superior officer of the gendarmes to be his companion for the demonstration, he set forth in the dusk of the evening with muffler wide open and his little engine barking at a furious rate, although his rate of travel was but a crawl. With the officer of gendarmes and himself heavily begoggled and leaning forward from their cup seats, the effect was striking, and the Marquis was promptly stopped by excited gendarmes who accused him of making terrific speed and endangering human lives. His protests were in vain in the face of his huge looking car, until the superior officer disclosed his identity. The latter was impressed with the justice of De Dion's complaints and all the gendarmes were given a lecture about rashly accusing drivers of high speed just because their cars were big, or happened to possess the appearance of being designed to go only at extreme rates of speed.

Municipal Garage for St. Louis.

Increasing use of automobiles by city departments is causing many of the larger cities to consider the advisability of building and maintaining municipal garages. St. Louis is now making the venture, a garage for the cars used by the water department being in process of erection at King's Highway and Eager Road. The building will be of modern French architecture, with a white stone front, and when finished prospective garage builders wil have good reason to study it as a model. If it meets expectations in convenience and ecoonomy it is probable that the city will build more garages of the same type for housing city cars that are at present taken care of in three large buildings rented for that purpose.

Long Walk to Pay for Stolen Ride.

There has been considerable thieving around San Francisco of late and several automobiles have been missed from their accustomed places at times so it is not surprising that when Duncan Davis, of San Anselmo, missed hib big touring car, he should at once institute a thorough search for it. When he found the car five miles from where he had left it the owner compelled the four persons in it, two men and two women, to get out at the point of a pistol. Despite their protestations that "it was all a joke" Davis thought it ought to be worth a walk home, which the four "friends" were compelled to make in payment for their ride.

REAL SALESMEN THE PRESENT NEED

How the "Readjustment of the Industry" is Affecting the Personnel—Changed Conditions Demand Ability.

While the "readjustment of the industry" which is being discussed more or less just now, is destined to be widespread and lasting in its effects, safe to say its influence will in no way be more marked than in the reformation of the pensonnel of the industry, both in rank and file. A process of thorough infiltration already is in progress, and when it is finished a wonderful transformation will be apparent—a transiormation in which the prosperous and florid "automobile men" who have flourished for so long a time, will be displaced by a body of sober and industrious business men whose regard for the processes of manufacturing or selling motor cars will be no less serious than their regard for any other of the industrial and commercial pursuits.

That the need of such a renovation in the personality of the various firms connected with the industry is quite as necessary as a reformation in the methods of directing the business. has been apparent for a long time to the older and wiser heads of the industry. Just how the need is felt and how the change is proving to be in a way self-inductive, best appears from the opinions of a number of these well known and experienced authorities.

Thus speaking of the requirements essential in a motor car salesman, Windsor T. White, of the White Co., said recently: "What we want now is not automobile men, but business men. We are just coming to find out the real worth of our employes, and to discover what we ought to have known long ago—that the same qualities which we should value in a man in any other line of activity, are the qualities we require right here.

"For instance," he continued, "a man may have been on the floor of an agency selling cars for several years. In the course of his experience, he may have been able to sell machines aggregating in value no less than $100,000 a year. Generally, such a man will come to rate himself as a $100,000 man. These are the actual conditions, however.

"In the past season or two, buyers have been gathered indiscriminately, advertising and publicity campaigns have been widespread and effective and furthermore, a considerable amount of business has come into the average agency almost of itself, as you might say. In this way it has been practically impossible to determine how much of the business consummated has been due to actual salesmanship, and how much to outside influences of one sort or another.

"Conditions are changing rapidly now, however, and it is no longer so easy to sell cars. Consequently the employee who last year, let us say, under the name and salary of a first class salesman was in many cases performing the work of the plainest kind of a clerk, now has an opportunity to prove whether he possesses real selling ability. When he has to go out and make a market for his car, it may be that he will prove to be of comparatively small value in a business way.

"In other words, selling now has come to be a matter of business ability alone. The man who knows his car, who keeps well posted on what other makers are doing and what other dealers are holding out as inducements to customers, and who keeps read up in all that pertains to his line is able to get ahead. Of course, the other sort of man, the fellow who is all full of noise and bluster, but who has no actual ability, is bound to find his level also, because in the newer order of things ranking will be done solely on a basis of actual personal ability."

In the same connection, the representative of another large car manufacturing interest expressed himself in similar strain regarding factory operatives.

"Factory men should not be automobile men," was his terse way of expressing the idea. "What we want in a shop is machinists, bench and floor hands, assemblers, or whatever, but we want them to be able to do that work well and to do that work alone.

"As soon as the average mechanic gets his first smell of gasolene, he begins to think he knows all about cars and right away he begins to want to give advice to the designer and the superintendent and everybody that comes within speaking range of him. But somehow he ceases to take an interest in his own work just about the time he begins to get automobile wise. Now it takes all a man's time to become a good machinist and once he has learned his trade, it takes about all his time to keep pace with the growth of that trade. Even at that, good all around machinists are comparatively rare. In the same way, every art and craft represented in the construction of a motor car, is the development of years of specialized training, and in order to outlay the best possible workmanship on the materials we devote to the machine, we must employ the men who are the most accomplished specialists in their own line of work. The moment they begin to slop over and cultivate the automobile as a thing apart from their trade, their usefulness begins to diminish.

"Understand," he continued "I don't mean to say that a good mechanic cannot find ample use for his handicraft if he devotes himself to the construction or repairing, or even the running of cars. What I do say, though, is that the man in the shop who lets his mind wander away from his job to the place where that job is to be used after it leaves his hands, like the wheelwright who tries to teach the coachman the art of horsemanship, is looking at life the wrong way about. We have had plenty of men in the past, who thought more of the automobile than they did of their jobs. They are trouble makers, first and last and their influence always is to overthrow the discipline of the shop, even though their intentions may be of the best and their ambition most admirable."

It is fast becoming evident that too many men in the industry regard its affairs rather more in the light of the processes of a mere pastime, than as the elements of a growing and important industry. In fact the common use of the term "game" in connection with the events of its business and sport reflects a sinister light on those who use it either in thoughtlessness or in ill-concealed scorn.

It is related of one of the largest and most successful manufacturers of the middle west, that whenever an applicant for employment happens to mention the fact of his having been "in the game" for three or four years, the interview immediately is brought to an end by the manufacturer, who, rising, gruffly announces that the applicant will hear from him by mail if he shall have need of him. Somehow letters promised under those conditions never reach their destination, and likely a good many ambitious men are wondering to-day why the summons for which they have waited so eagerly never has come.

The "Johnny" Type of Salesman.

Why some concerns still persist in putting the "Johnny" type of salesman in charge of their exhibits at such important shows as were recently held in New York remains a mystery, remarks the Carriage Monthly. Dress suits and lounging ladies are not the requisites of salesmanship. Brains, and a thorough knowledge of the subject, are. One man in overalls who knows his business is worth a dozen inattentive Johnnies in dress suits trying to talk busines and carry on a flirtation at the same time. Many a firm, especially the accessory people, will go home from the New York shows wondering why they booked so few orders while their neighbors fared so well. Let them look into this "Johnny" question. Evasive answers, born of superficial knowledge, do not satisfy people who do a bit of thinking on their own account. A man who does not know his line of goods thoroughly has no place at an automobile exhibition where people come to get information, and the sooner all firms reduce this show proposition to a strict business basis, eliminating all attempts at making it a social affair, and selecting their representatives for their brains and not for their looks, the better it will be for the industry and for themselves. In this respect the motor industry could get a pointer or two from the business-like conduct of carriage exhibitions. Why should not the motor car business be conducted like any other business? Who started all this nonsense anyway?

EMULSION FOR ROAD SPRINKLING

Results Reported from Use of Oil and Soapsuds on Boston's Park Roads—Its Efficiency and Economy.

On the same emulsion principle with which its cod liver oil is made endurable to human palates, Boston has been coating oil with soapsuds for its parkway roads, and the roads have thrived on the treatment, according to John A. Pettigrew, the superintendent of parks. Pettigrew's problem is to keep down the dust nuisance and last year his department tried adding a dash of oil to the water sprinkled by the cars on some twelve miles of the park roadways. The roads thus treated showed very good results and needed the sprinkling cars very infrequently compared with those on which plain water was used. This year the experiment was carried to the whole park system of roads, about forty-two miles, and the figures show remarkable economy over the use of water alone, with an incidental benefit to the roads that greatly lessens their repair charges and makes them better for traffic.

Before trying the oil mixture, the department used to spend as high as $883 per mile of 30-foot roadway for 230 days of watering on some parts of the system while on others the cost was as low as $489 per mile for 182 days of watering, making an average of about $680 per mile each season. Shorter hours of labor and higher team hire would make the same service cost more at the present time, but with the oil emulsion the cost of keeping the dust down even more effectively is only about $352 per mile for the season, or about 2 cents per square yard.

By combining it with soapsuds and water, the oil is applied without annoyance to the users of the road, and carriages may follow immediately after the distributing sprinklers without being soiled. The emulsion helps the oil percolate and penetrate into the road material instead of remaining on the surface in unabsorbed pools. The first application of the season contains about 16 per cent. of oil, to form a basis, while subsequent accretions of dust blown on the roadway from other sources or present by attrition of the road itself, are taken care of by occasional applications of thinner emulsions, containing from 8 to 10 per cent. of oil. These renewals are made in periods ranging from ten to twenty-five days, according to the nature and traffic of the road.

The emulsion is made by a formula which requires 10 to 15 pounds of cottonseed oil soap, at 4½ cents a pound, to 100 gallons of Texas petroleum, at 6½ cents a gallon, the soap being first dissolved in 50 gallons of water. The soap is placed in barrels of water and dissolved by steam heat, then pumped into stock reservoirs, which are simply street sprinkling wagons. To each barrel of soap and water two barrels of petroleum are added. A steam pump is then attached to the tank containing the mixture and the contents agitated until emulsified. This forms an emulsion "stock" containing 66 per cent. of petroleum, and the "stock" is later diluted to the oil percentage required. When a sprinkling wagon is to be sent over a portion of road, its tank is first partly filled with "stock" and when the wagon arrives at the portion of road to be treated, a street hydrant is used to fill the balance of the tank with water, the latter readily mixing with the emulsion and thinning it to the percentage necessary for effective use.

Not only does the use of the oil mixture lessen the required frequency of trips by the sprinkling wagons, but it permits the laying up of the road rollers after the middle of August. The asphaltum in the Texas oil has a binding effect on the surface of the road, and less road repair is necessary.

In the course of its road study the department has come to favor a thin rolling cushion of coarse sand or fine screenings, saturated with oil, although it is hard to maintain on curved roads where the swing of vehicle wheels tends to throw it to the outer side of the curve. Such a cushion, being loose and rolling, is thought to release the air suction underneath the tires of rapidly moving automobiles which is declared to be so destructive to the road binder. When fine sand is used there is a possibility that frequent oil applications will form it into a hard asphaltum surface which has a tendency to scale.

White Adds to "Route Book" Series.

The White Company have just issued the "White Route Book Number Five." It gives the detailed road directions for over 1,500 miles of the main highways, suitable for tourists, in New York State and in the Province of Quebec. The routes given include those in both directions between New York and Albany and in both directions between Albany and Buffalo. In addition, directions are given for the route northward from Albany to Saratoga, and thence by way of Elizabeth to Plattsburg and Rouse's Point to Montreal. From the latter city the route is given along the north bank of the St. Lawrence to Quebec. Still another route is that by way of Tuxedo and Central Valley to Newburgh. The new route book, like the four numbers which have preceded it, is profusely illustrated and contains a double-page map of the section of the country covered, as well as an article descriptive of the route. Like all other of the White route books, the new volume is designed for gratuitous distribution.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

CHAIN PROTECTED TIRES BARRED

New City Ordinance Excludes Them from Park Roads and Parkways—Police Guard Entrances and Avenues.

It now is illegal for an automobile with chains on the tires to enter any of the public parks in Greater New York or travel upon any of the roads that are under the jurisdiction of the Park Department. The ordinance prohibiting it was adopted at the request of that department and went into effect on Monday, 16th inst. Following is the body of the ordinance:

"No automobile or horseless or other vehicle, wearing chains over the tires of their wheels shall enter the public parks or the traffic roads under the jurisdiction of the Board of Parks, without permission of the commissioner having jurisdiction. This rule and regulation shall take effect December 16th, 1907."

The highways under the jurisdiction of the Park Department, which are covered by this ordinance are as follows:

Manhattan — Central Park, Riverside Drive, Morningside avenue west.

Brooklyn—All macadam roads, such as the drives in Prospect Park, Eastern Parkway, Ocean Boulevard, Shore road, Bushwick avenue from Eastern Parkway to the extension of Jamaica avenue, etc.

Bronx—Spuyten Duyvil Parkway, Rockwood Drive in Van Cortlandt Park, Van Cortlandt Park avenue in Van Cortlandt Park, Pelham avenue in Bronx Park, Eastern Boulevard in Pelham Bay Park, City Island road in Pelham Bay Park, Crotona avenue in Crotona Park, Mosholu avenue in Van Cortlandt Park, Gun Hill road, in Van Cortlandt Park, Masholu Parkway, Bronx and Pelham Parkway, Shore road in Pelham Bay Park, Crotona Parkway.

One of the effects of the new rule is that for certain journeys it will be illegal to have chains on the tires when traversing the roads out of the city. On the trip from New York to Boston, for instance, chains may not be put on the wheels until Pelham Parkway is left behind. Non-skidding tires of the studded or armored type are not barred under the ordinance.

Enforcement of the rule was begun with vigor early Monday morning and automobilists who arrived at any of the entrances to Central Park found there one or two policemen, while at the main entrances at the Circle and the Plaza mounted patrolmen were on duty to turn back any automobile equipped with non-skidding chains. About three-fourths of the automobiles arriving at the park during the day were denied admission on that account. There was no relaxation of police vigilance in the evening.

Similar conditions prevailed at Bronx and Van Cortlandt parks and at Prospect Park in Brooklyn.

The Week's Patents.

865,288. Tread for Pneumatic Tires. Erle K. Baker and Charles G. Hawley, Chicago, Ill. Filed May 16, 1907. Serial No. 374,059.

1. A resilient tire for vehicles, having a tread portion containing an interference strip of fabric, vulcanized therein, and also containing a large number of staple like metallic parts having closed, rounded ends in substantial contact with said interference strip and presenting their ends at the surface of said tread portion, substantially as and for the purpose specified.

865,302. Clutch Mechanism. Bengt M. W. Hanson, Hartford, Conn., assignor to Pratt & Whitney Company, Hartford, Conn., a Corporation of New Jersey. Filed Aug. 9, 1905. Serial No. 273,477.

1. The combination, with framework, of a sleeve bearing projecting therefrom; a tubular driving shaft mounted in said sleeve bearing, and having a chambered head; a clutch plunger having a transverse slot mounted in the chamber of the head; a spring for throwing said clutch plunger in one direction; a rod movable in the bore of the driving shaft, and having its end shaped to enter said transverse slot, and actuate the clutch plunger against the stress of the spring; a power transmitting sleeve surrounding the driving shaft and its chambered head; and a complemental clutch element carried by said sleeve.

865,306. Means for Securing Soft-Tread Tires to Rims. Frank M. Hilton, John S. Hilton, and William W. Hilton, Akron, Ohio, assignors of one-half to Harvey Musser, Akron, Ohio. Filed May 12, 1906. Serial No. 316,563.

1. In a vehicle wheel, the combination of a rim provided at one side with a confining flange, a lock ring slipped upon the opposite side of the rim and having a corresponding confining flange, a split spring annular binder fitted to the rim and adapted to prevent outward displacement of the lock ring, and a keeper at one end of the binder having an opening therein to receive the opposite end of the said binder and having a slot in its side to provide ingress and egress to the said opposite end of the binder.

865,315. Lubricant Feeding and Distributing Mechanism. William E. Parr, Madison, Wis., assignor to The Madison Kipp Lubricator Company, Madison, Wis., a Corporation of Wisconsin. Filed March 13, 1905. Serial No. 249,849.

1. In a lubricating mechanism, the combination of the lubricant receptacle, a pump fitted therein and having its cylinder secured to the inner face of one of the walls of the casing of the receptacle, a distributer, also secured to the inner face of one of the walls of the receptacle, and having a lubricant chamber, connections between the pump and the distributor arranger outside the receptacle and extending through the walls thereof to make connections with the said parts respectively, means for operating the pump arranged with the receptacle, and a valve within the lubricant chamber of the distributor also operated from within the receptacle, substantially as set forth.

865,338. Power Yielding and Receiving Means. Ford W. Harris, Winkinsburg, Pa. Original application filed Feb. 19, 1906, Serial No. 301,956. Divided and this application filed July 16, 1906. Serial No. 326,475.

1. The combination with an engine cylinder, a piston, and a valve, that governs the admission of fluid to the cylinder of means for causing the travel of the valve to be independent upon the speed of the piston, passages that communicate, respectively, on opposite sides of the passages, and means that govern communication thereof with the passages.

865,384. Timer. Charles S. Hardy, Summit, N. J. Filed Jan. 21, 1907. Serial No. 353,248.

1. In a timer, the combination with a contact; of a member, normally operatively rotatable in a single continuous direction, on which member said contact is supported; a second contact; means for supporting the second contact directly in the path of movement of the first contact, whereby the two contacts engage directly with each other; and means for permitting a yielding movement of one contact with respect to the other, in a direction substantially in line with the path of movement of the contact which is supported on the rotatable member, at the time of contact making impact.

A. Marien, St. Louis, Mo. Filed Aug. 27, 1906. Serial No. 332,125.

1. The combination with the rim of a wheel, of a tire of resilient material seated on said rim, cross bars passing through tire, annular members of rigid material engaging the ends of said bars, and retaining plates removably secured to said rim and locking said annular members against radial movement.

865,443. Tire Shield. Thomas J. Sprinkle, Hillsboro, Ohio. Filed Sept. 10, 1906. Serial No. 334,013.

1. In combination with a tire, a shield, wires embedded therein and extending longitudinally of the shield and lying upon opposite sides of the longitudinal axis thereof, said wires being volute with one of the volutions embedded in the material at the edge of the shield and the other volution embedded in the material in the vicinity of the middle thereof.

865,449. Clutch Device Power Transmitting Mechanism. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine. Filed Jan. 21, 1907. Serial No. 353,338.

1. In a power transmitting mechanism, the combination with a driving and driven parts, of a plurality of nested clutch devices, and suitable gearing connections whereby different speeds may be imparted to the said driven part from the said driving part through said clutch devices.

865,650. Valve and Sparking Mechanism for Hydrocarbon Engines. Levi E. Lowe, Columbus, Ohio. Filed Dec. 3, 1906. Serial No. 346,027.

In a device of the character described, the combination with the cylinder of an explosive engine, of an outlet valve comprising a valve stem and a valve head, a casing in which said valve is mounted, an oscillatory arm located upon one side of said valve, a contact point located upon the opposite side of said valve, and a curved finger carried by and movable with the oscillatory arm which extends around the valve head and is provided upon its free end with a contact point adapted to contact with the first named contact point, said contact points being located in the path of gas flow past the valve head, and said valvehead being so shaped as to direct a portion of the gas flow against the contact points, said valve head lying within the curved portion of the finger.

865,662. Igniter System. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed May 11, 1906. Serial No. 316,258.

1. In an ignition system, a rotating cam, a finger moving against a fixed contact and arranged to be abruptly moved by said cam, an additional blade or finger in the path of said cam, and a single switch element for directing the primary current into both of said fingers.

865,663. Ignition System for Explosion Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed Oct. 8, 1906. Serial No. 337,871.

1. In an ignition system for explosion engines, a pair of vibrators, and a single means for positively impelling both of said vibrators to respectively open and close separate circuits.

865,666. Driving Clutch for Automobiles. Charles Wendorff, Chicago, Ill. Filed March 4, 1907. Serial No. 360,367.

1. In a power driven vehicle in combination with the axle and the wheel journaled on the axle, an outer annular clutch element rigid with the hub; an inner clutch element consisting of a plurality of parts, each adapted for seating outwardly against the inner surface of the outer annular element; a collar fast on the shaft within the inner clutch elements; plungers lodged for radial movement in the said inner clutch elements; springs reacting between said plungers and said inner clutch elements for holding the latter yieldingly outward relatively to the plungers, the plungers having at their inner ends oppositely sloping shoulders and the collar having correspondingly oppositely sloping shoulders for co-operating with the plungers respectively.

865,682. Wheel. Herman Cramer, Sonora, Cal., assignor to Cramer Wheel Company, San Francisco, Cal., a Corporation of California. Filed Feb. 12, 1905, Serial No. 245,476. Renewed May 21, 1907. Serial No. 374,846.

1. In a wheel, the combination with a spoke, and with the tire, of a casting in which the spoke is secured, a mass of rubber in said casting, and projecting beyond it, and projection secured to the tire and embedded in said rubber.

865,698. Rubber Vehicle Tire. John J. Hendler, Chicago, Ill., assignor to Tiger Tire Company, a Corporation of New York. Filed Sept. 20, 1905. Serial No. 279,220.

1. The combination with a vehicle wheel provided with a channeled rim, of a tire comprising an outer sheath of the clincher type adapted to said rim, a sealed inner tube provided with one or more inflating inlets and a filling of cellular cellulose compacted within said inner tube, substantially as described.

865,699. Rubber Vehicle Tire. John J. Hendler, Chicago, Ill., assignor to Tiger Tire Company, a Corporation of New York. Filed Sept. 20, 1905. Serial No. 279,221.

1. As a new article of manufacture, a vehicle tire of tubular form provided internally with a distributing tube perforated at intervals throughout its length, a filling of granulated cornstalk cellulose having the capacity to expand forcibly when moistened, interposed between the distributing tube and the exterior tube, and an inlet communicating with said distributing tube and extending out to the exterior of the tire.

865,743. Tire, William T. Wood, Nashville, Tenn. Filed Sept. 19, 1906. Serial No. 335,326.

1. A tire comprising a tubular casing, and a plurality of separate yielding supports located one behind the other within and connecting the inner and outer portions of the casing, said supports having separate lateral webs connected to the sides of the casing.

865,755. Self Igniter. Richard E. Berthold, New York, N. Y., assignor of one-half to William F. Holcombe, New York, N. Y. Filed March 28, 1907. Serial No. 365,137.

1. A self igniter, comprising a combustion chamber, an independent chamber or case attached thereto at the side thereof, means for retaining a combustible vapor producing medium in said combustion chamber, a material capable of catalytic action when brought in contact with said vapor, normally retained in said independent chamber or case, a removable closure for said combustion chamber and said case adapted to simultaneously close the combustion chamber and said case, said case closure supporting the material capable of catalytic action.

865,765. Wheel for Road Vehicles. Joseph Davies, Birmingham, England. Filed Aug. 25, 1906. Serial No. 332,059.

1. In a vehicle wheel, an outer metal tire or tread, a resilient tubular seating on which said tire is mounted, an auxiliary tire carrying said seating and an elastic cushion interposed between said auxiliary tire and the felly substantially as set forth.

865,767. Apparatus for Supplying Explosive Engines with Explosive Mixture. Charles G. Dean, Indianapolis, Ind. Filed July 28, 1906. Serial No. 328,208.

1. A vaporizer including a vaporizer body having an air chamber in one end and a valve seat in the opposite portion thereof, a valve spring pressed to the seat, there being an oil chamber about the valve between the seat an the air chamber, the vaporized body having two open passages therein between the air chamber and the oil chamber and an oil supply duct leading to one of the passages, and a check valve normally closing the oil supply duct to be opened for admitting oil to the oil chamber.

865,804. Rotary Engine. Samuel S. Sadorus, Sarilda, Idaho. Filed April 19, 1907. Serial No. 369,124.

1. The improvement in rotary engines herein described, comprising the piston and its shaft, a casing having a lateral wing and an inlet, a cover plate fitting over said wing, a cut-off valve turning between said cover plate and wing, and having openings movable into and out of register with the inlet, whereby to admit and cut-off steam, a shaft for operating said cut-off valve and gearing between the said shaft and the piston shaft, substantially as set forth.

865,851. Vehicle Carpet Holding Spring. Daniel F. Armstrong, Mallorytown, Ontario, Canada. Filed Nov. 30, 1906. Serial No. 345,832.

In a vehicle body and in combination with the sills thereof, of spring carpet holders secured to said sills, and having their points or portions of their bodies bent downwardly so as to impinge upon the carpet, substantially as described.

865,891. Rotary Engine. Ralph H. Heberling and William L. Heberling, Havana, Ill. Filed Oct. 25, 1906. Serial No. 340,528.

1. In a rotary engine, the combination with a rotary cylinder, of a rotary disc within the same, and connected to said cylinder so as to rotate therewith, said rotary disc having extending therefrom and rigid therewith a shaft forming an axis of said disc and which shaft is inclined relative to the axis of rotation of said cylinder.

865,901. Automobile. Evan Hyslin, Kindred, N. D. Filed April 9, 1907. Serial No. 367,182.

1. In a running gear, the combination with sectional axles and their casings, of a tubular reach casing connecting said casings at the middle and joined at its ends by vertical pivots thereto, a drive shaft extending through the reach casing and geared at the ends to the axles, and steering connections between the axle casings.

The Miller Speedmeter

The Miller Speedmeter is the simplest and most compact, durable and accurate speedmeter on the market. It works on the principle of centrifugal force. The entire governor mechanism is constructed from tool steel. It is arranged for adjusting the tension of springs at all speeds, and with this special constructed governor and spring adjustment, the springs are made and adjusted to show all speeds with absolute accuracy.

Rate of Speed—We wish to call particular attention to the fact that the Miller Speedmeter will register correctly at a low rate of speed, and the hand does not bob around or fluctuate when running at slow speed.

Flexible Shaft—The flexible shaft used in this instrument is made from tool steel and each link hardened separately before assembling. The cost of this shaft is more than four times that of the wire shafts generally used.

Driving Gears—The Miller Speedmeter is fitted with crown gears with an universal attachment, which permits of the instruments being attached to any style of car on the market.

Distance Traveled—The Miller Speedmeter is fitted with an odometer, which registers the distance traveled in miles, and has total and trip dials.

Finish—The material, workmanship and finish of the Miller Speedmeter is not excelled, if equalled, by any other speed indicator on the market. Each instrument is carefully tested on a special constructed testing machine before leaving the factory, and

Is Guaranteed for One Year.—The price of the Miller Speedmeter complete, including odometer, with dial registering 60 miles per hour, $50.00.

AGENTS WANTED EVERYWHERE—We give a large discount to manufacturers, jobbers, agents and dealers in automobile supplies.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

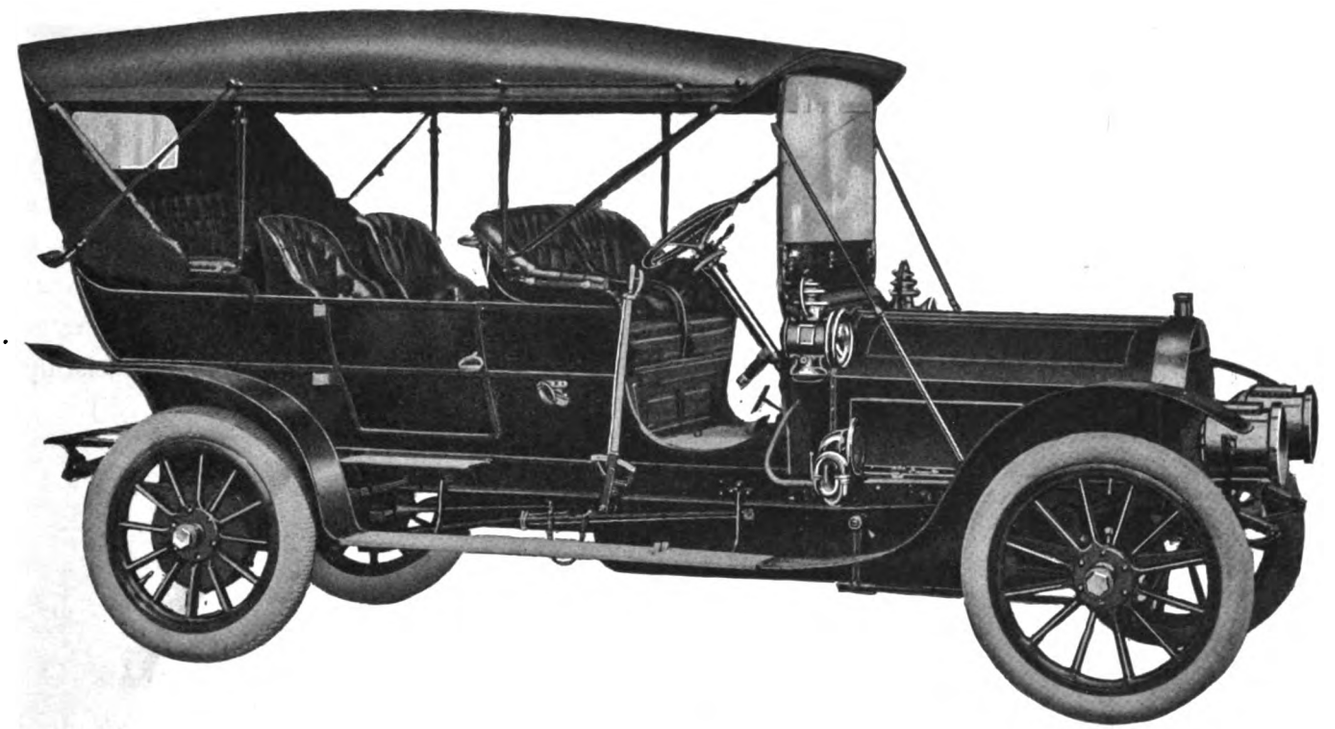
"WHITNEY" CHAINS

January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

Patented



"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows:

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

THE WHITNEY MFG. CO., - Hartford, Conn.

NEVER MIND WHAT THE OTHER FELLOW SAYS

The Tire of the Day

There is a vast difference between 1908 G & J tires and those said to be "just as good." Don't let someone else select your tire equipment by telling you that some other make is just as good or better than G & J, but make your own comparisons—use your own judgment and insist upon getting the *BEST* tires—the kind you want—G & J.

It will be well also to select the improved 1908 Universal Midgley rims which fit any make of Clincher or Dunlop tire.

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Speciai

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exigencies of street traffic without any changing of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

COLT'S CRIB SHOWS POVERTY

Brief and Breezy Career of the Company Leads to a Receivership—Alleged Transfers to Favored Creditors.

After a short and more or less merry life, the Colt Runabout Co. is now en route to the retirement of a stall in the bankruptcy stable.

Following the filing of a petition by the Frank Presbry Co., Robert Bosch, New York, Inc., and the Reliable Radiator Co., whose claims amount to $1,300, $400 and $174, respectively, Harry Osterman was appointed receiver for the concern on Monday last, 23d, inst. It is alleged that during the past three weeks the company has transferred to certain creditors practically all save about $500 worth of its property.

The Colt Runabout Co., which had an assembling plant in Yonkers, N. Y., and a store at 1876 Broadway, New York City, was incorporated in June last with capital stock of $10,000, which amount was increased to $50,000 on August 30th. William Turner was its president. The company early acquired a press agent and he made it appear that the Colt four cylinder runabout—which was chiefly an assembled car—was selling like hot cakes and that its low price was worrying every other manufacturer in the industry. It is known that at least two cars actually were produced.

Cleveland Changes Its Policy.

The Cleveland Motor Car Co has decided to dispense with agents and to market its product entirely through its own branches, three of which—New York Philadelphia and Chicago—already are in existence; other stores will be established in the other populous centers. Official announcement of this radical change of policy was made this week. The price of the Cleveland car has been reduced to $3,500, which price the makers say is rendered possible by the elimination of middlemen. They add that their decision to deal direct with the public was also influenced by the fact that they will build but 300 cars for the 1908 season, which number they think their own branches readily can dispose of.

To Build Buicks in Canada.

The McLaughlin Carriage Co., of Oshawa, Ont., which had intended to build an automobile of its own design. has changed its mind and completed a deal with the Buick Motor Co. to reproduce the Buick cars in Canada. To further the enterprise a separate company, the McLaughlin Motor Car Co., capitalized at $500,000, has been organized and incorporated to carry on the automobile end of the business. The McLaughlin Carriage Co. probably is the oldest and largest carriage concern in the Dominion, and its entry into the automobile industry is therefore in the nature of an event.

Spokane Sees a Factory Coming.

From Spokane, Wash., comes the apparently trustworthy report that N. C. Gauntt has arranged for the removal of an automobile factory—name not stated—from South Bend, Ind., to Spokane. The leading car that will be built will be one of 70 horsepower with six cylinders. The first of Gauntt's cars will be made in South Bend in January as the Spokane plant, the machinery for which is said to have been purchased, will not be in operation until next summer, at which time Spokane will celebrate as befits the occasion. Gauntt's identity or previous connection is not disclosed.

Hartford Merges Two New York Branches.

The Hartford Rubber Works Co.'s New York branch at 88 Chambers street, will be discontinued on January 1st, and thereafter the business will be concentrated in the uptown branch, which for several years has been located at Fifty-seventh street and Broadway. The Hartford company's downtown agency will now repose wholly with Charles E. Miller at 97 Reade street, who is well qualified to take care of it

DE DION SEEKS AMERICAN SITE

Several Cities Said to Have Offered Inducements—Albany Has Visions of an Addition to Her Factories.

Although it seems rather late in the day for a move of the sort, there are indications that the famous De Dion-Bouton Co. are seriously "prospecting" for a site for an American factory.

Accompanied by the statement that several cities already had offered inducements, the first definite news that the French manufacturers are seeking an American location came from Albany, N. Y., following a visit to that city of Count Manuel de Caserta, who is said to be De Dion's American representative, and Russell Hopkins, of Irvington-on-Hudson, who is consul for Panama and who is described as a financier. During their visit "up-State" they were guided by the industrial agent and other officials of the Delaware & Hudson Railroad, who pointed out several favorable factory sites and introduced the visitors to a number of Albany's leading business men, who in turn impressed them with the commercial advantages of that city.

The count did not commit himself in any way, but let it be known that the De Dion people are not seeking a bonus and also that no decision will be made until the American company, which is in prospect, is organized, and which, it is said, will be floated with French capital, although Americans will not be denied an opportunity to invest.

In Albany the impression was created that the DeDion works in France are overwhelmed with orders, many of them from America, and that an American factory employing about 3,000 men is desired to relieve the pressure, which impression does not exactly agree with other reports from abroad. The idea was also created that if a plant is located here, omnibuses and commercial vehicles will constitute its chief output.

THE WEEK'S INCORPORATIONS.

Cincinnati, Ohio—Watkins Motor Works Co., under Ohio laws, with $10,000 capital. Corporators—Frank M. Watkins, W. C. Tunks, W. A. Watkins, F. C. Watkins, W. J. Davidson.

Dover, Del.—American Motordrome, Inc., under Delaware laws, with $500,000 capital. Corporators—F. Franklin Lamon, Philadelphia; George H. B. Martin, S. C. Seymour, Camden, N. J.

Dover, Del.—Mexico City Motor Cab & Omnibus Co., under Delaware laws, with $50,000 capital. Corporators—J. F. Mosby, New York City; A. A. Kelsey, Montclair, N. J.; J. Virdin, Dover.

Brockton, Mass.—W. H. Marble Automobile Co., under Massachusetts laws, with $50,000 capital; to deal in automobiles. Corporators—B. A. Hastings, president; W. H. Marble, treasurer, both of Brockton.

Rochester, N. Y.—Union Motor Car Co., The, under New York laws, with $15,000 capital; to manufacture automobiles and parts. Corporators—Edward C. White, Victor L. Kraft and A. Vernon Hart.

New York City, N. Y.—Cities Motor Cab Co., under New York laws, with $100,000 capital; to operate motor cars for hire. Corporators—J. B. Sabin, C. O. Bartwig, A. Czerweng, E. K. Heal, New York City; G. A. Denig, Upper Montclair, N. J.

New York City, N. Y.—Salvini Auto Horn & Tubing Co., under New York laws, with $30,000 capital. Corporators—Salvatore Salvini, 402 East 116th street; Giuseppe Brunelli, 235 East 114th street; Andrew Casazza, 13 Roosevelt street, New York City.

Oakland, Cal.—National Marine Water Autodrumbile Co., under California laws, with $500,000 capital; to make land and water automobiles. Corporators—Charles F. Hilden, Axel Gundersen, John J. Swensen, Herman Hansen, Victor Thoren, and Hans Johansen, San Francisco.

Prest-O-Lite Again Visited by Fire.

For the second time within six months the plant of the Prest-O-Lite Company, at East and Pearl streets, Indianapolis, Ind., was partially destroyed by fire and explosion Friday afternoon last, 20th inst. The entire loss is estimated at about $20,000. The exact cause of the explosion which started the fire is not known, but the deduction is that a spark from a buffing machine ignited escaping gas from a nearby filling machine. It is fortunate that the company had partially moved its plant to the new factory in South street, and therefore had only a few men working in the building at the time, else the loss of life must have been great. One man, Elmer Jessup, employed at the buffer, received burns from which he died the following day. A similar fire occurred at the plant on August 17th last, when the loss of $50,000. At that time 2,900 charged gas tanks were in the building, while last week there could not have been more than 200 or 300, as much of the material had been removed to the new factory.

Shock Absorber for Runabouts.

To meet the demand of manufacturers and owners of light powered runabouts, the Hartford-Suspension Co., New York, makers of the Truffault-Hartford shock absorber, have perfected what will be known as the "Truffault-Hartford Junior." This device is smaller than the two models which this concern has been manufacturing for several years and will sell for $25. It is intended to be fitted to such runabouts as the Ford, Maxwell, Mitchell, Reo, Atlas, Cadillac, etc. The company is now making three models catalogued at $25, $40 and $50, and with the addition of the "Junior," any size car can be equipped with this well known device. The "Junior" has all the essential features of the larger type and the only difference in its makeup is the size.

Incorporated to Produce Autodrumbiles.

The effect of the appearance in New York City some time ago of an amphibious automobile doubtless has been felt as far away as California. The National Marine Water Autodrumbile Company was incorporated at Oakland last week by several San Franciscoans. The company is capitalized at $500,000, of which sum $4,800 has been subscribed. Whether the Swedish government is interested in the venture or not is not stated, but it is certain some of Scandinavia has put up its hard earned coin, as evidenced in the names of the following incorporators: Charles F. Hilden, Axel Gundersen, John Swensen, Herman Hansen, Victor Thoren and Hans Johansen. The company will manufacture, it is stated, "autodrumbiles, which are automobiles equipped to navigate through streams of water as well as through muddy roads."

Appraisers for Electric Vehicle.

By designation of the court, Fred C. Billings and John R. Hills, of Hartford, have been appointed appraisers of the Electric Vehicle Co.'s property in the State of Connecticut. Messrs. Billings and Hills performed similar service for the Pope Mfg. Co.'s receivers.

Franklin's New Chicago Manager.

A. O. Hunter has been appointed manager of the Chicago branch of the Franklin Automobile Company. Previously, Hunter was head instructor of salesmen for the National Cash Register Co., with headquarters at Dayton, Ohio.

Mundy Sets up for Himself.

Harry H. Mundy, formerly of the Miller-Mundy Co. and the Utica Motor Car Co., Utica, N. Y., has set up in his own name as a dealer and jobber of accessories. He has located in the Utica City National Bank building.

IN THE RETAIL WORLD.

Woodward & Johnson have opened a garage at Arlington, Cal. A full line of supplies will be carried.

Fire damaged the garage of the Owen H. Fay Co., 243 Michigan avenue, Chicago, Saturday morning last, 21st inst. The loss is not stated.

P. L. Balentine will erect a two-story brick garage, 17x70 feet, at the southeast corner of McKean and Bancroft streets, Philadelphia. The cost, it is estimated, will be $2,000.

The Iowa Automobile Co, Des Moines, has plans for a new garage under consideration. The company has taken on three new lines—the Locomobile, the Autocar and the Thomas Flyer.

The West-Stillman Motor Car Co., of Philadelphia, has reorganized with Ed. W. Meers, president and general manager; Erwin West, secretary and treasurer, and H. B. Stillman, sales manager.

The Akron Garage Co., Akron, formally opened its new commodious garage on East Buchtel avenue, last week. The company will handle the Winton, Franklin, Premier, Oldsmobile and Baker electric.

Harry Windle and W. H. Nickerson have purchased the garage and business of George J. Donahue, at Brockton, Mass. They will take possession at once and conduct the place in connection with their Montello garage.

Lester C. Taurot and Herbert L. Abrams, Jr., doing business as the Larchmont Automobile Co., at Larchmont, N. Y., have filed a petition in bankruptcy. They give their liabilities as $2,268, and assets $341, in stock, fixtures and accounts.

W. R. Sherin, Arthur F. Borges and E. Wohlgemuth, all of Milwaukee, have associated themselves as the W. R. Sherin Co., and will open at 143 Eighth street, that city. Repair work will be taken but painting automobiles will constitute the chief work of the firm.

Bert Fuller, one of Salt Lake City's best known race drivers, and Carl Redman, have purchased the Wasatch Automobile Co., 57 Market street, that city. The company formerly was known as the Utah Automobile Company, but changed its name some time ago when A. E. Hyde, Jr., bought the business from Leroy Snow, who was at that time the owner.

In keeping with the general growth manifested in the automobile trade in Los Angeles, is the latest move of the Maxwell-Briscoe-Wilcox Co., agents for the Maxwell cars. The company broke ground last Monday for the biggest enterprise yet undertaken by a Los Angeles automobile company. The new building to be erected at Pico and Main will be the largest of its kind in California, it is claimed. It will measure 65x200 feet, containing available floor space to the extent of 13,000 square feet.

REEVES ON CONDITIONS ABROAD

Despite Overproduction in Europe He Sees an Opening for America—Foreign Views of Shows and Races.

With eyes commissioned to see things for the manufacturers composing the membership of the American Motor Car Manufacturers' Association of which he is general manager, Alfred Reeves, after a seven weeks' trip in Europe, during which he viewed the Paris and London shows and peeked into some famous foreign factories, is home again with a complete stock of assorted observations and impressions as to conditions abroad. Reeves arrived last Saturday morning on the Kaiserin Auguste Victoria, but did not make his official appearance at his office until Monday morning, when he found his desk piled high with placards and garnishments hailing his return.

"Paris and London both presented wonderful shows," said Reeves. "and made it very plain that enough cars are being made to fill the European market to overflowing. There is no hungry waiting for American cars over there, but on the contrary, many of the European makers are looking longingly toward America with the idea of getting a fresh hold over here by making cuts in their prices that will put their cars in about the same figure as the corresponding American cars sell for.

"It is not to be thought, however," he continued, "that American cars cannot be sold abroad, because they can be. There are a number of American cars that would fill niches in the European market that the foreign makers are not equipped to provide for. Particularly is this the case with the dow priced cars. While most of the makers of the big cars are now also showing low powered cars as well, in the majority of cases they are not prepared to make them as cheaply and in such numbers as some of the American factories. The Germans are making the small low priced car their specialty and will offer the greatest competition in that field. In the big cars Italy is outdoing France. Between Germany and Italy, the former making small cars and the latter big ones, French makers are being hard pressed. They are fluttering about trying to make both and do not quite know where they now stand. English makers are turning out some splendid cars and in such a variety of types and prices as to greatly lessen the importation of cars either from the Continent or America.

"To sell American cars abroad requires a most careful study of conditions and a certain degree of adaptation to European methods. Whatever prejudice may exist against American automobiles is offset by the fact that through a familiarity with American shoes, cash registers and other goods, the public has been educated to a belief that American facilities for large quantity production are unequalled, and that, having learned many engineering lessons from Europe, we may be able to make cars to better advantage than the European makers.

"Whatever truth there may be in this view," Reeves went on, "is counterbalanced in the case of the large cars by the cheapness of labor. In some of the Italian factories in the mountains I saw women tending grinders and automatic machinery with all the skill of expert machinists for 60 cents a day or less, and the pay of the men is correspondingly low.

"Motor taxicabs appear to be quite a success," Reeves continued. "In Paris there are about 3,000 of them and the way they shoot through the streets would make your hair curl. A ride in one leaves you frightened and agitated the rest of the day. So far the managers think they are making money but in many cases it is very doubtful as the item of depreciation has received little attention. The motor buses have lost money, and it is not to be wondered at considering the slapdash fashion in which they are operated. Privately owned commercial vehicles are enjoying great popularity, and are being used to a much greater extent than on this side. There are all types, from light milliners' delivery wagons to heavy rigs for iron castings and coal. Except on the latter class of vehicles Paris has gone crazy over pneumatic tires. Horse-drawn vehicles and all vehicles use them.

"Shows are a vexed question in both France and England. In spite of all the discussion, however, the majority of the manufacturers agree that shows are necessary, but that the expense to the individual exhibitors must be reduced. When one sees the extravagance in the electrical displays and in the decorations at the different stands, it is easy to understand where it will be possible to reduce the cost for the future. In Paris all the streets approaching the Grand Palais were festooned for blocks with electric lights, not merely in strings, but whole trees full of them. At some of the stands the arches and signs for a single exhibitor must have cost over $5,000. This will probably all be done away with at future shows, and the American plan of having uniform decorations for the exhibitors adopted. The expensive outside decorations and electrical displays will also probably be abolished out of consideration for the exhibitors' pocketbooks.

"All the French makers want as many races as possible. Because of the number and variety of competitions last year nearly all of the exhibitors at the Paris show were able to placard their machines as winners of some kind. The Italians, too want plenty of racing, as it has been their racing triumphs that has brought them to the front. Many of them who are looking forward to having America take their surplus of cars, want to win a Vanderbilt cup race or make a good showing in Florida, and it is therefore probable that a great many foreign racing cars will be seen over here during 1908.

"Quite as much as in showing me what conditions are in Europe," continued Reeves, "my trip was valuable to me in disclosing what the conditions are not. The foreign makers are capable of supplying cars far in excess of the European demand and are in most instances looking for export outlets with more eagerness than are the American makers. Whatever American cars find any considerable favor on the other side are aided either by exceptional merit for the price, or peculiarly clever sales management. I feel that there are many things that we can learn from Europe and many more that Europe could learn from American practice, but that, in the words of a recently returned New York politician, it is a case of 'Hurray for us.'"

On the same boat with Reeves three other prominent American automobile tradesmen returned from similar missions on their own account. These were Walter C. White, of the White Co., of Cleveland; Howard E. Coffin, chief engineer of the Marmon Co. of Indianapolis, and a member of the A. M. C. M. A. technical committee; and Howard C. Coflin, chief engineer of the E. R. Thomas Motor Co. and the Thomas Detroit Co. Some of them dealt with the foreign situation far less gently and diplomatically than did Reeves, and indicated that conditions abroad, so far as the sale of automobiles is concerned, are distinctly bad, so bad, in fact, that the American situation is one of prosperity compared with it. According to their observations the foreign makers are "up against it," and do not know which way to turn. Their factories are in many cases running at only a fraction of their capacity and their unsold cars glut the salesrooms.

Coffin paid considerable attention to the engineering progress in evidence at the shows and elsewhere. He was particularly impressed with the Olympia show in London.

"In many respects," he said, "the Olympia show was more interesting than the Paris exhibition in its display of engineering advance and refinement. Many of the English makers are evincing a daring and originality that is quite refreshing, making it plain that automobile engineering has not as yet settled into a rut."

The White being one of the few American cars to have made already an indelible mark on the foreign markets, Walter White was pleased with the results of his observations.

"Although there is undoubtedly an oversupply of certain types of cars in the European market," he said, "the business in White steamers has been unaffected. We are constantly developing our foreign organizations and have recently opened additional branch houses in Edinburgh and Manchester."

country an outlet or dumping ground for foreign built cars.

The boasted American faculty for factory management and large production on the interchangeable system is taken by the export enthusiasts as ground for the belief that American cars will ultimately enjoy a great sale abroad, since it would largely overcome the competitive advantage of cheap labor.

Altogether the prospect is a rosey one for the trans-Atlantic steamer lines, with cars being shipped in both directions. The only thing that mars the outlook for them is the occasional transplantation of a factory from one side to the other. In moves of this kind the foreigners have shown more confidence in America than the American manufacturers have evinced in the sales abroad. Although the reproduction of foreign cars in American factories from the original drawings and patterns has not been uniformly successful so far, yet still another foreign maker, no less a one that De Dion, is credited with planning an American factory, while the record of the starting of factories on the other side for the production of American cars is still blank.

There can be no criticism of any maker grasping whatever opportunities for export trade may come to his hand or of his deliberately planning to invent new ones. In a large way the expensive transportation charges across the ocean and the payment of customs fees would seem to be an economic waste for which the consumer must be correspondingly taxed. If the retail buyer does not ultimately "pay the freight" then the manufacturer must, and there is presented the possibility of the makers on either side of the sea ruining each other by sacrificing their products in a wild export scramble. The foreign maker who cuts his prices to create a sale in America is apt to find the prices cut abroad by the introduction of cars exported from America for sacrifice, and by a repetition and reciprocation of this happy process the markets on both sides can be demoralized.

Because of such tendencies it is much better that makers be encouraged to start branch or subsidiary factories in the fields where they think they see room for action than that they should be tempted into schemes for "dumping" their wares at at prices they would hesitate to accept at home. In shipping to great distances manufacturers are often weak in yielding to pleas for low prices or in falling victim to representations that although the goods have arrived they cannot be accepted at the original price and that the shipper can either grant the reduction asked or pay for the return with transportation charges both ways

For this reason projects like the De Dion enterprise are to be regarded with more kindly feeling than the various proposed import schemes. Nevertheless it must be said that in the face of showing made by the transplanted Mercedes and Napier, that it takes considerable confidence and bravery to undertake such a plan, which unlike the Berliet and Mors instances has no great plants already equipped to take it on simply as an incident to other activities That the proposed De Dion factory will make a feature of commercial vehicles will perhaps give it a more timely birth than if pleasure cars were to be its chief product and whatever battle it may give the established makers will be along legitimate lines rather than unsavory "dumping" of surplus products at long distance.

Where Owners are at Fault.

It is so very easy to blame the motor and then its maker, when for any reason the car refuses duty, that comparatively few owners make proper allowances for their own indiscretions in loading the machine before turning upon the manufacturer either directly or by way of his product. Formerly much of the discontent which was manifest at the behavior of the cars was properly aimed at the devoted head of the producer. Horsepowers, weights, capabilities and endurance were so grossly exaggerated that the reaction was natural and justly deserved in many cases, if not in all.

One of the most prevalent and disastrous causes of balking motors and rapid depreciation is this tendency to overloading, both in passenger and "dead" load. The custom of overpowering many machines has bred among owners a sort of blind confidence that a good machine will carry successfully almost any load which may be thrust upon it. Consequently the average owner invests in whatever suits his fancy and purse in the way of fittings and accessories, perhaps has a closed body built to his own designs by the nearest carriage builder, and taking in all the friends he has seating accommodation for, drives gaily away. Yet from the investigations of these weights, which are mentioned in another column, it is made to appear that the additional weight of the new limousine body may be between three and four hundred pounds over that of the body sold with the car, while similar studies of accessories previously quoted in these columns, show that a well stocked car in touring trim may carry a load of 250 pounds or so of utilities. All told the machine may leave the garage with some 600 pounds of dead load, or the equivalent of four normal passengers. The "friends" climb in after that, and all join in wonder and amazement at the way in which the car climbs or fails to climb the hills.

Makers of commercial vehicles are already beginning to recognize and provide against this tendency to overloading by giving their product a nominal mean rating with a guaranteed overload capacity. With the pleasure car this is undesirable and unnecessary in many cases. The tendency to overload any kind of a machine, simply because the machine will not complain is a natural and very human one, and one which cannot be obliterated with motor cars any more than it ever has been with top buggies.

COMING EVENTS

December 28-January 4, New York City —Importers' show at Madison Square Garden.

January 1-2, Philadelphia, Pa.—Quaker City Motor Club's endurance run to Allentown and return.

January 14-18, Hartford, Conn.—Hartford Automobile Dealers' Association show in Foot Guard Armory Hall.

February 1-8, Providence, R. I.—Show in Providence State armory.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association show in Central Armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

AMERICAN RIVAL FOR BROOKLANDS

Company Incorporated to Construct a Great Automobile Track Near Philadelphia —Glowing Forecast of the Plan.

Hail to the American Brooklands! Hats off to the motordrome that will surpass the great special track at Weybridge, England! Of course, it isn't actually in operation yet, but a small thing like that does not worry the promoters. The fact remains that the company to build the "world's greatest automobile track," has been incorporated under laws of the State of Delaware. The capital stock is a mere bagatelle—$500,000. Named in the papers are F. Franklin Laman, of Philadelphia; George H. B. Martin and S. C. Spencer of Camden, N. J., but these are not the men actually back of the plan to erect the greatest track in the world. Louis Bergdoll, a Philadelphia brewer and racing enthusiast, is said to be the presiden. of the American Motordrome, Inc., for such it is called, while William M. F. Magraw, residence and business not stated, is given the credit for having started the ball rolling.

It will be news to know that automobilists "all over the country are enthusiastic over the announcement that a real racing track is to be constructed" as divulged in a Philadelphia newspaper, for the $500,000 American Motordrome, Inc., did not take out its papers until last week. Also that "all the great automobile events in the United States will be held upon it and this city (meaning Philadelphia) will become the mecca for the foremost auto drivers of the world."

Here is a chance for people with money to spend to get in on the ground floor, and obtain some pretty lithographed certificates —frames for same at a small cost extra, of course—real cheap. It is proposed to conduct the motordrome by a club of automobilists, stock holders, who will be part owners in the course and "all that it holds." It is not thought that persons lacking automobiles but who have the price for stock will be barred from mixing with the fraternity.

William M. F. Magraw, whoever he may be, is entitled to all the credit for having conceived the brilliant scheme to construct the American Motordrome, Inc., right to close to Philadelphia, according to the paper that makes the announcement. Here is how it all came about:

"Mr. Magraw became convinced that automobile racing was certain to meet its death unless a track of the proper type was built. Accidents and fatalities upon the courses used, which really had been constructed for horse racing, made this plain to him long before the A. A. A. put itself on record.

"So he took a trip to England, visited the track at Weybridge and he came back home set upon building an oval even better here in Philadelphia. Upon his return to this city he found that the A. A. A. had taken action and that the autoists and automobile dealers and manufacturers were trying to discover a way to prevent the speed contests from dying out altogether.

"Consequently his suggestion looking to the building of a duplicate of the Weybridge course met with instant favor and the movement has now reached that point where only a few details need to be completed before the work of building can proceed.

"This will be carried forward during the winter and spring months, so that it is almost a certainty that the Motordrome will be in shape for its first meet in June next.

"To carry out the ideas of the promoters it is possible that an expenditure of half a million dollars will be necessary. That was the cost of the great English track."

Plans have even so far materialized that announcement of the location of the American Motordrome, Inc., has been made. It will be situated "on a track of land more than 200 acres in extent, out in Delaware county between the West Chester Pike, City Line avenue, the suburb Llanerch, and the beautiful grounds of the Delaware County Country Club."

It is stated that the track will be two miles in extent, constructed of cinder cement. At its narrowest point the American Motordrome, Inc., will be 100 feet wide, but at the turns, which will be banked at an angle of 30 degrees, there will be a width of 125 feet.

Automobile racing is not the only sport to be held on the grounds of the American Motordrome Inc. Far from it. In the inner oval such sports as baseball, football, the new diabolo, golf, tennis, ballooning; in fact, every outdoor sport will make it become a stadium for all sorts of outdoor sports.

The date and program of the opening meet are anxiously awaited.

Woman Qualifies for 15,000 Mile Club.

Mrs. Myra E. Roach, 3203 McKinley boulevard, Milwaukee, probably is the only woman in the United States who may lay claim to the distinction of having driven one two-cylinder car over 20,000 miles in three consecutive seasons. In establishing this long distance record, Mrs Roach demonstrated the economical qualities of her Rambler Surrey Type One. The average gasolene consumption was one gallon to every fifteen of the 20,000 miles. In the first season she drove 8,000 miles. During the following year her record was 6,000 miles, and in 1907 she drove it 6,000 miles more. Mrs. Roach, of course, has qualified for membership in the Rambler Fifteen Thousand Mile Club, into which Thomas B. Jeffery & Co. will admit only those of its thousands of users who have driven a car over 15,000 miles.

SHORT CARD FOR ORMOND BEACH

Arrangements for the Florida Sandfest Include but Few Events—Special Course for Long Distance Contests.

Unless other events are added between now and the week beginning March 2d, the date set last week by the contest committee of the Automobile Club of America, the Florida carnival, to take place on the beach between Ormond and Daytonna, will be short on events. Of course, the long distance races, of which there will be three, will consume considerable time but only four short distance events have been announced, these being at two miles, one mile and one kilometer, including the record trials at the various distances and the annual race for the Dewar trophy.

The first week in March was selected as the tide at that time of the year will afford from five to six hours daily of good beach, varying each day between the hours of 10 a. m. and 6 p. m., and as the long distance races will require the widest beach and the best hours of daylight this date was selected as being the only one proper to meet all requirements. The fact that the first week in March is the height of the Florida season had something to do with deciding upon this time. The weather at that time is more salubrious than in January.

Arrangements have been made to provide a 16 miles straightaway course with loops at each end, for the long distance events. The loops will be constructed of two-inch planking, furnishing a roadway 32 feet wide, and providing an easy curve by grading away the sandhills at the edge. The loops will be banked six feet high at the outer edge. The start and finish will be in front of the club house at Daytonna, where the grandstand and timing board will be located.

The program of events, as announced, consists of the following, but it is not stated upon which days the several events will be held:

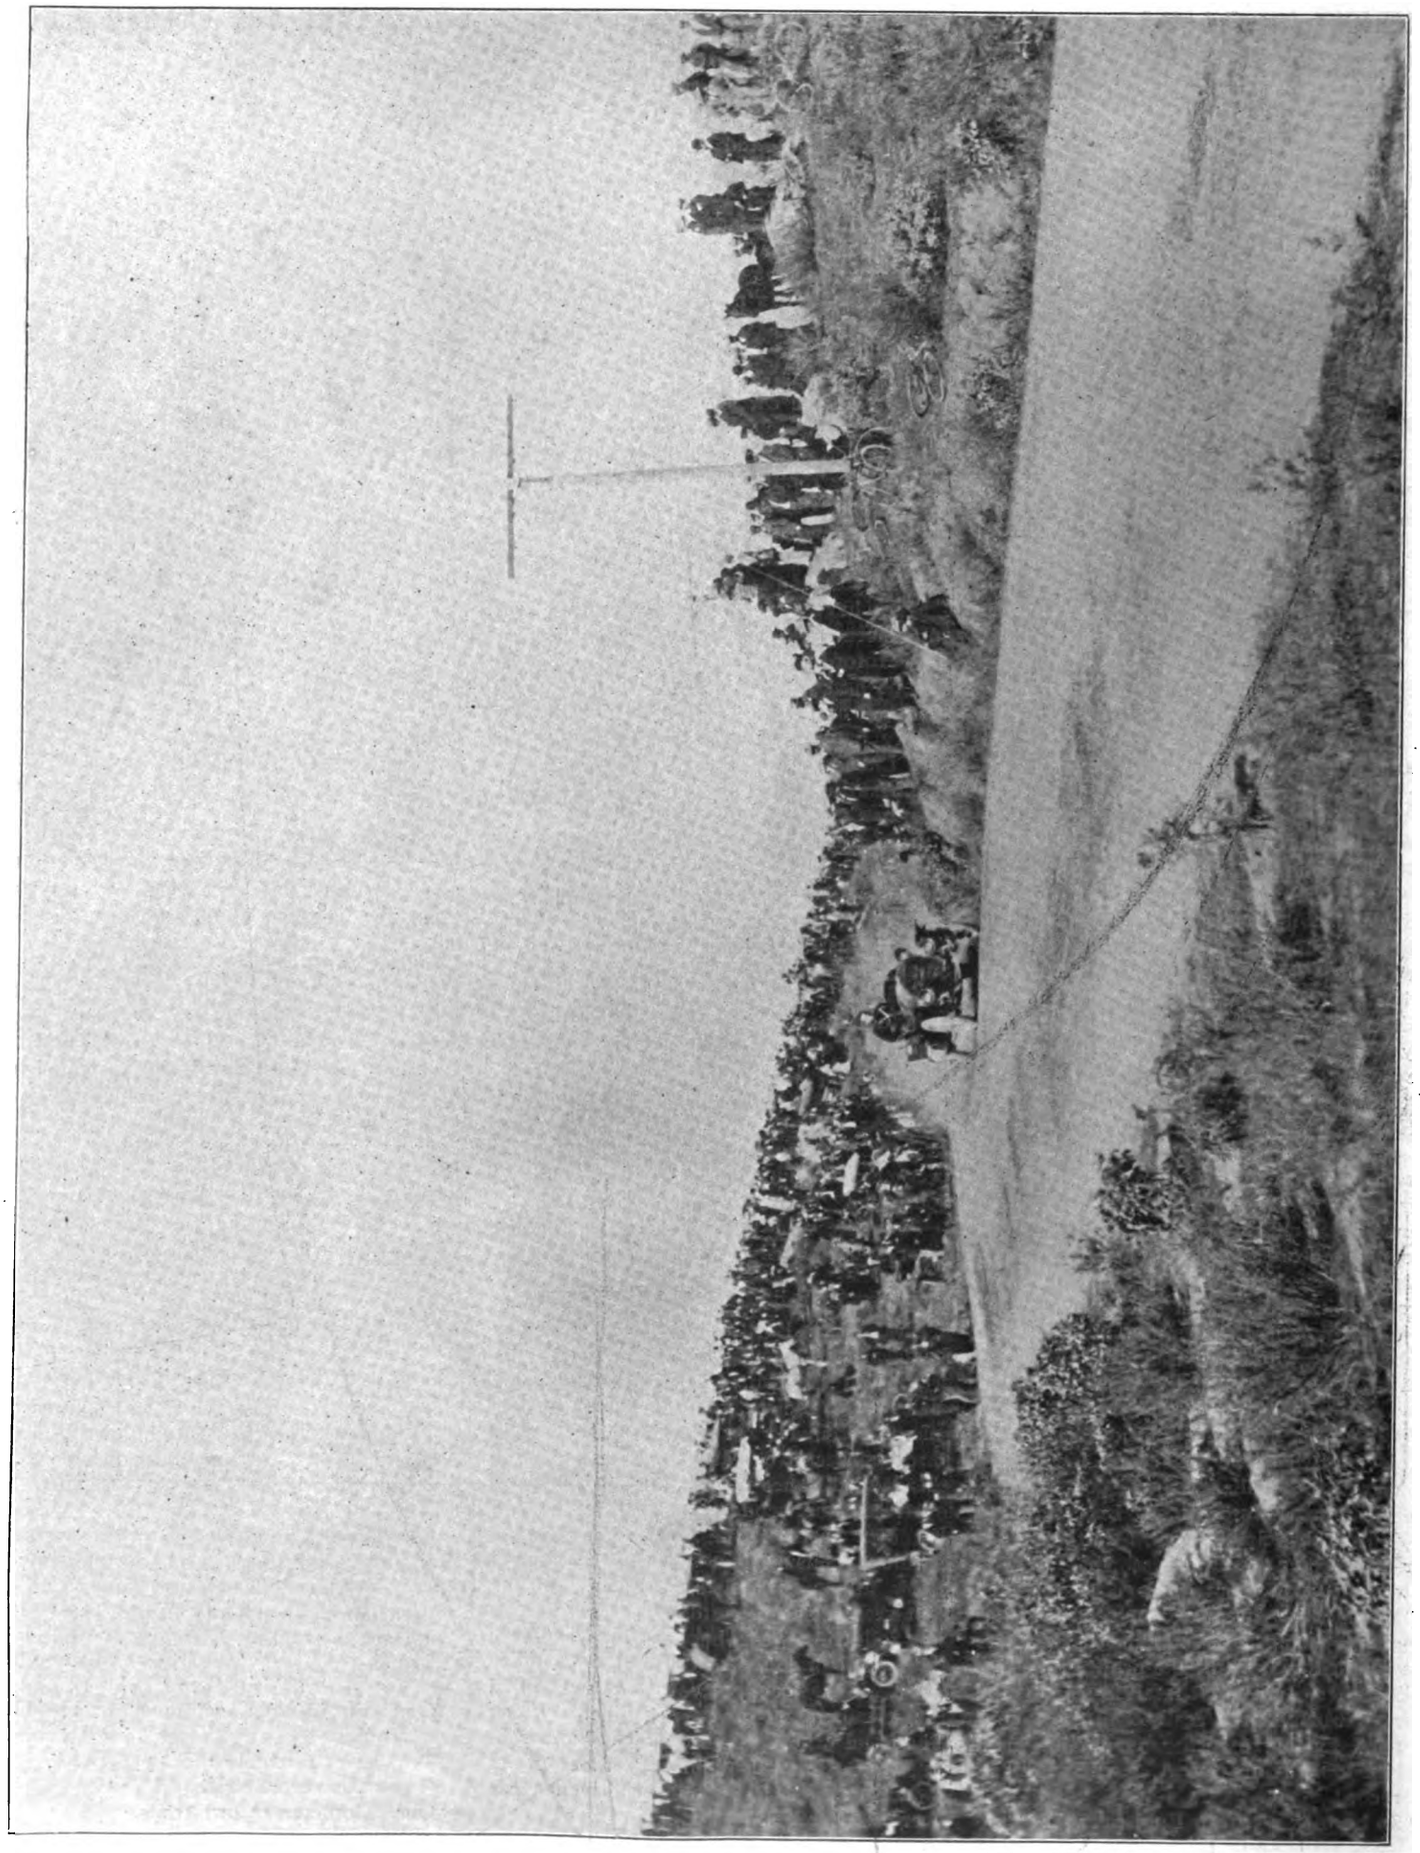
Long Races.

For strictly racing cars, not exceeding 2,424 pounds, for the Automobile Club of America Cup; to re run under the Vanderbilt cup race rules. Distance, 288 miles (9 laps).

For "gentlemen amateur" drivers, invitation, prize and condition to be announced later. Distance 128 miles (4 laps).

International championship for the Minneapolis trophy. Distance, 100 miles.

Short Races.



One mile international open for the Dewar trophy.

Two miles a minute race.

One mile record trials.

One kilometer record trials.

"TINKERITIS LEGIS" IN JERSEY

Automobile Clubs Formulate Suggestions for the Solons—Long List of Proposed Amendments to the Law.

As the legislative season approaches the annual itching to tinker with the automobile laws is making itself felt. The first evidence of it was disclosed at the meeting called by the New Jersey Automobile and Motor Club on Thursday last at which the delegates from all of the clubs in the State met and passed resolutions concerning changes which they think would improve matters. Chief among the suggested alterations in the law is a provision to permit motorists from other States to enter New Jersey without being required to take out a New Jersey license, the privilege to be extended for not more than ten days in two consecutive months for any particular car. That such a provision is highly desirable for the benefit of touring automobilists is apparent. The Jerseyites would also like to see a provision requiring lights on all vehicles, and their recommendations cover a number of other points as to speed limits, registration and other matters.

The full text of the resolutions as passed by the delegates at the meeting in Newark is as follows:

Resolved, That it is the sentiment of this club that a bill be introduced for passage by the Legislature requiring all vehicles, other than those included under the provisions of the motor vehicle law, when using highways of this State, during the period of time between one hour after sunset and one hour before sunrise, and whenever fog renders it impossible to see a long distance, to carry a lighted lamp showing a white light from the front and a red light from the rear, which lamp shall be attached to the left side of the vehicle; or to carry, suspended under the vehicle, a lighted lamp showing a white light in all directions.

That the motor vehicle law be so amended that automobilists in other States, desiring to tour in New Jersey, may be extended that privilege, provided it be for a period of not longer than ten days in any two consecutive months.

That the motor vehicle law be so amended that all licenses shall cease on December 31, 1908, and on December 31 of each year thereafter, and persons holding licenses which will not expire on December 31, 1908, shall be required to pay a pro rata amount for the renewals of same until December 31, 1908; also that the Department of Motor Vehicle Registration and Regulation shall furnish the identification number tag required by the motor vehicle law; that all tags shall be of uniform size and design, and that the design or color of such tags shall be changed each year.

That, owing to the number of accidents and deaths caused by the careless and reckless driving of automobiles, when in an intoxicated condition, the law be so amended as to not only revoke the licenses of persons when found to be in such condition, but that no new licenses be granted to them for a period of five years, and that heavy fines also be inflicted upon them.

That the motor vehicle law be so amended as to make the maximum speed as follows: Six miles an hour upon the sharp curves of streets or at the junction or intersection of prominent streets or thoroughfares; fifteen miles an hour where houses are less than an average of 100 feet apart; twenty-five miles an hour in the open country or where houses are at least on an average of 100 feet apart.

That it be made a misdemeanor to throw, place or deposit any glass or sharp or cutting substance in or upon the public highways of this State.

That the corps of inspectors of the Department of Motor Vehicle Registration and Regulation, acting under the provisions of the motor vehicle law, be increased to fifty, twenty-five to receive compensation as at present provided, and twenty-five who shall be automobilists resident in this State, to act without compensation, said inspectors to have the authority to properly enforce the automobile law, to arrest violators of same, and be under the supervision of the Commissioner of Motor Vehicles.

That the president of the Associated Automobile Clubs of New Jersey be requested to call a meeting of a committee of one delegate from each club composing the association, for the purpose of conferring with Senator Joseph S. Frelinghuysen and Commissioner J. B. R. Smith, to endeavor to secure their co-operation and support in having such amendments made to the present automobile law, when the Legislature next convenes, as have been discussed and favorably acted upon by resolutions at this meeting.

That the motor vehicle law be so amended as to make it obligatory for justices of the peace and police courts to turn into the State at definite intervals all fines collected under the motor vehicle law.

Farmer's Automobile That Pays for Itself.

Twenty days saved in the year is the way Chester Parker, of Cornish, Maine, figures out part of the advantage of owning an automobile. Parker owns a big produce farm and it used to require from one day to a day and a half to get from home to Portland and back when he had marketing to do. With his Cleveland touring car, which has displaced his two-horse team, he now makes the round trip in greatly reduced time. He gets his butter, eggs and other table delicacies to Portland always on time for the Boston boat, and in so much better shape than before that he realizes twenty per cent. better prices. The automobile already has paid for itself, he says.

SAVANNAH EAGER FOR RACING

Manufacturers Invited to Consider the Desirability of a Stock Car Tournament There—Course Already Provided.

That Savannah, Ga., really is being seriously considered as a location for a series of long distance races for stock chassis fitted with racing bodies, to be held during March directly after the Florida tournament, is made evident by the fact that President William H. Hotchkiss, of the American Automobile Association, has authorized a letter to be sent to the various manufactures, asking their views as to whether or not a stock car tournament is desirable and if so what races should be held.

Mr. Hotchkiss's action is the result of a visit of a committee of A. A. A. men to Savannah, at the invitation of the Savannah Automobile Club, to inspect the proposed course and to investigate conditions in the Georgia locality. The committee consisted of F. G. Webb, representing the racing board; N. H. Van Sicklen, of the technical board, and F. H. Elliott, secretary of the American Automobile Association. The committee states that it made a thorough investigation in Savannah and its report led the rules committee of the technical board to adopt tentative rules at a meeting held in Buffalo last Saturday, for suggestion to the racing board. These provide for a series of contests between strictly stock cars with racing bodies, for light cars, for heavy four cylinder cars, high powered runabouts and for six cylinder cars.

The investigating committee found that Savannah is truly anxious to hold an automobile tournament near that city during March next, and that the Savannah Automobile Club already has attended to nearly all the preliminary arrangements and has secured a course about 20 miles, or for shorter races, a ten miles course, the latter with long banked turns. The larger course has twelve turns but at least ten of these can be reconstructed and banked so that they may be taken at high speed. The road surface is hard save in one or two places, which can be fixed at slight expense.

Co-operation by the local authorities, including the mayor, presidents of the Chamber of Commerce and the Cotton Exchange, the highway officials, and militia commanders, besides of course, the committee appointed from the local automobile club, is assured. The highway officials promise to attend to oiling the course and fencing off the roadways intersecting it, while the military authorities have promised to furnish 1,200 to 1,500 of State troops to police the course during the progress of the tournament.

If the manufacturers consider the tournament advisable, to the extent of entering

Digitized by Google

cars, it is planned to hold the meet during the second week after the Florida carnival. At this time spring is far enough advanced to insure good weather and roads, while the return of Southern tourists has begun. It is planned to have the meet last three days. A meeting of the racing board will be held in New York City next Saturday, 28th inst., when letters from the manufacturers will be read and a decision as to holding the suggested meet, probably will be arrived at.

Comparing Horse and Motor Delivery.

Hayden Eames, general manager of the Studebaker Automobile Co., says that the more he investigates the desirability of motor vehicle delivery as compared with horse delivery, the more firmly is he convinced of the superiority of the former method. With reference to a comparison of the two systems he says:

"The only way to arrive at a fair comparison between motor vehicle delivery and horse delivery, is to make an absolutely complete ledger statement of what it costs to do the work conveniently with horses, including rent of stable space, insurance, interest on investment, and every part of a financial accounting. Then, having obtained a thorough knowledge of precisely what service is required, and what the limitations of that service are, proceed to draw up specifications for a corresponding power wagon installation, or organization, to do the same work. Having done this, prepare an accurate ledger statement of the expected performance of this second installation, and compare the two. When the power wagons are properly selected and applied, it is an extremely rare case when the advantage of the power wagon ledger sheet is not overwhelming."

Australian Non-Stop Road Record.

What is claimed as a non-stop road record was made on November 21 and 22 in Australia, by H. L. Stevens and H. B. James, in a 40 horsepower car, when they covered 777 miles in 24 hours. There are no automobile or large trotting tracks in Australia suitable for automobile racing so that the record breaking aspirants had to map off a course over a limited area of roads. Australia being a wild country, in that the roads are not as good or as free from roving animals as those in America, the feat of driving at a mile a minute race through a foggy night was really remarkable. One of the noteworthy incidents of the ride was the great number of rabbits and birds which fell victims to the speeding car. Plovers sometimes escaped destruction when surprised, but magpies were slaughtered wholesale, and hundreds of rabbits were killed during the night, a fact that did not become known until the course was recovered in the morning. Another feature was that not once was mechanical or tire trouble experienced during the 777 miles run.

CUP FOR MOST POPULAR DRIVER

To be Awarded by Vote of Contestants in Philadelphia Endurance Run—Program for the Quaker City Contest.

There is a chance for some automobile driver to win a cup by playing the good samaritan act in the forthcoming New Year's-and-the-Next-Day endurance run of the Quaker City Motor Club, from Philadelphia to Allentown and return. Instead of providing only two classes, as in last year's contest, the committee has divided the entrants into four classes—touring cars, high-powered runabouts, small runabouts and a go-as-you-please division. There will be prizes for the winner in each division, but the cup in the free lance brigade will not be for the best score, but will be given to the most popular driver in it, to be determined by a vote of all those on the run.

The run will last two days, January 1st and 2d, the contestant leaving Philadelphia at 9 a. m. Wednesday and starting from Allentown at the same time on the following day. On the going trip on New Year's Day there will be four controls, including the night stop at Allentown. These will be located at Doylestown. Ottsville and Easton.

On the return journey on Thursday five checking stations will be located at Kutztown, Reading, Pottstown, Norristown and Philadelphia. The distance for the first day is 78.9 miles and for the second day 93.7 miles, making a total mileage of 172.6.

According to the committee interest in the run this year is by no means confined to Philadelphia. Entries are expected from other cities and it is stated that all the towns along the route are planning to welcome the tourists as they pass through. Some of the towns have nothing more than the arrival of the mail to stir them from their Pennsylvania lethargy, so it is not surprising that they should make a fuss over the passing of an automobile tour. Allentown, it is said, will spread itself to entertain the tourists, a turkey dinner with all the "fixin's," a theatre party and a dance arranged by the girls of the place, being among the inducements to enter the run.

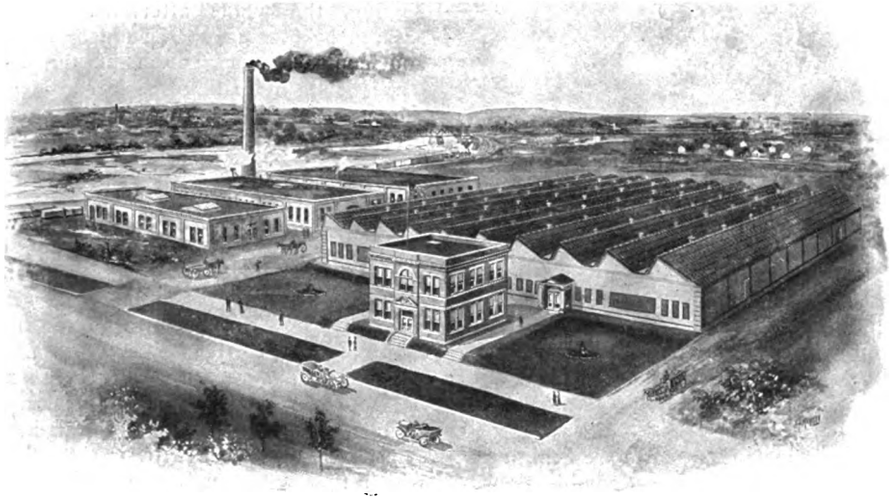
Why the Ride was Postponed

With no recognition of the conveniences of life, rude and unfeeling constables just ruined the social plans of Miss Stella Plotke, of St. Louis, on a recent evening by taking possession of her automobile. Miss Plotke had arranged to take a party of friends out for a spin in her electric machine, but when she called up the garage where it had been left for charging, she was informed that the machine was not there. As a result of her agitated questionings she learned that some constables, fortified with an imposing warrant, had taken it away. Miss Plotke was indignant and roundly took the garage manager to task for letting any one take the machine without her order. The garage manager submitted that it was only in obedience to the authority of the legal papers that he had permitted the machine to go. The automobile party was called off temporarily and Miss Plotke set about recovering her machine. She was surprised to learn that her $1,500 automobile had been taken as security for a miserable repair bill of $45 which she had quite overlooked paying, although it was incurred last October. To get the vehicle back she at once tendered her check, but actual cash was demanded and subsequently produced. The automobile party was given one day later than originally planned.

Luxury for the Hobo.

Luxury of travel for the hobo, the tramp and the bum has been greatly increased by the growth of the automobile business. In their transcontinental travels the gentry belonging to these honored orders have in the past accounted themselves fortunate when they could crawl into a "side door Pullman" containing straw or other soft material on which to sleep, as the freight trains dragged their slow and painful way across the western deserts and mountain ranges. But the journey to the Pacific Coast is now one of ease and delight owing to the large shipments of automobiles that nearly every west bound freight has in its list. By gaining entrance to a car containing automobiles the non-paying traveler secures for himself a berth that in comfort beats the real Pullmans. The heavily padded leather upholstery of a motor car tonneau makes a soft and pleasant bed and the springs of the automobile and the padding taek away all the jars and vibration that ordinarily accompany freight car riding. If a hobo be fortunate enough to find a car carrying a large limousine body touring machine, then indeed is he provided with a bed fit for a king, and he will almost go out and buy food at various stations where the train stops rather than stop over for any pan-handling and take the chance of not finding another stateroom as luxurious.

Club Members as Road Inspectors.



That club members make it a regular practice to observe highway conditions and report any defects existing within their immediate territory to the club officers, to be compiled in the form of complaints to the proper authorities, is a suggestion which is being considered by the members of the Lancaster (Pa.) Automobile Club. The club is carrying on a vigorous good roads campaign and the scheme of putting all the members to work as "spotters" resulted from similar services which have been rendered to good advantage by specially appointed committee of members of the club.

WARNER'S DUST PROOF FACTORY

New Plant for the Production of Autometers a Model of Modern Construction—Its System of Ventilation.

Washed air, white paint and floods of light, together with a line shaft system mounted on ball bearings, are some of the features of the new plant of which the Warner Instrument Co., of Detroit, Wis., has taken possession. It is to be a "show place" for visitors, as an example of the most modern factory construction. The building is of reinforced concrete and, as shown in the illustration, has a roof of the saw tooth variety, the vertical sides of the teeth being fitted with prism glass. The main shop is 100 by 200 feet

WHERE THE WARNER INSTRUMENTS ARE MADE

The interior walls and the slant of the saw teeth are plastered with snow white rock plaster and all exposed cement work is surfaced with a specially prepared white water paint. The entire shafting system is also painted white, including the pulleys, the object being to reflect and make available for the workmen every ray of light. All doors and windows are kept closed winter and summer and there are no ventilators in sight. The ventilation is effected by an air blower system which draws in fresh air from the outside by mechanical power. On its way into the building all of the air is passed through a fine spray of water which washes out every particle of dust, thus making the inside of the factory as nearly dustless as it can be. After passing through the water spray the air is either heated or cooled, according to the season. Every provision has been made for the comfort of the employes. Large lavatories and locker rooms have been built, 32 by 40 feet, and fitted in the most sanitary manner.

In addition to being painted white, the power shafting system is rather out of the ordinary in other ways. It is mounted on channel iron beams fastened to special cast iron brackets which were set in proper position in the concrete during the construction of the building. Genuine imported D. W. F. ball bearings are used. This results in such a reduction of friction that a stretch of 100 feet of shafting weighing nearly 700 pounds can be turned easily with the thumb and finger, without a pulley.

Care of Acetylene Generators.

A cold weather admonition which, despite its comparative importance is seldom voiced, is that regarding the care of acetylene gas generators. The motorist of experience seldom neglects to attend to the jacket water in his car when the temperature is very low, either draining it off when the car is to stand unused for any length of time, or infusing a proper amount of anti-freezing mixture into it. The water retainers of gas generators are not always given the same attention, however, and the result is apt to be disastrous to the thin metal composing them. Except when the lamps are to be burned immediately, the containers never should be filled with water if there is any danger of freezing. When in use, the heat of generation, usually is sufficient to overcome any such tendency.

Wyoming Produces a Wonderful Gear.

The latest world beater is from away out in Sheridan, Wyo. According to a dispatch from that dot on the map, Walter Scott, a machinist, has refused an offer of $25,000 for an invention by which he claims "to have perfected a new gearing for transmission of power on automobiles, whereby the usual jar and jerk, when a change is made from one speed to another, is entirely done away with."

BODY WEIGHT AND ITS FACTORS

Specimen Specifications of the Load Imposed on the Machine—Why Stated Weights are Misleading.

As is frequently pointed out the inaccuracy of the power ratings given their motors by many makers often are no greater than the inaccuracies in the stated weights of the machines as a whole. In many cases this latter inexactitude may be produced in part by the owner himself, through his habit of overloading the machine with accessories. In other cases it may be laid to other causes also largely beyond the control of the maker. The most common of these is the use of a different body from that of the stock car, or one which has been increased in weight through alterations of various sorts.

The subject of body weights is an exceedingly difficult one to get at with any degree of specific exactitude, owing to the sensitiveness of many of the makers, which precludes the possibility of getting thoroughly comparative data. The following material which has been compiled by the foreigh authority which recently investigated the weights of accessories, as told in these columns, is sufficiently representative to illustrate the point in question, however. The weights are stated to be those of the product of a single maker, and therefore cannot be taken as of material value except in a relative way.

For open side entrance bodies the following weights are given:

	Pounds.
18 h. p. Standard Tulip, unpainted, with body irons, but without footboards	224
Footboards, with rubber and step edging	37¾
Standard set of iron wings, with stays, platform, steps, and brackets	73¾
Trimming, including cushions	90
Weight of body complete	425½
30 h. p. ditto, with iron panels and usual body irons	206
Equipments as above	201⅗
Weight of body complete	407½
30 h. p. Roi des Belgas, unpainted, with aluminum panels and usual body irons	224
Equipments as above	201½
Weight of body complete	425½

For standard extension cape hood, including joints and fittings for either of the above, add 53
For standard screen, add 13¾

For closed bodies, on the other hand, the weights are:

	Pounds.
18 h. p. single Landaulet, unpainted, fitted with usual body irons, without footboards	353
Footboards	15¾
Standard set iron wing frames only, with stays, platform, steps, and brackets	71¼

third. A material improvement was also made by altering the adjustment

"The condition of the third day for tests (b), (c) and (d) was the best. The carbonic oxide was respectively 1.8, 2.4, and 2.2 per cent. It was obvious that on the third day more air was admitted in proportion to petrol, because the free oxygen rose from 0.1 to 0.6. Running light, too, on the third day, trial (c), the free oxygen had risen to 2.2 per cent., with a carbonic oxide of 2.4 per cent.

"From these tests it appears probable that many cars must be running upon the road as ordinarily adjusted, discharging as much as 7 per cent. of carbonic oxide into the atmosphere. That this is not peculiar to my own car, I am aware from my knowledge of the Royal Automobile Club tests, and further, the directors of one important firm have been good enough to send me an account of experiments made by them with their own cars as to exhaust gases, and I find that at full load, with a particular engine, very similar variations occur, the carbonic oxide sometimes sinks as low as 0.8 per cent., and sometimes rises as high as 3 per cent., whereas, with light load, the carbonic oxide appears to sometimes attain from 6 to 8 per cent."

Apart from considerations of the healthful influence of purifying the exhaust, however, the question of fuel economy also should be taken into account, he thinks, although the less important of the two.

"Taking the analyses under (c), first series, where the maximum amount of carbonic oxide is shown in my experiments, I have calculated from that analysis how much of the total heat of combustion of the petrol is wasted by throwing away unburned gases. An examination of the analyses proves that 30 per cent. of the total carbon present in the original petrol is discharged as methane, so that nearly 35 per cent. of the original carbon in the petrol has been incompletely burned, or not burned at all. In this same case 27 per cent. of the total hydrogen in the fuel remains unburned. Calculating from these numbers the losses, I find that nearly 30 per cent. of the total heat possible on combustion is not evolved at all, because of the existence of inflammable gases discharged in the exhaust products. This is the worst case on Table I.

"Take now the best test under (d), third series. Here the engine was well loaded. Even in this case 17.6 per cent. of the total carbon is present in carbonic oxide and methane, and 6.7 per cent of the total hydrogen in methane and free hydrogen. This gives a loss of 10 per cent. of the total heat, due to incomplete combustion. In the best example, therefore, upon this sheet only 90 per cent. of the total heat of the fuel can be utilized in the engine.

"This 90 per cent. of heat evolution in the engine is a very good result, having before me the tests made with all the cars examined by me. Of other cars examined, the best gave 95 per cent. heat evolution, 5 per cent. waste due to imperfect combustion, and the worst gave 60 per cent. heat evolution and 40 per cent. heat discharged in the exhaust gases, due to imperfect combustion. Undoubtedly practically perfect results can be obtained, when petrol is properly proportioned to air. This is clearly seen from some interesting experiments described by Professor H. Hopkinson, of Cambridge, and Mr. L. G. Morse, in a paper read before the British Association this year."

After discussing these experiments which, he says, are valuable as showing that an engine adjusted for maximum thermal efficiencies at full power discharges a practically innocuous exhaust, he continues: "An engine so adjusted may also have an innocuous exhaust at lighter loads, but this by no means follows. It depends on the nature of the adjustment made by the compensating contrivance working in connection with the carburetter, whatever that compensating contrivance may be.

"All these compensating contrivances vary with varying speed. This, of course, gives some adjustment, but that not all that is required. An ideal compensating contrivance should vary not with varying speed, but with varying quantity of mixture drawn in in a given time. In a car running on the road, for example, the speed of rotation of the engine may be kept perfectly constant, but the position of the throttle will vary from point to point of the road; that is, the engine speed may be constant, but the volume taken into the engine may vary within large limits. As the problem is to charge any given volume of air passing into the engine with a practically unvarying proportion of petrol vapor in a uniform manner, it seems to me that all systems of speed control must fail to obtain proportionality throughout the whole range. If the entering air could be made to drive a fan similar, say, to an anemometer, with proper precautions, this fan or anemometer could be made to run at a speed of rotation very closely proportional to the volume of air supply throughout the whole range of conditions. If a spindle be driven by this anemometer, and a small chain passed from that spindle into a petrol vessel at constant level, then it would be possible to work out a carburetting contrivance which supplied the air passed through it on its way to the engine with petrol exactly in proportion to the charge volume taken in. I believe contrivances of this kind have been proposed, and it seems to me that although we have practical difficulties, if correctly carried out, they should be able to give a perfectly uniform mixture to an engine under all conditions of speed variation and charge volume variation. . . . .

"The most important point apparent from these analyses is this: that complete combustion by no means follows because of excess of oxygen. That is, we may adjust a carburetter in such a way as to give a substantial excess of oxygen throughout its whole range, and yet we may not succeed in suppressing carbonic oxide or completing combustion. . . . .

"It appears to me that in working out exhaust analyses for comparison of the merits of different cars or different adjustments, the total fuel consumed should be tested in any given experiment, and from the exhaust gas analysis there should be calculated the proportion of that fuel which is rejected without burning. This alone gives the true standard. Under each circumstance of the test, cars tried in this way would show that for a given amount of fuel burned the car discharged, say, so much weight of carbonic oxide or so much volume of carbonic oxide per minute from the total weight or volume of fuel given to it. . . . .

"So far, then, as my experiments have carried me at present, the folowing conditions appear to produce imperfect combustion:

1. Too rich mixture with insufficiency of oxygen.

2. Too weak mixture with excess of oxygen, but too slow a rate of ignition and combustion.

3. Irregular mixture—mixture supplied too rich in composition at one part of the stroke, and too weak in another; that, is, bad mixture.

4. Engine and carburetter cold. This tends to cause imperfect combustion, due partly to low temperature, due partly to bad carburetting.

5. Improper timing of ignition, and missed ignitions.

6. Ignition in the body of the cylinder, instead of in a port. This will produce imperfect combustion at light loads.

"To get the best and most rapid combustion, at light loads, it is, in my view, desirable that the charge should enter the cylinder by way of a port of some little length, and that the ignition of the charge should be accomplished in the port itself, and not in the cylinder. By so combining the carburetter and ignition contrivances, I believe that a quite innocuous exhaust could be obtained, under light and heavy loads at all rates of speed, with a great saving in fuel consumption and wear and tear of the engine.

"It is well known that engines igniting in the port are more flexible. The reason of this is obvious. As the charge is reduced in volume, the proportions of exhaust products in the engine are not so reduced. They remain not quite, but nearly constant, in volume and weight Accordingly, as the load becomes less and less, the effective charge added becomes more and more dilute, and the mean mixture soon passes the firing point. By igniting in the port, a pocket of rich mixture is retained to the last, and this rich mixture, if fired sufficiently early, produces a practically complete combustion in the weaker mixture filling the cylinder."

REDUCTION OF PISTON WEIGHT

Why It is Desirable and How It May be Secured—Two Devices of a Typical Character.

It is extremely difficult for the layman to appreciate how much difference in the power and smoothness of action of the internal combustion motor may be brought about by suitably lightening the moving parts. In the main, the improvement is due to the reduction of the inertia of the reciprocating parts—itself objectionable because they must be stopped and reversed in their direction of motion twice in the course of every revolution of the crank shaft. Any discussion of the benefit derived from lightening the pistons and connecting rods, must relate to this rather than to the reduction of the total weight of the motor, of which their weight forms an inconsiderable part. The piston being the heavier of the two, it is most desirable to reduce its weight as much as possible, and on this account mainly, not a little effort is being exerted abroad, in an effort to evolve a suitable pressed or cast steel piston.

As to the desirability of reducing the piston weight as much as possible, a French expert explains that "as the movement of the piston is periodically accelerated and retarded it necessarily follows that the effect of its inertia tends to retard it during the first half and accelerate it during the second half of its stroke. This being so, this curious conclusion can be drawn, namely that running fast and completing its compression stroke a piston is driving, or is tending to drive, the fly wheel. In the same way, the thrust of the explosion rapidly diminishes from the moment of the ignition."

"Owing to the great amount of friction set up by the forces of inertia, they do not by any means return the power required to overcome them, and soon exert a considerable influence on the efficiency of a motor amounting almost to the effect of a brake at high engine speeds," he continues. "Whatever may be said to the contrary, the possibility of constructing engines capable of very high speeds is greatly to be desired. Such possibilities will reduce weight cost of production, complications, and also weight of transmission devices.

"The effect of lightening the piston is at once to reduce the stress of the connecting rod, allowing this member itself to be less weighty, and so adding to the efficiency of the motor.

"The adoption of these light steel pistons has another recommendation, and that is the use of metal in such a way that porosity, uncertainty, and flaws peculiar to cast iron are entirely avoided"

Turning to methods of constructing light pistons which are already in use, he continues:

"As early as 1898 M. Barbaroux, works manager of the car department of the Delaunay-Belleville firm, led the way in this direction by taking out an interesting patent. The form of piston then covered by him, and which is shown in Fig. 1, owes

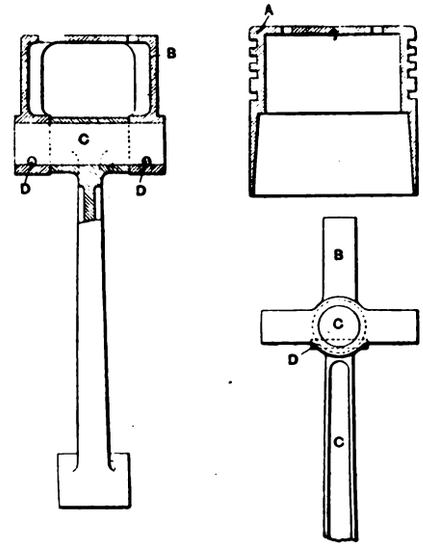

Fig. 1

its lightness to the method of fitting the gudgeon pin. The body of the piston, which was in cast iron, but could be easily made of pressed steel, was capable of being turned inside and out, and so its weight was reduced to the uttermost. The gudgeon C was carried in the circular lugs of a ring-based fork, to which it was secured by the tapered pins D D. This ring-based fork

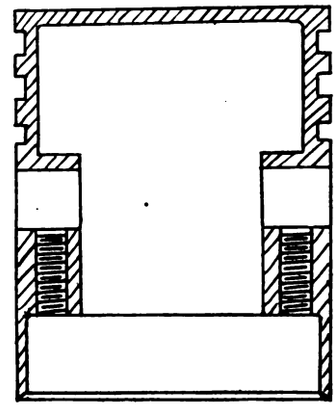

Fig. 2

was set in and riveted to the crown of the piston by the holes shown in each, the ring portion fitting tightly into the lower tapered mouth of the piston. This piston was both easily and cheaply machined and assembled, while the gudgeon pin was most securely carried and fixed. In the case of any breakage of the gudgeon pin or the securing keys the cylinder walls were not scored. Later developments resulted in pistons of similar design pressed in one piece."

But in the pressed steel piston he believes rests the successful light piston of the future. One such is produced by the Société de Montbard-Auluoye, who have obtained most satisfactory results with it, as he asserts. "Fig 2 shows a section of a piston made by this firm in 'acier de nuance,' and, being hot, perfect homogenity of the metal is ensured. By the use of pistons so formed all the troubles which are alleged to follow in the path of the employment of cast iron pistons are avoided.

"After considerable use cast iron pistons are prone to fracture round the open edge—a failure which may result in costly repairs. The use of pressed steel pistons avoids any possibility of such a contretemps. The use of pressed steel permits lighter pistons, as already set out, by the reduction of sectional areas, and the speed and efficiency of the engine is thereby improved."

Aiding Buyers in Choosing Colors.

Instead of attempting to depict by printer's ink the colors which purchasers of Locomobiles may nominate for their machines, the Locomobile Co. of America is issuing a supplement to its catalog in the form of a color sample card. This bears twelve strips finished with the actual colors as used on the cars, including four shades of red, four greens, two blues, a grey, and a striping yellow. In addition to giving the true colors, the card has a further value, according to the Locomobile Co. in that it "tends to limit the customer's ambitions to combinations which have been found to be in good taste and to colors that have been proved sensible, thoroughly practical and durable."

Making a Reliable Weld.

Generally speaking, the repair work which it becomes necessary to turn over to the country blacksmith is such as the average motorist can neither perform himself, nor superintend, except in the most superficial manner. It is well to bear in mind, however, that a weld is not certain to be reliable unless the lips of the "scarves" are well closed up, and the actual smooth and not crumbled from being overheated, and that a crack which is closed up with a few nimble blows of the hammer is not "healed" even though the smith may give every assurance that it is "good enough."

New Motor Starting Device.

A new foreign motor starting device comprises a crank mounted on the dashboard and a pedal which when depressed opens all the inlet valves and at the same time breaks the ignition circuit The release of conpression renders it very easy to turn over the motor, the cylinders thus being filled with gas at atmospheric pressure. When the pedal is released after cranking, the motor starts "on the spark."

Tours Planned for the Public.

With the handsomest, strongest and most agreeable drivers that can be obtained, Frederick Ruther, of Hicksville, Long Island, plans to institute an automobile service that will permit residents and visitors in New York City to tour Long Island in motor cars. His scheme comprehends trips of one, two and three days, with all necessary hotel accommodations. Ruther has already had considerable experience in operating automobile routes from Hicksville to Huntington, Amityville, Mineola, Oyster Bay and other villages during the past season, and feels that he is sure of success in his larger enterprise.

The project as planned would be operated by the Interboro Motor Despatch Company, having Ruther as its president. The cars which he intends using are 65 horsepower vehicles of the sight-seeing order, carrying twenty passengers and capable of 35 miles an hour. These would leave from convenient points in New York and Brooklyn for tours through Long Island and possibly Connecticut and New Jersey, if the custom would warrant it. As laid out, a one day tour in Long Island would be as follows: Start from New York or Brooklyn at 9 a. m.; thence along the north shore through Flushing, Douglaston, Great Neck, Roslyn; thence to Mineola, Westbury, Hicksville, Coldspring Harbor, Huntington or Centreport, where a two hour stop for dinner would be made at one of the best hotels; thence across the Island to the South side and home, where the car would be scheduled to arrive at about 6 o'clock in the evening, after having covered about 100 miles. The charge for such a day's tour, including all expenses, is tentatively set at $5. By extending the route toward the eastern end of the island, tours of two and three days could be arranged, with good hotel accommodations. Ruther plans to use the Motor Parkway when it is completed, for part of his touring.

Not only does Ruther conceive this plan to acquaint people from New York with the beauties of Long Island scenery, but he also sees possibilities of conducting tours to New York for the patronage of the Long Islanders. The latter would not only thus see parts of the island that they were unfamiliar with, but upon reaching New York a "rubberneck" pilot would get aboard and give them the megaphone "spiel" on their trip through the city.

Line to Connect Tennessee Towns.

Feeling the need of suitable transportation between Jefferson City and Dandridge, Tenn., citizens of these cities have formed the Jefferson County Electric Motor Co., which will operate passenger automobiles between these and intervening towns. The company also will transport the mails and baggage. The officers are: President, Hal S. Harris; vice-president, W. R. Maynard; secretary, L. M. King; directors, S. T. Harris, Dr. F. P. Best, C. E. Harris, J. T. Holt, Mrs. Victoria Swan, Frank Miller, B. H. Mitchell, Arthur Swan, J. Frank Park, Jr., Dr. Tinsley, Walter Shepard and Ernest Logan.

Pardington Heads Contest Committee.

A. R. Pardington has been appointed chairman of the contest committee of the Long Island Automobile Club by President Charles Jerome Edwards, and his presence at the head of this important committee intimates that the members will not want for lack of interesting contests during the coming season. Mr. Pardington's associates will be C. G. Arnold and F. D. Bandell. The other various committees appointed, the first named member in each case being the chairman, are as follows: Membership, Dr. William P. Richardson, Frederick G. Jahn, Samuel Burns; finance and auditing, J. H. Emanuel, Jr., Dr. C. B. Parker, C. H. Galt; law and legislation, Dr. William P. Richardson, Charles C. Cluff, Frank G. Webb, Russell A. Field; house and entertainment, Edwin Melvin, Frank G. Webb, Russell A. Field; runs and tours, Leffert Lefferts, A. C. Alderman, Louis T. Hunt; technical, Louis T. Weiss, Dr. V. L. Hunter, H. W. Fairrax; good roads, Samuel H. Burns, Lew H. Allen, Cleveland Litchfield; garage, Dr. A. C. Howe, Alfred Wilmarth, C. A. Colson, Dr. F. M. Sharpe, W. T. Wintringham.

Watchman's Joy Ride was Costly.

The Crescent Automobile Co., Kansas City, made only one mistake when they hired Elmer Ashland to watch at the door of the garage at 921 Wyandotte avenue, to see that chauffeurs didn't go out joy riding at midnight when their employers were asleep. The Crescent company should have hired somebody to watch Ashland, and then it might not have happened that when John Barleycorn, sometimes traveling under the alias, Demon Rum came along and proposed to Ashland that they go out for a midnight spin together, the latter would have so readily accepted the invitation. Barleycorn was absent in court the next morning, when the story of his corupting influence was told, but Judge Kyle fined Ashland $25 for yielding to temptation.

Five Years Sentence for Automobile Thief.

Stealing automobiles is a pastime that doubtless will not become popular in Kansas. James T. Ambrose is a young man who, not possessing the necessary wherewithal, attempted to steal a car from the Kansas Auto & Supply Co., of Topeka. Sheriff Wilkerson was hot on his trail when he received advices that Ambrose had been arrested in Kansas City for a similar offense. Before the sheriff reached Kansas City, Ambrose had pleaded guilty in court to the Kansas City charge and had been sentenced to five years in the State penitentiary at Jefferson City. Justice was as rapid in its operation as Ambrose was in his thievery.

Prizes for Improvement of Roads.

The Milwaukee Automobile Club is going to get into the good roads movement strong during the coming year. At a meeting of the club last week, plans were laid for an active campaign and good results are expected. In the improvement of the country roads the co-operation of the farmers will be sought. A prize will be offered for the farmer who keeps the road adioining his property in the best condition. President L. C. Fuldner named the following committees: Membership, W. L. Hibbard, O. A. Hoffmann, George G. Huseby, Faustin Prinz and Robert G. Bates; legislature, James T. Drought, the Rev J. Szukalski, Julius E. Roehr, Phil A. Grau and George A. West; runs and tours, W. H. Pipkorn, C. W. Norris, George Prague, J. E. Farber, Thomas M. Drought; good roads, E. F. Wiedecken, R. G. Wagner, A. F. Sciliday, Frank F. Wilbur, H. H. Rice; racing, Emil Schandein. Lee A. Dearbolt, E. H. Schwartzburg, J. L. Potter, A. L. Brenkle; auditing, J. C. Baird, Phil A. Grau, Lee A. Dearbolt; technical, Clarke S. Drake, A. W. Shattuck, C. L. Haase, Jr., M. C. Moore and C. Scholtka.

Why the Assessor Piled on Taxation.

"Well, automobiles are both a luxury and a nuisance and I believe that they should be assessed at $1,000 anyway!" This is the statement accredited to Robert B. Harris, a tax assessor of Montclair, N. J., when Thomas W. Bardsley appeared before the County Tax Board last week, to register a protest against the assessed valuation of his car. Bardsley claimed that his car had been assessed at $800, which was twice as much as it was worth, explaining that he could prove by his bill that he had paid only $475 for it. It was after this explanation that Assessor Harris expressed his "sentiments."

Wilkes-Barre to Have a Bus Line.

According to advices from Wilkes-Barre, Pa., the New York Transportation Co., of New York City, will form a company in the Diamond City to maintain an automobile 'bus line. Four large passenger cars will be placed in operation at once, and if they prove a success, taximeter cabs also will give Wilkes-Barre metropolitan atmosphere.

To Carry Passengers or Saw Wood.

"A. B. Whitney, a well known mechanical genius has under construction a peculiar vehicle. It is a combination automobile and wood sawing machine. When completed it will be a wonder."—Lisbon correspondence Lewiston (Me.) Sun

Suspending the Scorchers' Licenses.

Aided by the Safe Roads Association which brought cases to its attention, the Massachusetts Highway Commission recently visited summary punishment upon a number of speed law violators. Licenses were taken away from three offenders..

ALCOHOL A DREAM UNREALIZED

Why It Cannot Yet Compete with Gasolene as Fuel—Elements Contributing to the Cost of Production.

Quite in contrast with the roseate picture painted a year or so ago by the advocates of the then new "Free Alcohol" measure, the present status of the denatured alcohol situation is far from encouraging. Neither in its effect upon supply or demand has the removal of the impost on the denatured product come up to the importance which was predicted for it. The manufacturers who create a constant demand for alcohol in the processing of their output, have fallen into line and after a period of more or less heated conflict with the authorities, have settled upon formulas for denaturing which do not conflict with the demands of the operations in which the fluid is used. Apparently, however, no material increase in the demand for commercial alcohol has yet been brought about, and in that respect practically the only effect of the law has been to effect the substitution of denatured for the unaltered spirit formerly employed.

The tremendous demand for denatured alcohol to be used for industrial purposes apart from those in which its use was already extensive, has failed to materialize. The overwhelming inrush of alcohol motors which was predicted has altogether missed fire. As excusing this, two reasons have been assigned by those who have carried out experiments with the new fuel. In the first place, the thermal utility of the denatured product proved to be by no means as great as had been expected, at least when judged on the basis of present methods of use in the motor, so that the gain effected by using alcohol instead of gasolene is at present very slight, even when judged wholly apart from the question of its cost. In the second place, the expected reduction in the cost of alcohol not having developed, the verdict has been given by standard authorities that little if anything is to be gained by pushing the alcohol motor until such time as a marked increase in the rate of production and improvement in the processes incident to its manufacture shall have served to reduce its cost to the consumer. This being the case, the responsibility for the present rather discouraging state of affairs is being shifted about. The would-be consumer of a year ago blames the expected-to-be-producer, while the latter unloads the responsibility on the makers of distilling apparatus who, it is claimed, have failed to offer cheap and economical processes and machinery to the common or garden variety of producer.

The annual report of the Commissioner of Internal Revenue, just issued, reveals the surprising fact that since the passage of the bill, just ten stills have been set up for the purpose of manufacturing free alcohol, and further, that the cost of production has been far greater than was promised. Farmers have received from the Treasury Department pamphlets telling them how to manufacture spirits, but thus far the refuse turned into live stock has appeared to offer better returns than the production of denatured alcohol promises to give.

In press dispatches from Washington, Col. Newell Sanders of Chattanooga, Tenn., President of the National Association of Agricultural Implement and Vehicle Manufacturers, is quoted as saying that the people of this country will have to learn frugal methods before the law will benefit them.

"In order to manufacture the alcohol cheaply, all forms of vegetable and waste matter must be utilized," he remarks. "The manufacture of denatured alcohol is said to be successful in Germany, but in this country we have not learned such thrift as is practiced over there."

Manufacturers of appliances for the use of spirits, oils, and gas have taken little interest in industrial alcohol as a motive power. Very few appliances have been offered to the public for its use. At the recent Jamestown Exposition there were a few motors which used the alcohol, but little is thought to have been gained by the limited supply.

Internal Revenue Commissioner Capers ascribes the relatively greater cost of production, as compared with gasolene and kerosene, and the lack of proper appliances for its use as reasons for the slow growth of the propaganda.

"As understood by this office, various types of alcohol lamps, heaters, and motors are in successful use in Germany, and to encourage the manufacture and use of industrial alcohol the Government of Germany not only offers inducements to growers of potatoes from which the alcohol is manufactured, but imposes an impost duty on petroleum and petroleum products," says the Commissioner.

"Under this system, there are about 70,000 farm distilleries in Germany producing industrial alcohol, which is sold to consumers for about 27 cents a gallon. In this country the average price of denatured alcohol in barrel lots has been about 36 cents per gallon.

"While these distilleries are now permitted to use any material whatever in the production of industrial alcohol, the alcohol so far manufactured has been produced mainly from corn, and until a cheaper material is found and its practical use demonstrated it may be doubted whether this class of alcohol can successfully compete with gasolene or kerosene in this country."

BUYER ALLEGED HE WAS SOLD

Payment for Second Hand Automobile Resisted—"Horse Trade" Tactics Charged in Defense Against Suit.

That the automobile is superseding the horse, even to the extent of breaking into court and stealing its laurels there, was emphasized in the Supreme Court Circuit in Newark, N. J., last Thursday at the trial of a suit brought by Byron S. Klotz against William D. Slater. Klotz sued to recover $500 on a note given by Salter, May 25, 1905, and it was in explanation of this transaction that Salter based his defense.

The note transaction was admitted at the outset of the case and the plaintiff was not obliged to put in any evidence as to it, further than that the note had originally been given to J. B. Thompson and indorsed by him to Klotz, who had tried to collect on it and failed. Salter bought an automobile from Thompson. The car was represented to him, he said, as being worth $8,000, but he expressed no astonishment when told he could buy it for $2,500. He did so, paying $2,000 in cash and giving Thompson the note for the balance.

It did not take Salter long to find out, he declared, that the note had been secured from him by "fraudulent representations and so his lawyer outlined in opening the defense to the jury. It was testified that the machine "worked well for a time," but was soon found "not to be worth $1,000," "was in bad order," "out of repair," "its sprockets were broken," "its carburetter wouldn't work," and other complaints of a like nature.

Most of the court's time was taken up by automobile experts, who passed judgment on the worth of certain parts of the machine, which were offered in evidence Broken sprocket wheels were exhibited, and one witness went into a long explanation of the amount of wear these would sustain in being used on a car that traveled a thousand miles. The same was done as to the wheels of the vehicle, and further testimony was given as to the relative value of different automobiles.

Malcolm MacLear, who represented the plaintiff, objected to much of this line of evidence on the ground that it had nothing to do with the claim that Mr. Klotz possessed an unpaid note of Salter's for $500.

Among the wood products of western Australia one known as "yate" has been shown by recent official tests to have extraordinary tensile strength. The average was 24,000 pounds to the square inch, and one specimen was tested up to 17½ tons to the square inch, which is equal to the tensile strength of wrought iron. The yate tree grows to a maximum height of 100 feet and a diameter of 2½ or even 3 feet.

NEW TAGS IN MASSACHUSETTS

Radical Change in Design Adopted to Make New Registration Effective—Old Licenses Expire January First.

New registration and new number plates will be in order for automobilists in Massachusetts on and after the first of January. On that day the provision of the new registration law becomes effective, the law stating that "the registration of every automobile or motorcycle shall expire upon the first day of January in each year."

To prevent the operation of motor vehicles illegally, the Highway Commission has adopted an entirely new number plate. The present plate has white figures on a blue background. In the new plate this arrangement is reversed, the figures being blue and the background white. The new plate also bears the numerals "1908" and the letters "Mass." The new plates will be easily distinguishable from the old even at a distance, and it is thought by some that they will be more easily read. The new certificates will be practically the same as the present except that they will have the numerals "1908" conspicuously displayed.

Heretofore the Commission has permitted the renewal of old numbers, but it will be unable to do this except to a limited extent when the new registration begins. There have been issued about twice as many sets of plates as there are automobiles in the State. Concerning this matter the Commission has issued a statement in which it says:

"A new style of register number-plates has been adopted by the Commission for use in 1908, and a new series of register numbers, beginning with No. 1, is to be issued. A person to whom a register number below the number 5,000 was originally issued will be reassigned his former number for his use in 1908, provided he makes a specific request for the reassignment of such number, and provided also that his 1908 application is received on or before January 15. This arrangement will apply only to numbers below 5,000."

After the fifteenth of January, if all the numbers below 5,000 are not taken up by the original holders, the numbers remaining will be assigned to other applicants. It is believed that many of the lower registrations have lapsed and this will give those who wish an opportunity to secure low numbers for their car next year. After the old numbers below 5,000 have been reassigned or taken up by others the Commission will begin the issue of numbers from 5,000 up. An order has been placed for 14,000 sets of plates and it is believed that these will be sufficient for the demands which will be made by present owners of machines.

It is stated as examples of the attachment of owners to their old numbers that when the registration law first became effective there was much competition for the number "13"; one Massachusetts man has retained possession of the number "1" for years; and there is another who owns a number of cars and insists on having certain combinations of numbers on all his cars. It is said that he has a telephone number with the same combination. The scheme aids remembering his numbers.

For dealers the number plates are supposed to have a distinct advertising value. The owner of 01 is the Harry Fosdick Company; the Columbia Vehicle Co. has 02, the General Electric Co. 03, the Locomobile Co. 04, the Pope representatives 05, and so on. The concerns that have the low numbers will be able to keep them next year if they apply in time, though some of the dealers who have entered the business recently and who have high numbers probably will be obliged to make a change. The new plates will be similar to those of private owners except that preceeding the number will be a cipher, while following it will be a letter, as "07A," which marks car A of the White Company, or "07B," which means car B of the same company. Dealers need not carry these letters with the numbers which are placed upon the lamps of these machines, the Highway Commission having decided that the number alone is sufficient.

Palatial Club House Planned.

When the Royal Automobile Club takes possession of the new club house which it plans to build in London it will have the finest club house in Europe. It will occupy the site of the old war office on Pall Mall, a lease of which has been secured from the Crown. There is a frontage of 228 feet on Pall Mall and a depth of 145 feet. The club house will occupy the entire frontage and extend back 120 feet, leaving a space 25 feet deep for a garden.

Under the elase the club is bound to erect a building to cost not less than $500,000. It is stipulated that the material shall be Portland stone. The plans contemplate a thoroughly up to date establishment with gymnasium, swimming and Turkish baths, and a dining room to seat not fewer than 200 or 250 persons. If possible bed rooms to the number of 150 will be provided for the use of members.

Schenectady Retains Old Officers.

Although small numerically the Schenectady (N. Y.) Automobile Club will start its first fiscal year with the consciousness of having done good service in placing signboards at crossings, furthering good roads work and promoting club tours. At its annual meeting last week, the treasurer's report denoted a balance of $142.60. The incumbent officers were re-elected and H. S. DeForest, H. Earl Furman, Edward F. Peck, George H. Close, and F. R. Champion named a committee on good roads.

BUFFALO CLAIMS BIGGEST CLUB

And Deposits a Nest Egg for a Building Fund—Frank B. Hower Elected President for Ensuing Year.

Naturally, members of the Automobile Club of Buffalo, N. Y., swelled with pardonable pride at the annual election of that organization last week. They had reason for doing so as the club is now the largest in the country, and the largest vote in the history of the club was cast for the single slate of officers reported by the committee on nominations.

President Seymour P. White reviewed the accomplishments of the year before he relinquished the chair to the president elect, Frank B. Hower, chairman of the touring board of the American Automobile Association, and the treasurer's report showed that the receipts of the club last year were $9,027, and disbursements, $5,670, leaving a balance of $3,357, of which $2,500 has been laid aside as the nucleus of the country club house fund. Among the other speakers were President Hotchkiss of the American Automobile Association, and Edward Butler, who has served five years on the board of governors, and was re-elected in the same capacity.

The officers for the ensuing year are: President, Frank B. Hower; vice-president, John M. Satterfield; treasurer, Laurens Enos; secretary, Dai H. Lewis; directors, E. R. Thomas, Edward H. Butler, Charles Clifton, James N. Byers and George C. Diehl.

Chicago Club Officers Re-elected.

The Chicago Motor Club, at its annual meeting last week, re-elected all its old officers, as follows: President, F. C. Donald; first vice-president, Walter Githens; second vice-president, Edward Rowan; secretary, George Greenberg; sergeant-at-arms, O. E. Temme; assistant sergeant-at-arms, J. C. Zimmerman; directors, C. R. Root, J. V. Lawrence, David Beecroft, H. P. Branstetter and Carl J. Metzger.

Wachusett Club Officers for 1908.

At the annual meeting of the Wachusett Automobile Club, held in Fitchburg, Mass., last week, the following officers were elected for the ensuing year: President, Charles B. Smith, Fitchburg; vice-president, Arthur H. Hall, Leominster; secretary, General Greenwood, Gardner; treasurer, Geo. P. Grant, Jr., Fitchburg.

Hillenbrand Heads Cincinnati Club.

The Cincinnati (Ohio) Automobile Company has elected the following officers: President, Ray J. Hillenbrand; vice-president and general manager, H. O. Brunton; treasurer, A. J. Hillenbrand; secretary, H. W. Hillenbrand.

The Week's Patents.

865,964. Rotary Engine. Warren F. Bleecker, Victor, Colo., assignor of one-third to Frederick G. Bleecker, Grand Island, Neb., and one-third to Martin C. Bleecker, Pueblo, Col. Filed March 17, 1906. Serial No. 306,568.

A rotary engine comprising a motive casing, an abutment therein, a tubular shaft extended into the casing and having a port, a radial wing at one side of said port, a tube extended into the hollow shaft, and having a port, a ported tube having rotative movement on the first-named tube, a rod, an arm on said rod, a link connection between said arm and the rotary tube, a governor for causing movements of said rod, and a driving connection between the governor and the shaft.

865,967. Rotary Engine. John E. Hartiman, Jr., Brookline, Mass. Filed Feb. 12, 1906. Serial No. 300,552.

1. A rotary engine or motor comprising a rotary member forming the inner walls of a working chamber, a shaft affixed to and driven by said member, a fixed inclosing structure which completes said chamber and has inlet and outlet ports therefor, automatic means for opening and closing the said inlet port to intermittently admit a working agent to the said chamber, and means carried by the rotary member and the inclosing structure, to co-act with the working agent in imparting movement to the rotary member, and controlled by the working agent so as to be put thereby into pressure resisting relation.

866,001. Sparking Mechanism for Internal Combustion Engines. Leslie S. Cushman, Lincoln, Neb. Filed June 3, 1907. Serial No. 377,102.

In apparatus of the class described, a box or casing, contact plates arranged therein, one adapted to be connected to the terminal of a sparking circuit, and the others to the terminals of the sparking plugs, a shaft mounted in the casing, a rocker arm carried by the shaft, a contact plate carried by the arm and insulated from the shaft, said contact plate being constantly in engagement with the terminal of the sparking circuit, and mechanism for rocking the shaft to move the plate alternately into engagement with the contact plates of the plugs.

866,009. Tire. William I. Dreisbach, Williamsport, Pa. Filed Sept. 15, 1906. Serial No. 334,758.

1. In a tire, the combination with an outer casing, of a puncture resisting cushion located inside the same and comprising a strip wound longitudinally upon itself into a plurality of convolutions, one overlying the other, said strip consisting of sections disposed end to end, the end of one section being secured to the end of the next.

866,133. Vehicle Steering Gear. John A. Herzog, Toledo, Ohio, assignor to The De Luxe Motor Car Co., Detroit, Mich. Filed June 15, 1907. Serial No 379,121.

1. A steering gear comprising a pair of casing halves united by a vertical joint and

having post bearings in its upper and lower walls and a slot in the joint between its halves, trunnion bearings carried by the casing halves at the opposite sides of said slot, a steering post journaled in the post bearings, a worm on the steering post within the casing, a worm gear sector engaging the worm and having a hub engaging the sides of the casing slot and having its upper and lower concentric portions engaging the upper and lower margins of the slot, trunnions projecting from said hub into engagement with the trunnions bearings, and a steering arm projecting from the hub exterior to the casing, combined substantially as set forth.

866,134. Tire Protector. William H. Hoffmann, New York, N. Y. Filed Nov. 18, 1905. Serial No. 287,981.

1. A tire protector, composed of a series of shoe sections substantially V shaped in cross section which shoe sections are provided in each side edge with a notch at the center of the shoe and extending inward from the side edge, a pivot pin extending through each notch near its outer end and links mounted slidably on the pivot pins of two adjacent sections and extending in the direction of the length of the tire protector formed of such alternate link and shoe sections, substantially as set forth.

866,164. Transmission Gearing. George J. Sogge, Hanson, S. D. Filed May 31, 1906. Serial No. 319,542.

1. In a transmission gearing the combination of a shaft, a case rigid with the shaft, a series of gear wheels loosely mounted upon the case, a driven member having an operative connection with one of the gear wheels, a brake drum having an operative connection with one of the gear wheels, a second brake drum having an operative connection with one of the gear wheels, means for moving one of the brake drums into engagement with the opposite brake drum whereby the two are locked together, and means for locking the brake drums in a fixed position.

866,186. Variable Speed Friction Mechanism. Alanson P. Brush, Detroit, Mich. Filed Oct. 20, 1906. Serial No. 339,883.

1. A friction speed mechanism to obtain varying speed ratios comprising a friction disc made thicker toward its center than at its periphery, friction rings contacting upon opposite sides of the friction disc, and means to bring the centers of rotation of the friction rings and the friction disc into and out of alignment.

866,192. Spring Wheel. Leopold J. Castiau, Strathcona, Alberta, Canada, assignor of one-tenth to Charles F. Hover, Conrad, Mont. Filed Nov. 12, 1906. Serial No. 343,051.

1. In a wheel, the combination of a spoke comprising adjustable sections, an adjustable cylinder slidably mounted upon one of said adjustable sections, and yielding means between a member of said adjustable cylinder and a member of the adjustable sections.

866,202. Transmission Gearing. Enos M. Hostetter, New Providence, Pa. Filed May 24, 1907. Serial No. 375,460.

1. The combination of a plate having an opening formed therein, a shaft carried by the plate and extending through the opening, a pair of pinions mounted upon the shaft and rigid with each other, a gear wheel mounted upon one side of the plate and meshing with one of the pistons, and a second wheel mounted upon the opposite side of the plate and carrying a toothed flange meshing with the opposite pinion.

866,297. Pneumatic Tire. George Noyes, Mandan, N. D. Filed Dec. 4, 1905. Serial No. 290,253.

In combination with a pneumatic tire comprising an inner and outer tube, a shield having opposite ends inserted between the tubes and composed of a strip of flexible elastic material crescent shaped in cross section and a strip of metal which is flat in cross section embedded in the flexible material, the arrangement and contour of the parts being such that gripping angles of contact between the inner tube and the edges of the shield will be formed in the said tube when inflated whereby the shield is retained against lateral movement between the tubes, said shield having its ends oppositely inclined and overlapping each other.

866,328. Brake Mechanism. Alanson P. Brush, Detroit, Mich. Filed Aug. 31, 1906. Serial No. 332,781.

1. A brake mechanism comprising a rotatable brake drum, an unattached friction band within the drum having both extremities formed with wedge shaped faces, a fixed stop between the ends of the band, and means to be forced between the ends of the band to force the band against the drum, whereby the brake will be set in either direction.

866,367. Vehicle Wheel. Curt von Kusserow, Lubbecke, Germany. Filed Jan. 26, 1906. Serial No. 298,035.

1. In a wheel, the combination of a hub and felly, of radially movable spokes interposed therebetween, and means for forcing the ends of said spokes into frictional association with said felly and said spokes being unlimitedly displaceable circumferentially of the felly, and means opposing said displacement by a resistance varying with the amount of said displacement, substantially as described.

866,397. Speed and Distance Indicating and Recording Device. Richard H. Smith, Springfield, Mass., Filed Dec. 14, 1906. Serial No. 347,833.

1. The combination with a drum and means for confining a record sheet in supporting engagement upon and around it, and a clockworks having a rotation imparting connection with the drum, of a speed indicating device comprising an indicator casing having a slotted front, a centrifugal governor comprising a vertical stem, having its upper portion between the slotted front and drum, endwise movable in degree proportionate to the speeding of the governor, a vertically apertured head, rotatively loose, but endwise immovable, relatively to the upper extremity of said stem, provided with a transverse stud, projecting through the slot of the indicator casing, said stud having a pointer movable on the face of the scale card, and said head also carrying at its side opposite said stud a return bent spring arm provided with a marker for operating against the drum carried record sheet simultaneously with the coaction of the pointer with the scale card.

866,410. Driving Mechanism for Automobiles. George R. Walker, Chicago, Ill. Filed Oct. 1, 1906. Serial No. 337,005.

1. In a driving mechanism, the combination of a traction wheel provided interiorly with a gear rigidly mounted thereon concentric with its axis of rotation, a drive shaft journaled in alignment with the axis of the traction wheel, extending within the wheel and carrying a pinion, a yoke constituting an axle-support upon which said traction wheel is journaled, provided within said wheel with radial extensions and a plurality of intermediate gears interposed between said pinion and the internal gear and meshing with both.

866,765. Clutch. Severin C. Anker-Holth, Riverside, Ill. Filed Sept. 4, 1906. Serial No. 333,188.

1. A clutch having a pair of relatively rotatable main clutch members, friction shoes movable into and out of securing frictional engagement with one of such main clutch members, and a plurality of levers each in engagement with a plurality of such friction shoes and with the other main clutch member.

866,776. Reversing Mechanism. Albert P. Creel, Ionia, Mich. Filed June 5, 1907. Serial No. 377,459.

1. In a reversing mechanism, a base plate having boxes thereon, a driving shaft and gear revolubly secured thereto, a shaft mounted to revolve in the boxes at right angles with the driving shaft, two gear wheels revolubly mounted on the second shaft between the boxes and engaging the driving gear at diametrically opposite points, a clutch mounted on said shaft between the gear wheels and arranged to engage each alternately, a spline in the shaft to revolve the clutch with the shaft, said shaft having a screw thread at one end, a nut actuated by said screw thread, a sliding plate, a latch, a trip, and springs arranged to actuate the clutch longitudinally of the shaft.

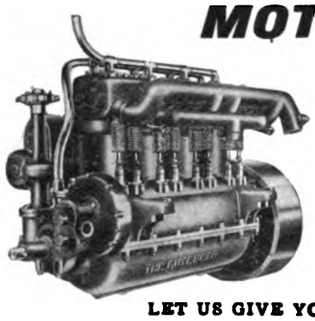
866,874. Tire. Joseph E. MacKay, Los Angeles, Cal. Filed Jan. 23, 1907. Serial No. 353,745

1. A tire comprising a circular woven wire element, a series of elastic blocks engaging in the meshes of the woven wire element, and a tread encircling the blocks.

866,908. Driving Gear for Motor Vehicles. Charles R. Binney and James L. Watkins, London, England. Filed March 21, 1907. Serial No. 363,981.

In combination, a frame, a driven shaft carried thereby, an eccentric mounted on said shaft, a disc rotatably carried by the frame, said disc having a cam groove in one of its faces, a rod on the eccentric, an arm pivoted to the rod and to the frame, a roller carried by the arm to one side thereof intermediate its pivots to engage the cam, and additional means for rotating the driving shaft acting in conjunction with the opposite face of the disc.

866,926. Hydraulic Clutch. Arthur J. Fippard, London, England. Filed March 18, 1907. Serial No. 363,043.



1. A hydraulic clutch comprising driver and follower members, an annular recess in one of said members, blocks fitting said recess and connected to the other member, means for causing relative motion of said blocks within said recess, and means for causing a variable resistance to said relative motion.

866,927. Tire. Robert A. Gehan, Buffalo, N. Y. Filed Dec. 18, 1905. Serial No. 292,146.

1. In a wheel, the combination of a continuously coiled spring of substantially the same diameter throughout its length, a felly entirely surrounded and enclosed by said spring, spokes secured to said felly, and means for clamping the coils of said spring against the inner periphery of said felly to hold said spring in position and prevent endwise movement thereon, substantially as described.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

The Largest Automobile Supply House in America

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches, leaves the automobile with its original new lustre, without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish, from the clearest white to the darkest black.

Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all automobile dealers. Price, 60 cents per bottle.

Catalog, largest of the kind, mailed on request.

Garford

The Garford Car bases its claim to attention on the fact that it aims to be orthodox in every essential. We have no "1908 Model." We had no "1907 Model." The present Garford, may be, if you please, our 1909 Model and our 1910 Model. There is not in the whole chassis a single feature that has not been proven correct. There is no freak device to become obsolete after its potentiality as a selling point has been exploded.

The Garford Car may advance with the automobile industry, and when safe, anticipate that advance, but not depart from it; but the Company protects its customer by its policy of conservatism, never departing from the type and never changing in essential features except as the "TYPE" itself changes.

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

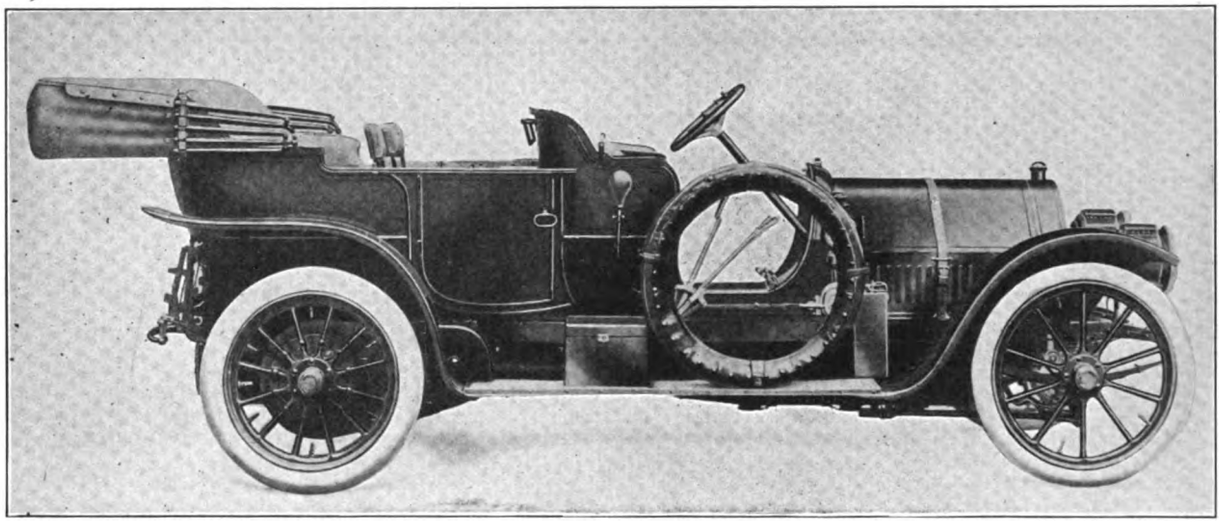
A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running, on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.



E. R. Thomas Motor Co.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exigencies of street traffic without any changing of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

The Anti-Fatigue Car

It never grows weary of well doing. All are beginning now to realize what the users of it and its builders always have known—that the

American Locomotive Motor Car

is the "greatest touring car in the world, bar none." Tourists boast that with this machine they can always keep their schedule and those who have driven it farthest, say:

"IT STAYS NEW"

Imported Materials. American Workmanship.

Vanadium, "the anti-fatigue metal," is in ALL its steel and iron.
What lasts best, *is* best.

The energies and backing of a $50,000,000 company are behind it.

'Keep Your Eye On Continentals!"

Continental TIRES

"Ready-Flated" Tires. These tires are the sensation of the season. They are carried already inflated on Continental Demountable Rims, ready for instant use in replacing a tire that is punctured. Exhibited at the Importers Salon, New York. Can also be seen at any of our branches or agencies or at dealers in motor supplies throughout the country.

"Rouge-Ferre" (Anti-Skid.) This is the standard Anti-Skid Tire of the world. Steel studs with rivet heads are embedded in the tread during the process of manufacture, and are so firmly held in position that they cannot work loose or be torn out. Cars equipped with these tires are guaranteed not to skid under any conditions. These tires can be used in parks and on drives and boulevards where chains are prohibited by the local authorities.

New Prices. Continental Tires are offered this season on a new schedule of prices more favorable to the purchaser than any previously made by us. The immense volume of business that has come to us from our branches all over the world enables us to manufacture with greater economy without lowering the quality of the tires. Continentals are known as "the low cost per mile tires." They have a larger sale than any other tire which is some indication of the way they are regarded by motorists generally.

TO AUTOMOBILE MANUFACTURERS

AND TIRE BUYERS IN GENERAL

Before you let "Stand Pat Dust" get into your eyes, consider just what the "standpatters" stand pat on, and are they "standing pat"?

Are you paying for "definite policy" tire quality without a guarantee that you are getting it?

Think it over and keep your eyes open.

Automobile manufacturers cannot force us to reduce the quality of

AJAX
WRAPPED TREAD
TIRES

On the contrary, our 5,000 mile guarantee forces us to uphold the quality.

We shall meet competition in the future as we have in the past, by making the best tire possible, backing it by the best guarantee practicable and selling it at a margin of profit that will allow us to remain permanently in the tire business.

Ajax Tires will continue to uphold their

GUARANTEE OF 5,000 MILES RIDING

and it naturally follows that to uphold that guarantee, they must uphold their quality, and to uphold that quality they must uphold their price.

Take your choice, gentlemen.

The policy of "stand pat" in public, without the guarantee that certifies to standing pat in private, or—

The policy of a "square deal" with a guarantee that makes square dealing a logical certainty.

HORACE DE LISSER, President

The Man Who Drives *The* "Maxwell"

knows what it is to experience all the pleasures of motoring without that eternal "gnawing at his bankroll" as is the case with a high-priced, costly-to-operate car.

The little overdose of prosperity which resulted in the recent stringency has waked a lot of people to the fact that motor-car money's worth does not go hand in hand with fancy horse-power and exaggerated claims.

The "Maxwell" has never been a speed-car or a freak. It has never boasted hyper-horse-power.

It is, and has always been a utility—a necessity—a family car without a "frill" in its construction.

The records it has established in hill-climbs, economy and endurance tests have never been equalled by any other cars, regardless of price.

Mr. J. D. Maxwell's foresight in designing cars of unfailing efficiency, at prices well within the reach of the average citizen has been well rewarded, to judge from the universal satisfaction of the 10,000 "Maxwell" owners.

That is why these days are "Maxwell" days. Every motor-car buyer will now get a dollar's worth of motor-car for every dollar he pays, and that is just what the "Maxwell" has always given.

Among the important features which the "Maxwell" was the first to introduce, are the three-point suspension, thermo-siphon cooling and multiple-disc clutch.

That features of such prime importance should have first appeared on cars of such low price—$825 for the 14 H. P. Tourabout, $1,450 for the 20 H. P. Touring Car, and $1,750 for the new four-cylinder 24 H. P. Touring Car—is one of the most remarkable incidents of the industry, and is evidence of how far in advance the "Maxwell" line is.

Get a "Maxwell Convincer" at your convenience in any car of the "Maxwell" line. Address Dept. 2.

THE CAR OF STEADY SERVICE

Rambler Model 34-A, $2250

A CAR THAT HAS BEEN TRIED AND PROVEN RIGHT

In the Chicago Motor Club's Reliability Run one stock car of this model entered and went through the three-day grind of 630 miles and finished in perfect condition with every seal intact and every part working as smoothly and steadily as at the start, thus proving itself from every practical standpoint

A PERFECT CAR

In this and the touring car of same chassis design is every modern feature of mechanical value, such as offset crank shaft, straight line drive, roller bearings throughout the transmitting mechanism and other features of equal value.

The price, $2250, for either model, is made possible by the complete facilities and volume of output of the Rambler factory.

Why pay $5000 for a car when we offer every dollar in actual value at less than half that price.

Let us show you; a demonstration will convince.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, January 2, 1908. No. 14.

SHOW MAY BLOOM IN THE SPRING

Metropolitan Automobile Dealers Didn't Know They Were to Hold One—But Details Have Been Arranged.

The "Metropolitan Automobile Dealers" will, or rather may, hold their "first annual spring show" in New York during the week April 6-11, 1908.

Apparently the dealers themselves are not aware of the fact, but a trifling circumstance of the sort is of small importance. For not only have the dates been fixed but the hall—the Metropolitan skating rink at Broadway and Firty-third street—appar- has been engaged, 23 spaces have been plotted and of course the price therefor has been fixed—only $250 for the large spaces, $200 for the smaller ones. Rules also have been adopted, that is, printed.

The "show prospectus," giving the foregoing details, made its appearance this week as quietly as a summer's sigh. It was the first that many of the metropolitan automobile dealers knew of the show in which they are supposed to be interested. According to the prospectus, C. Wood Tatham is general manager of the project, and Duncan Curry, the treasurer. Tatham was the manager of the show and "auto carnival" held in Atlantic City last summer, but who for some reason or other was displaced at almost the eleventh hour. He came to New York and mixed with the large colony of genial and enterprising spirits who have their nests in the Spalding building on West Forty-second street, in which so many "good things" have been hatched; he became so touchingly acquainted that some of them are not now so cordial in their expressions of regard as once was the case. Duncan Curry is automobile editor of Hearst's American and his "doubling up" with Tatham has caused some little surprise and comment.

That the promoters of the "first annual spring show" were somewhat in doubt as to the dates for the affair is made evident by their prospectus, which was printed in blank and the dates filled in afterward in ink.

When inquiry was made of Alfred Reeves, general manager of the American Motor Car Manufacturers Association, he stated that he had heard whisperings that a "show" of the sort was in contemplation, but he was not aware that dates had been fixed or that a prospectus was in existence. His remarks conveyed the impression that he did not accept the project with too much seriousness.

E. V. Stratton, manager of the New York Automobile Trade Association—the local dealers' organization—knew nothing whatever of the enterprise and naturally his association had not taken cognizance of it, nor did he think it would do so. For some time the association has had under consideration the holding of a "sales week" or "open house" early in the spring and Stratton did not think anything would be permitted to interfere with the carrying out of that idea.

Shelby Shifts Sales Department.

Henceforth the Shelby Steel Tube Co., as such, will to all practical purposes, cut little or no figure in the business, the Shelby sales repartment having been taken over by the National Tube Co., of which Clifton Wharton is the sales manager. The change, however, will be more apparent than real as the Shelby Steel Tube Co. is merely one of the units of the National Tube Co., and save in respect to the sales departments, the line of demarcation between them has been rather vague. Hereafter the business will be dircted from New York, where Mr. Wharton is located, instead of from Pittsburg as heretofore.

Hutton with the Thomas Detroit.

W. H. H. Hutton, who for five years was purchasing agent of the Northern Motor Car Co., and who more recently managed their Port Huron factory, has engaged with the E. R. Thomas Detroit Co. He will be attached to the purchasing department.

BRITONS SCARED BY A BUGABOO

An Alleged American "Melon" Operates as a Bomb—Professions of Patriotism Punctured by the Explosion.

Great Britain is reveling in a trade sensation with what might be termed an American underpinning. While the underpinning appears to be rather weak it has given Britain's native sons in the automobile trade a grand opportunity to proclaim their love for the British public and the British workman, though their proposals for giving practical effect to their altruism differ so widely that a glorious row has been precipitated. It all comes about through the hair-trigger patriotism of that Harriman of the British motor trade, Harvey Du Cros, who stands as a repeller of the hated American products and who has made a denunciation of the importers who invited him to participate in a melon cutting based on the "American panic."

The first explosion was set off when Du Cros made public a letter written him by Shippey Brothers, a London wholesale importing firm making a specialty of American goods, and with it his grandiloquent reply. The Shippey letter recited that "many American motor car companies are on their beam ends through the financial crisis now raging in the United States," and that the "Official Liquidator" of the Pope Manufacturing Co. was prepared to sell "thousands and thousands of stock on hand at panic price." Not only had the Shippeys bought a number of cars at exceedingly low figures, the letter went on, but they had arranged for options on $200,000 worth more which could be imported in time for the spring season if Du Cros wanted to help finance the scheme, The cars could be sold for 50 per cent. under the list, they said, and there was a "pot of money to be made." In conclusion, Shippey Brothers desired that Du Cros understand "that this proposal is

Digitized by Google

made to you privately, knowing your power in the motor world; it may, therefore, answer your purpose to control it or crab it as you may desire."

Du Cros responded in the most lofty vein that while the offer was made to him privately, he declined "to be privy to any such transaction" and that he intended to give warning to the public and the British industry. His full reply was sent to the trade papers and dailies together with a copy of the original Shippey letter. After telling of his former alleged refusal to assist in a dumping of American bicycles in the English market, Du Cros, who declares he "has spent some of the best years of his life in developing the automobile industry," expresses his declination of the offer and hopes that "no Englishman will be found willing for the consideration of a 'pot of money' to join in such an attempt" as Shippey Brothers proposed "to dump American automobiles at ruinous prices to the detriment of the nascent English automobile trade."

Rounds of epistolary and editorial applause greeted Du Cros as a result of his letter thus spurning the horrid American offer in the manner of the Billy Baxter heroine who declares that "rags are royal raiment when worn for virtue's sake!" Here was one who set the welfare of the British industry above the opportunity for personal profit.

But Shippey Brothers were not to be thrust into the role of villains in the melodrama. When their "private" offer was made public with the scathing refusal, they affected to see in the latter less altruism than a desire on the part of Du Cros to discourage competition against his own enterprises of importing cars from Italy, France, Germany and Belgium into the English market. Further they were bursting with altruism themselves. This they set forth in a long letter explaining how their proposed importation of "panic" cars from America would benefit the English workman and the public. Their object in undertaking the enterprise, according to their letter, was as follows:

"(a) The employment of English chauffeurs to run these cars on our behalf;

'(b) To give English engineers repair work on all cars imported, as we have always done on the large number of American cars sold by us in this country;

"(c) To utilize British capital to profitable advantage in a safe paying business for all concerned;

"(d) And above all to check the flow of many systems of Continental cars to work which importers also import Continental labor to drive and repair them."

Manifestly whatever difference arose between Du Cros and themselves was due, apparently, to a competitive eagerness to be of benefit to the British trade. With the English propensity to ease themselves by the inditing of communications, everybody has taken a hand at spattering ink in the discussion and the thing has run riot to a point where at last it has occurred to a few of the cooler heads to inquire whether there is any real basis for the turmoil and how far Shippey Brothers' tensely drawn representations of American conditions match the facts.

Going right to the heart of the matter, a letter signed by Percival D. Perry analyzes the Shippey proposition in part as follows:

"The new proposal emanates from a firm whose projections I venture to think should not be taken too seriously, and in confirmation of this view, I desire to query certain statements contained in a letter addressed to Harvey Du Cros, Esq., dated the 4th December and signed by Shippey Brothers.

"Therein it is stated, 'The —— company has failed for over four million sterling, and have thousands upon thousands of stock upon hand, which in the panic the Official Liquidator is prepared to sell at panic price.' Presumably the —— company is the Pope Manufacturing Co.; if this be so, then the figures stated in the said letter are quite inaccurate. Indeed, the above quoted paragraph is so loosely strung together that we are not told whether the thousands upon thousands of 'stock on hand' means thousands upon thousands of automobiles, or thousands upon thousands of dollars worth of automobiles, or thousands upon thousands of pounds sterling worth of automobiles.

"That there is a panic in the automobile business in America, I, having very carefully investigated the position, emphatically deny, but even if it were so, I fail to understand upon what authority Shippey Brothers can state 'the Official Liquidator is prepared to sell at panic price.'

"Can Shippey Brothers give the name of any company which is even in the hands of an 'Official Liquidator'?

"I think it would only be fair to the automobile industry if modesty or fear of advertising American automobiles had not compelled the numerous blanks throughout the letter of Shippey Brothers. Obviously, it is difficult to check and repudiate statements which are not precisely defined. I, however, have every reason to suspect the accuracy of the statement by Shippey Brothers that 'Our New York offices have purchased over £20,000 worth of cars, including fifty 35-40 horsepower touring cars . . . . . which we can sell at the price of £350.' Inasmuch as later, in the same letter, it is stated that cars listed at £675 to £700, that is $3,375 to $3,500, will be sold at 40 per cent. to 50 per cent. under value, i. e., £350 to £420, and the British sellers make a 'pot of money.'

"Now the production of American automobiles listed at $3,500 is strictly limited, and competition in the industry does not allow 50 per cent. profits, therefore the said cars, having to be sold at at least 60 per cent. off list, in order to provide the said 'pot of money,' could not be procured from bankrupt concerns.

"It is positively certain that there is, at the present moment, no bankrupt automobile concern in the U. S. A. which has on hand any number of finished cars such as Shippey Brothers threaten to dump into England.

"Most probably the communication of Shippey Brothers has obtained a good deal more publicity than was ever anticipated; however it is positively certain that there is no more danger of dumping by American automobile manufacturers than there is of dumping by French, German or other Continental automobile manufacturers."

If Shippey Brothers maintain an American office it is difficult to locate. None of the better known New York exporting firms are able to supply its address and extended inquiry has failed to reveal it. But their London letter indicates that they handle a number of well known American wares and the Motor World is in receipt of an invitation from them to "boom our ideas as much as you like," accompanied by a suggestion of "a slashing preliminary article." Like their letter to Mr. Du Cros, this communication is labeled "Private."

About thirty Pope-Toledos constituted the foundation for all the furore and flourish of trumpets. According to Albert L. Pope, of the Pope Mfg. Co., that number of those cars of the vintage of 1906 were on hand in November last, and to clear them, a special export price was set under option, which never was exercised. Since then, however, they nearly all have been disposed of on this side so that the quotations then given, having their possible English sale in view, have been cancelled. The officers of the company do not know of any arrangement for the export of Pope cars at "panic" prices, or anything suggestive of panic prices and are disposed to smile at the scare which the Shippeys threw into Mr. Du Cros and the British trade generally.

The Factory that Gauntt Bought.

The South Bend (Ind.) factory which N. C. Gauntt is to remove to Spokane, Wash., in the spring, proves to be the Perfection Automobile Co., which was first heard of at the Chicago show last month, where it exhibited one car. Gauntt, who is a Washingtonian, is authority for the statement that the Perfection plant employs 40 men and will need 100 when it locates in Spokane. Gauntt himself has designed a car with a convertible body that can be converted into a sleeping room, kitchen, etc., and for which he foresees a great future. He will style it the Flying Dutchman and expects to make 20 cars per month.

Thomas Adopts the Truffault-Hartford.

The E. R. Thomas Motor Co. finally have adopted the Truffault-Hartford shock absorber. It will be supplied as part of the regular equipment of all Thomas Flyers and six-cylinder cars.

The Week's Incorporations.

Boston, Mass.—Boston Taxicab Co., under Massachusetts laws, with $1,000 capital. Corporators—Warren N. Akers, Norman J. Mac Gaffin, Lawrence B. Pinckney.

Colville, Wash.—Colville and Metaline Transportation Co., under Washington laws, with $5,000 capital; to conduct automobile stage lines. Corporator—S. H. Anschell.

Lakewood, N. J.—Lakewood Garage & Machine Co., under New Jersey laws, with $100,000 capital; to deal in automobiles and maintain garage. Corporators—Joseph B. Hoff, William H. Housen, and R. E. Todd, all of Lakewood.

Kansas City, Mo.—Kansas City Automobile Dealers, under Missouri laws, capital not stated; to conduct automobile shows, etc. Corporators—Philip C. Dodderage, president; Charles F. Ettwein, vice-president; E. P. Morairity, secretary.

Rochester, N. Y.—Murphy Electricity Rectifier Co., under New York laws, with $1,000,000 capital; to manufacture electric charging apparatus. Corporators, Thomas J. Murphy, Walter B. Duffy, George W. Aldridge, Rochester; Richard Murphy, Amsterdam, N. Y.

New York City, N. Y.—Franco-American Taximeter Co., under New York laws, with $500,000 capital. Corporators—Louis Hesse, 154 Elm street, Elizabeth, N. J.; John Kochendorfer, 166 Magnolia avenue, Richmond Hill, N. Y.; and John J. Gallagher, 701 Union avenue, New York City.

New York City, N. Y.—Motor Car Touring Association of the City of New York, The, under New York laws, to promote touring. Corporators—Stuyvesant Fish, Jr., Orme Wilson and Albert E. Gallatin, New York City; Marshall R. Kernochan, Pittsfield, Mass.; Percy Yyne, 2d, Princeton, N. J.

Rainier Removes to New Home.

The Rainier Motor Car Co. this week took possession of its new home on the corner of Fifty-sixth street and Broadway, New York. Although the place vacated was built especially for the Rainier company a few years ago, it has been so far outgrown that the business is now distributed through three different buildings. In the new five-story headquarters all this business of salesrooms, offices, garage and machine shop will be gathered under one roof and the facilities for the company's policy of keeping customer's cars in repair will be greatly improved.

Good Outlook for Trade in Canada.

J. F. McLain, western sales representative for the Franklin company, reports that the most promising automobile field in the west this year is northwest Canada. Contracts twice as large as those of last year have been signed in the territories centering in Calgary and Victoria. The prospects for automobile business in western Canada, according to Mr. McLain, are better than in the Seattle and Portland region in the United States, in spite of a duty of 35 per cent. A number of ranch owners in the Calgary-Edmonton district are now using motor cars for their work.

New and Compact Recharging System.

Back of the Murphy Electricity Rectifier Co., of Rochester, N. Y., which, capitalized at $1,000,000, was late last week incorporated under New York laws, is said to be a recharging instrument or system, which is expected to practically revolutionize the cost and manner of recharging of electric vehicles of all sorts. The complete device, which is the invention of Thomas J. Murphy, is described as being "about the size of the ordinary typewriter and about a tenth of the size and about a twentieth of the weight of the apparatus usually employed to accomplish the same work." In addition to the inventor, the corporators of the company include Walter B. Duffy, a wealthy distiller of Rochester; George W. Aldridge, the up-State political boss and former State Superintendent of Public Works, and Richard Murphy, of Amsterdam, N. Y.

Hewitt Will Not Make Tires.

The Hewitt Rubber Co., which recently erected a large plant in Buffalo, and which was reported to be preparing to enter the tire business on an extensive scale, have abandoned all intentions of the sort. The Hewitt people admit that they made up and experimented with a number of automobile tires, but none will be marketed, as it has been decided to devote all efforts to the production of mechanical goods.

Hartford Changes Boston Location.

The Hartford Rubber Works Co. have removed their Boston business to larger premises in the Heard building, 817 Boylston street, which will be their only branch in Boston. They had been situated for six years in Atlantic avenue, and their reason for moving is to become more centrally located in the automobile district.

Studebaker Opens Two New Branches.

The Studebaker Automobile Co. have opened a branch salesroom in Cleveland for the sale of their electrics. It is located on Euclid avenue near Twentieth street, and Alvin H. Smith, formerly of the Central Automobile Co., is the manager. The Studebaker people are extablishing a branch in Boston also.

Wiedman Adjudged Bankrupt.

Henry C. Wiedman, of Detroit, who indorsed a large volume of the Detroit Auto Vehicle Co.'s paper and "went broke" soon after its enbarrassment, has been adjudicated bankrupt. The first meeting of his creditors has been called for Saturday, 7th inst.

In the Retail World.

George R. Tennant has been appointed receiver for the Northwest Motor Co., Seattle, Wash. The assets and liabilities are not stated.

The Kings County Automobile Co., Brooklyn, N. Y., has assigned. The company did a general garage business and handled the Glide car.

The Whitten-Gilmore Co., which will handle the Thomas line in Boston, opened its new salesrooms last week. The company is located in comfortable quarters at 907 Boyleston street.

Henry B. Hughes is preparing plans for a two-story brick garage to be erected on the south side of Tioga street, west of Sixteenth, Philadelphia. The building will measure 50x100 feet and will cost $10,000.

William Turnbull has just completed what is claimed to be the largest garage in Peoria, Ill. It is located at 225 South Madison avenue, measures 54x171 feet, and has storage capacity for upwards of 75 cars.

William Klockau, a wagon repairer of Rock Island, Ill., is preparing to "go into automobiles." He is building a two-story brick garage adjoining his present establishment and besides engaging in repair work will sell the Ford. The building will measure 37x40 feet, and its cost will be $5,000.

Craig-Toledo Trustee Sues Craig.

Joseph W. Lane, as trustee of the Craig-Toledo Motor Car Co., Toledo, Ohio, has instituted a suit for $18,000 against George L. Craig, vice-president of the company, in United States district court.

The trustee seeks to recover the difference between $2,000 held to be a fair settlement to a creditor and $20,000 allowed Craig in the form of eight Craig-Toledo automobiles at the time the company went into bankruptcy last June. The suit is based on the charge that Craig received a preference over other creditors of the defunct company.

Hathaway is Trustee for Dolson.

C. Roy Hathaway, of Muncie, Ind., has been appointed trustee in bankruptcy by the creditors of the Dolson Automobile Co., Charlotte, Mich. Mr. Hathaway furnished $25,000 bond and entered upon his duties at once.

New Maxwell Factory Soon to Start.

It is expected that the new Maxwell-Briscoe factory in Newcastle, Ind., will begin operations on January 15th. It is stated that orders have been given for the employment of 600 men.

Franklin's New Boston Manager.

H. G. Kilbourne has been appointed manager of the Franklin branch in Boston. Kilbourne is a mechanical engineer and has had long and varied experience as a salesman.

High Time for a Showdown.

It is known that Mr. Thomas Francis Moore possesses a map of the course over which at least he and Mr. Robert Lee Morrell propose to run a stock car race in April next. It is understood that permission to use the roads for the purpose has been obtained and last week the American Automobile Association issued a sanction for the race, not to any club or association, but to Mr. Morrell personally as "chairman" of an intangible something.

Meanwhile, either Mr. Moore or Mr. Morrell, or some of their helpers, are crying out that someone is seeking to undo their work or to render it more difficult, whatever that may mean. But before their cries can be heeded, it should occur to the men concerned that before full faith can be placed in either themselves or their project, they must, to employ expressive vernacular, "play on the level" and show their hands.

When this stock car road race first was exploited the so-called Metropolitan Automobile Association was its sponsor and service for sweet charity was its ostensible purpose. When the Motor World smoked out this so-called organization it was found to consist chiefly of Mr. Moore, whose vocation is that of press agent. Soon thereafter, the latter acquired Mr. Morrell as his "chairman" and since that time no more has been heard of his "association." But it is common report that the "chairman" has been paying the press agent a salary while he has been operating as the "Automobile Manufacturers Committee," which appears to have become sponsor for the race and which is to turn over any "surplus receipts" for "the benefit of the taxpayers of Westchester County." Throughout the whole mysterious proceedings, one feature has remained unchanged—the size of the entry fee. It still stands at $1,000.

There has been too much mystery connected with the whole movement; and where there is mystery suspicion is justified. The Motor World holds no disrespect for either Mr. Moore or Mr. Morrell and it is not opposed to a road race for stock cars under proper auspices. It may or may not prove of benefit to the industry. But when it is sought to extract $1,000 from each of those who would compete, and when a race of the sort on the public roads entails so many possibilities of grave legal complication and responsibility to all concerned with it, it is absolutely essential that the responsibility be fixed well in advance and be fixed clearly and on something tangible. "Robert Lee Morrell, Chairman," despite the fact that Mr. Morrell may be possessed of means, is suggestively indefinite. Of what is he chairman and why? Why his almost incomprehensible payment of a press agent's salary? Why the sudden snuffing of the "Metropolitan Automobile Association"? Why the equally sudden creation of the "Automobile Manufacturers Committee" and the substitution of taxpayers for sweet charity? Who comprise the "Automobile Manufacturers Committee" and who appointed them, and when, where, how and why? What is behind all the twistings and turnings and mysterious gumshoe operations?

If this proposed race for stock cars is not a plain game of graft, why is it not possible to play openly and above board? We do not say that it is a game of graft but if there is nothing in the allegement that the race is merely a play for fat pickings by a party of four or five men, to which as many newspaper workers will be party, why is it necessary to shuffle the cards under the table?

It does not seem possible that any man with a realizing sense of responsibility who desires an event in every way worthy of and industry and who also desires to avoid entangling complications is likely to pay $1,000 into a treasury that seems to have no bottom and which is obscured by so much fog. It is high time for a showdown.

About Converted Pleasure Cars.

As might have been expected sooner or later, free rein is being given to the suggestion that the interests of the commercial vehicle industry may be served to good advantage by converting second-hand pleasure cars into business vehicles by the adaption of a suitable body. Furthermore, the impression is conveyed that this may be done profitably by any one who is desirous of testing the economy of the motor vehicle for business purposes at considerably less expense than would be the case were the original investment to be made for machines constructed especially for the work. Nor does it appear at first sight that such a transformation would be in any way misleading to the investigator, or unprofitable from the ton-mile point of view.

Further reflection, however, develops the point that the car made to carry an eight hundred pound load of human freight at a forty-mile gait over the high road will not necessarily prove as satisfactory when called upon to carry a thousand pounds of merchandise at fifteen miles an hour over cobble stones. Even at its best, the pleasure car is given over about equally so far as its bulk is concerned, to machinery and passenger accomodation. Lengthening the wheel base and strengthening the frame may increase the floor space available for the load, but the sensitive, high speed engine of the touring car will demand extra cooling facilities as well as lower gearing when put to the sober task of commercial use. But here is a suggestion of changes other than the mere construction of a new body, while for absolutely satisfactory service the removal of the driver's position from that behind to one above the motor would be of advantage, in addition to which different tire and wheel sizes, stronger

Digitized by Google

springs, and new methods of attaching the body to the frame also would be required to gain the full value of the power available in the motor.

In the second-hand phase of the suggestion is seen perhaps a greater menace to the commercial vehicle than any which has yet been voiced. The questionable properties of the average used car as offered for sale at the average car broker's establishment are well known. Adding these to the uncertainties of the average carriage builder's treatment of the machine, and then putting the relic into the hands of an owner whose only desire is to test the motor vehicle as cheaply as possible—not to test it to best advantage—and the result is at once apparent. Save where the transformation is made at the hands of motor engineers and the trial service performed under really competent management, such an experiment must almost ininevitably result in dismal failure.

Nothing in this may be construed into a disparagement of the pleasure vehicle as a fit subject for conversion to any other use. Such a transformation is not only possible, but may be done profitably under proper circumstances. Just as it is possible to assemble a car successfully from components which may be bought in the open market, so it is possible to use the parts of any car in constructing another, or to alter any car to suit a different purpose from that for which it was originally intended. There can be no question that there would be a legitimate and useful field of endeavor in the conversion of machines in this way, were there sufficient demand to warrant it. But to throw open the door to unscrupulous and syster dealers to unload their battered, surplus touring stock as economical commercial experiments, just at a time when the commercial vehicle movement is beginning to show signs of healthy animation, is to throttle the market for new machines, and invite discouragement on the part of the user, rather than to stimulate both, as is the apparent intention.

Tire Chains and the Highways.

In connection with the recent strictures on the use of tire chains on the roadways of New York's park system there follows the suggestion that whatever progress is being made in methods of highway construction the ideal is still a long way off. Theoretically the road should be made to accommodate the vehicle—not the vehicle to accommodate the road. And whatever limitations are considered ought to be such as restrict the use of materials and methods which react away from the ideal road. Instead, roads which are capable of withstanding the heavy loads of commercial traffic are usually too rough for pleasure vehicles to traverse at even moderate rates of speed, as speed is rated at the present time, while the smooth and beautiful courses of boulevards and parks are wholly unsuited for the stress of laden vehicles.

Reduced to its lowest terms, the construction of the model highway comprehends but two elements, that is to say the construction of a foundation of sufficient strength to stand the wear and tear of maximum wheel pressure and abrasion, and a method of protecting that foundation with a covering which will be at once elastic and waterproof. Simple as these requirements are, however, they yet remain to be satisfactorily fulfilled. From the days of Roman road builders down to the present, while the ideal has been growing clearer and clearer as a vision, the reality has been approached with painful slowness. Even the best roads of the boasted system of Continental Europe require an amount of attention and upkeep which would spell their ruin were it not for the excellent systems in vogue and the cheapness of the labor available for working them. Furthermore, it will be a long time even yet before the manual of highway construction is completed, judging by present indications.

The Excitement of England.

It is unfortunate that in conveying an invitation to "follow our ideas," after having indulged in a "slashing preliminary article," the Messrs. Shippey, of London, should mark their communication to the Motor World "Private." Its publication would add to the interest of the exciting situation which they precipitated in England by privately offering for sale a few 1906 American cars of which they really were not possessed, which private offer was so publicly and indignantly scorned by that valorous protector of the British faith, Mr. Harvey Du Cros.

It may be that Messrs. Shippey are sincere in their belief that they are serving the interests of the American industry by picturing it as being on its "beam's ends" or tottering on the verge of bankruptcy or the brink of panic, but if so, their beliefs are sadly in need of renovation. We are sure, therefore, that they will pardon us for declining their invitation and refusing to follow their ideas. If they know anything at all about the American industry—and they should know something—they are well aware that if anything it is in better condition than the trade of either Great Britain or Continental Europe; it certainly is not in worse shape. It is very evident that in their haste to grasp "a pot of money" without risking a cent, they simply exaggerated wildly and slopped over so badly as to bring up "between the devil and deep blue sea." They were as unfortunate in their choice of men as in their choice of words and methods and have done no good for themselves or for any one else.

As for the shrewd, cold eyed Du Chos, who so courageously saved Great Britain from the "ruination" that might be caused by the "dumping" of 30 or 40 good, if bargain priced, American automobiles—well, there are those of us in America who remember Du Cros when he first began making his millions to which this country contributed at least a small pot. It is quite characteristic that he should wave away the American invasion with his left arm while opening the trap door for the Frenchman, the German and the Italian with his good right hand. That is one of the attributes of true generalship and financial genius.

If the British public has escaped paying 1906 prices for 1905 Continental-made cars or 1907 prices for the 1906 product, it may count itself more fortunate than the guileless Americans and it may therefore have real cause to thank Mr. Du Cros. We became rather used to that sort of "dumping" and at no time did we become half so excited as our British cousins. Perhaps it was because no Shippeys wrote letters to us, or because we had no Du Cros to spurn the cruel offers to "crab" or "control" a "pot of money," and to prove himself his own best press agent. Our British friends should calm themselves.

COMING EVENTS

January 14-18, Hartford, Conn.—Hartford Automobile Dealers' Association show in Foot Guard Armory Hall.

February 1-8, Providence, R. I.—Show in Providence State armory.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

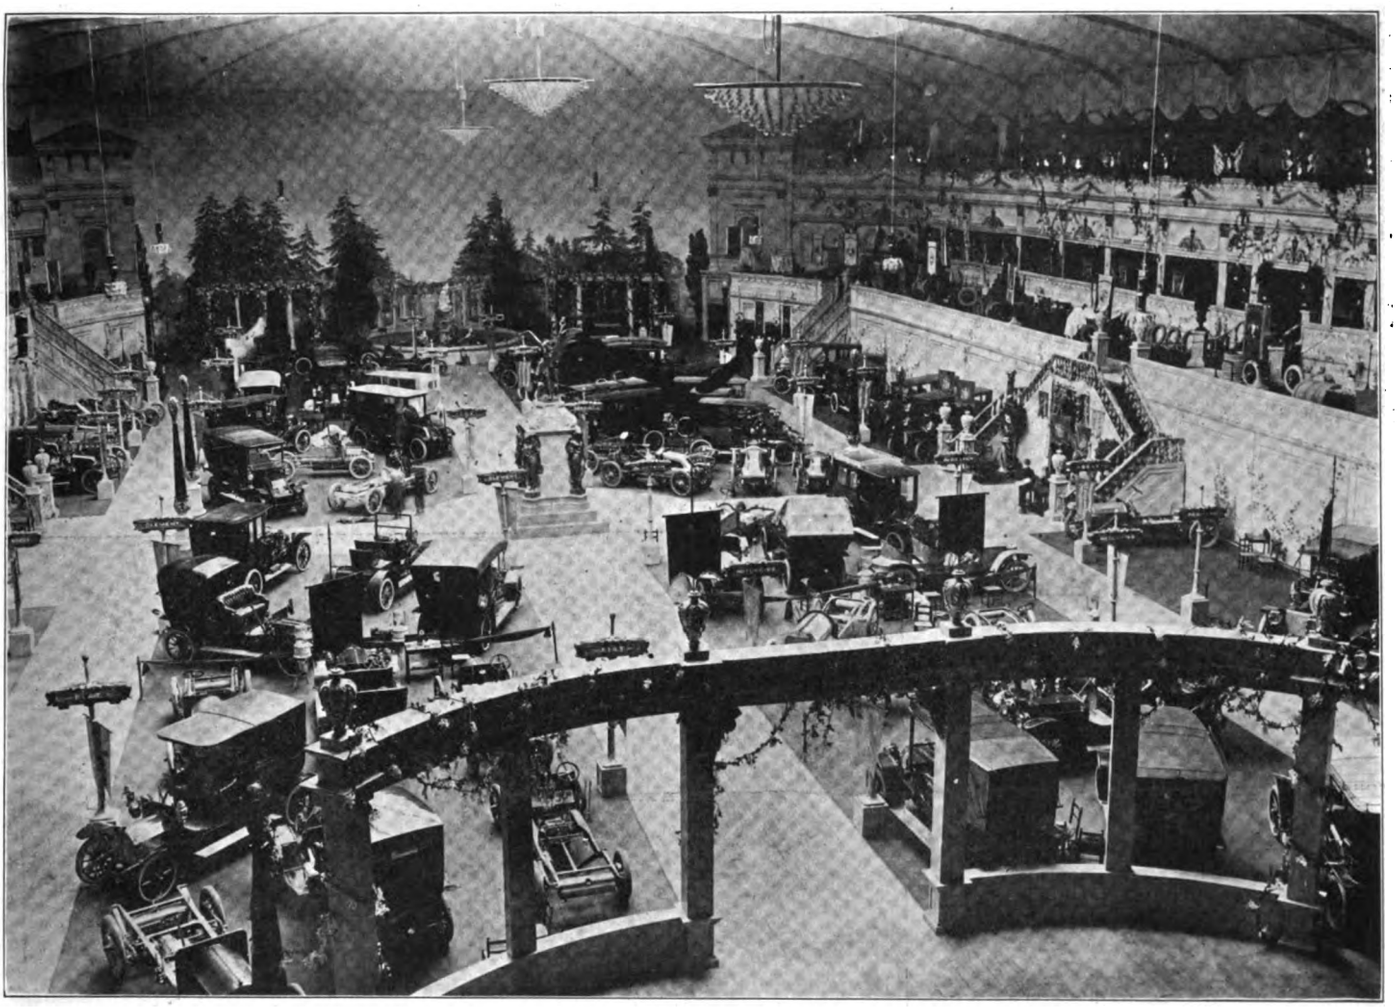
AMERICAN BODIES THE FEATURE

Importers' Salon the Most Beautiful Show Thus Far Held—Slim Attendance Despite Its Attractiveness.

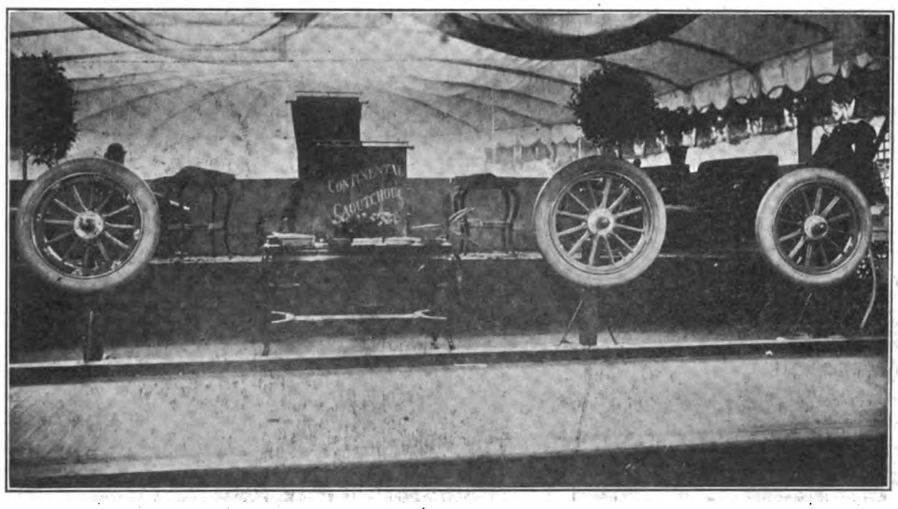


The Importers' Salon in Madison Square Garden, New York, opened on Saturday evening last, 28th ult.; it is still open. It is worth going to see, for it is, regardless of what it contains, the handsomest automobile show ever held in this country. The promoters heralded it as the "Paris Show transported to America," which, of course, it is not. It would not much more than fill a corner of the Paris building and lacks the magnificent signs and electrical displays and other glittering trappings. But the New York show required no such exaggeration, and it is an open question if it does not teach Paris itself a lesson. It presents a beautiful picture—harmonious, restful, pleasing. Purely as a spectacle it is well worth the price of admission.

It may be seen, too, without any of the elbowing or jostling which sightseers suffered at the American shows. For while attendance at the function now occupying the Garden has broken all previous Salon records, there never has been a day when the counting of the gate receipts has entailed overtime work or extra help. The previous record was established by the "Salon" held on the top floor of Macy's dry goods store, when as many as 50 persons were in attendance at one time. During the past several days, there have been several occasions when fully 500 people were present in the Garden. The average evening attendance probably has been between 300 and 400; during the forenoons, the place has resembled a deserted village. The New York public absolutely has refused to "warm up." Even on New Year's eve, when what one mean person described as a "midnight monkey parade" was held, and when the streets were literally packed with jubilating humanity, the attendance was slender. It was hoped that the parade would draw from the crowd, but it failed utterly to do so. Scarcely 300 people witnessed it. It was supposed to represent the "Evolution of Locomotion" and was led by a monkey or rather a man in monkey garb. The man's identity was not disclosed. The tail end of the parade was an Italian automobile, the agent of which, according to press agent report, paid $450 for the privilege.

The parade was largely a "frost" and if the attendance throughout the week also has been attenuated, it has in no way militated against the beauty of the show.

The decorative scheme comprehends the reduction of the huge Garden to a simple oval arena which, with the aid of the drop curtain at the eastern end is transformed into a graceful court of honor with intersecting central aisles, elevated platforms at either side and a peristyle directly in front of the drop partially surrounding a circular fountain of classical nude female design upon which colored lights are made to play from the balconies above. The presence of real evergreen trees about the fountain blending with the picture on the curtain gives an effect of distance which is at once harmonious and pleasing.



The ceiling and floor coverings are of soft light green tone, the aisle floorings being brown. The balcony fronts and walls are in imitation marble, ornamented here and there with gay bannerets and placques, and the lights are so disposed as to give an even illumination without glare. Each of the exhibits is signalized by a white post

GENERAL VIEW OF THE IMPORTERS' SALON IN MADISON SQUARE GARDEN

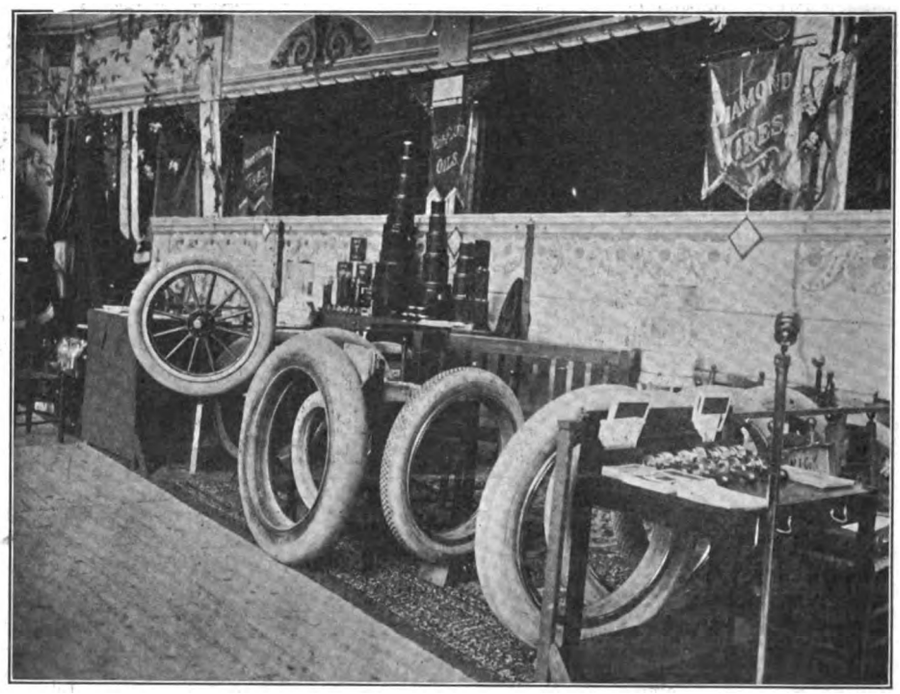
Digitized by Google

at either corner, bearing a blue transparency giving the name of the car exhibited in white letters, while below are hung banners giving the exhibitor's name in golden letters on a blue silk background. The bases of these posts are illuminated from the back, shedding a foot-light glow on the stands. The accessory exhibitors are all placed on the elevated platforms at the sides, the decorations being in keeping with those

CONTINENTAL TIRE EXHIBIT

on the floor, while over all, from the western end a framed painting of three undressed and winged ladies in some sort of ecstacy, peeps down over the huge blue flaming legend, "4th Importers'."

There is no crowding of cars or of visitors, no gaudy color effects, nothing to jar or disturb the sensibilities. From the little bowers back of the platforms on either side, where are easy chairs, and tables, to the concert hall, which is given over entirely to a grass plot with gravel walks running through it and a loan exhibition of pen and ink drawings, it gives ever more the effect of a show picture than of a real show.



There are 94 vehicles grouped about the stands on the main floor, of which 25 are shown in chassis only, the closed type of body being most conspicuous among the body shapes. Whatever the value of the show in other respects, the beauty and finish of the bodies is of unquestionable superiority and shown to better purpose than ever before on a similar occasion. In fact, if the show is possessed of any particular marked or significant feature it is the display of American bodies of foreign cars.

About half of the bodies on view are of domestic manufacture. That they compare favorably with the imported constructions merely supports the often repeated contention that the American carriage maker has no equal in any other country. As a matter of fact, of the whole number of 77 bodies shown mounted and dismounted, exactly 38 are home production.

Among the interesting features observable in the foreign built bodies, may be mentioned the disappearing seats seen in the Rothschild bodies which fold down forward and lie concealed back of the front seat when not in use, even their iron supports being hidden in grooves in the floor under the carpet. A hooded Victoria body with enormously high backed rear seat and flat canopy reaching from the top over the driver's seat to the wind shield, is shown to good advantage on an Isotta chassis. Another novelty is the five-seated touring body on the Maja car, which has an individual removable seat in the center of the tonneau instead of two, and divided rear seats of the bucket type.

As for the mechanical details which may be noted as of passing interest, there is the construction of the new shaft-driven Panhard, with its progressive type change gear in which the shortening of the case brought about by the use of two sliding gearsets has made possible the use of a master clutch enclosed in the same case with the gears, and also a novel system of brake equalization. The final driving system of the new F. I. A. T. made-for-America cars has a particularly substantial appearance owing to the use of the massive torque tube and its hinged mounting in the frame. The Hotchkiss gearset, in which the reverse idler is swung into mesh from above instead of below the lay shaft, offers a suggestive arrangement for investigation, as does the Renault method of operating the selective gearsets by means of a face cam. Perhaps the most unusual vehicle in many respects is the new light model C. G. V., which has the driver's seat on the left, with the brake and gear changing levers in the center of the foot board.

The cars exhibited are as follows: Bayard-Clement, Renz, Bianchi, C. G. V., Delahaye, Delaunay-Belleville, Dietrich, F. I. A. T., Hotchkiss, Isatto-Fraschini, Maja, Panhard-Lavasseur, Pilain, Renault, Rochet-Schneider, Rolls-Royce and Zust. In addition, Messrs. Brewster, Quinby and Rothschild also occupy spaces on the main floor.

DIAMOND TIRE EXHIBIT

The accessories division is represented by some thirty-six exhibitors, among the more prominent of which are the Diamond Rubber Co., Hartford Rubber Works Co., Continental Caoutchouc Co., Warner Instrument Co., Hartford Suspension Co., Dow Tire Co., Charles E. Miller, C. F. Splitdorf, Lavalette & Co., Michelin Tire Co., Robert Bosch, Inc., and Levi Rubay.

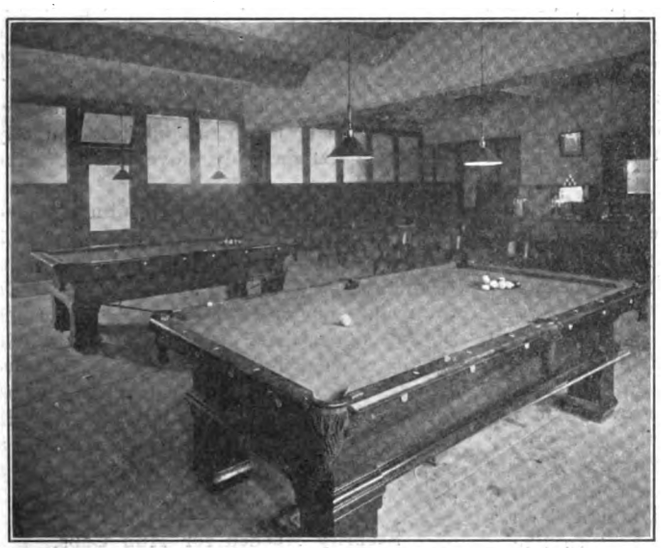
PHILADELPHIA'S MODEL GARAGE



Opened with a Society Function—Its Equipment Complete for Business, with Provision for Recreation.

Broad street, in Philadelphia, has acquired a garage de luxe which in its accomodations for the chauffeur and in its beauty of decoration and finish sets a highwater mark. The opening of the new building was made a "society event," at which time the evening clothes contingent were given an opportunity to inspect it. The garage is under the proud proprietorship of the Keystone Motor Car Co., the Quaker City agents for the Packard, and is located at 216-218-220 North Broad.

The building is of four stories and has high ceilings and broad expanses of window space to give plenty of light. The Broad street entrance to the show room is elaborate to a degree suggesting the entrosal of a fashionable hotel. The cement floor is strewn with rare Persian rugs and the desks of the salesmen and the other articles of furniture are in the subdued but rich Mission style. Show cases of supplies and accessories are also finished in the same style. Back of the show room is a garage room, separated by sliding doors, all cars entering from the street at the rear of the building.

A broad stairway rises to the mezzanine floor, which in front has a balcony overlooking the show room and in the back a similar balcony over the garage room. On this floor there is a ladies' reception and retiring room, and the private offices of the president and general manager and the general offices for the clerical force are also located here. The back part of the second story is given over to the chauffeurs, and as shown in the accompanying illustration, the provision for their comfort and entertainment has been very complete. In addition to steel lockers for about 100 men, there are several shower baths, and a smoking room with two billiard tables, chairs, and a lunch counter where light lunch and cigars may be obtained.

The third floor is a single room using the full width and length of the building, 53 by 200 feet. The room is without a pillar, and is used for the storage of cars. The top floor, in addition to a very completely equipped machine and repair shop, has a large stock room where everything is classified and stored in accordance with a catalogue. From the basement to the top floor runs an elevator big enough to take any car, and on the third and fourth floors are steel turntables adjacent to the elevator shaft, which is rather a new feature in garage construction. Altogether the building is in many respects a model combination of ornateness with practical and utilitarian virtues.

WHERE RECREATION IS ENJOYED

WHERE LABOR IS PERFORMED

PHILADELPHIA'S GARAGE DE LUXE

ABOUT ACETYLENE GAS CYLINDERS

Engineer Bowmanville Explains Some Causes of Explosion—Faulty Construction One of the Most Frequent.

"In the Motor World of December 25th, I came across the item headed "Prest-O-Lite again visited by fire." As I am the man who introduced that system in the United States, and who sold the patent to the Commercial Acetylene Co., 80 Broadway, New York City, of which company I was for four years the chief engineer, I cannot refrain from saying a word about the use of acetylene gas compressed in acetone and porous material, for the purpose of automobile lighting; writes Eugene Bowmanville, of Jersey City, N. J.

"If the gas cylinder, used on automobiles, was manufactured, by carefully following the patent and method of the Commercial Acetylene Co., explosion of gas tanks would be impossible. Personally, in several instances, for the purpose of demonstration, I have roasted fully charged cylinders of the Commercial Acetylene Co., leaving them in the fire until the fittings and safety device were partly melted, thus allowing the gas to escape, without producing any explosion; railroad cars, boats, etc., equipped with cylinder, properly made, have been destroyed by fire, but the cylinder was recovered intact, after the fire, except that the fitting and connection was partly melted but no explosion occurred. Accordingly, the cause of automobile cylinders exploding is from defective construction or other cause which may be one of the following:

"I notice that all makes of automobile gas tanks, with one exception, have brass and copper valves, and fittings. That the pressure gauge has its spring tube made of copper or brass, and the most strange and ridiculous of all is, that some gas tanks

Digitized by Google

have their safety device made of brass and copper, when it is well known that those two metals are a source of danger through the formation of acetilite of copper, when in contact with acetylene gas. At a pressure above 2 atmospheres, acetilite of copper may cause the cylinder to explode, when the temperature of the cylinder is above 90 degrees.

"Furthermore, the purpose of the porous material is to isolate the gas in the small cells so as to prevent the propagation of the explosive wave, through the whole cylinder, for that reason the size of the porous cell must not be larger than 1-60 of an inch, while most of the gas tanks on automobiles have been filled with loose asbestos fibre and introduced into the tank through spud opening without a binding material of any kind, to prevent the asbestos fibre from settling by the vibration of the car, which materially will leave an empty chamber in the cylinder, consequently rendering useless the balance of the porous material. With that state of affairs, explosion must happen for one reason or the other. Then, if a gas tank explodes amongst other defective ones, they will all go off, one after the other, from the effect of the concussion, while if gas tanks are properly made, explosion or fire will not affect them."

Test for Weak Valve Springs.

It sometimes happens that a motor which has lost its liveliness of action will be found on examination to be suffering from weak valve springs. Invariably this prevents proper closing and to some extent interferes with the timing of the motor. A good test for this complaint is to insert the end of a screwdriver blade between the convolutions of the spring and twist it slightly so as to increase the tension. If an improvement in the running is visible at once it may be taken for granted that the difficulty is resident in the valves and in the particular valve under examination. Similarly a test for too strong a spring is merely to press lightly toward its fixed seat with the screwdriver blade, paying careful attention to the effect on the action of the motor.

The apparent requirement of a stronger spring, however, should not invariably be taken as proof positive that one is required. In case the valve stem happens to be bent out of line, or is too tight a fit for its guide, the sluggish action which this develops may result in a loss of activity on the part of the motor which the increased strength of the spring will apparently cure. Hence when replacing or strengthening a spring which seems to be over weak for its work, care should be taken to see that the stem runs smoothly and straight in its guide.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

ELECTRICAL BRAKE FOR TESTING

Principle of a New Device for Measuring Horsepower—Its Practical Effect and Formula of Readings.

In the effort to devise more accurate and satisfactory methods of testing actual horsepower of automobile motors various ingenious systems have been evolved to supplant the ordinary brake test mechanism. Electrical systems came early in this development and there are at the present time a number of testing outfits in use in American automobile factories which depend upon electrical generation and absorption. In a few instances hydraulic testing devices have been devised, giving a high degree of accurate service, but that the field for ingenuity in this direction is still very wide and inviting is indicated by the new devices of this character that are from time to time brought out.

Of these one of the latest is the product of Messrs. Morris and Lister, electrical engineers in Coventry, and by reason of the fact that it differs materially from the systems so far shown, it is entitled to comment. While it is electrical in a sense, it differs from the usual electrical testers in that the motor under test is not called upon to generate current, but to overcome the magnetic resistance primarily set up by current from ordinary sources. A ring structure containing a number of electromagnets around its faces is mounted on a central shaft on which it may turn like a wheel on its axle, except that its rotation is limited to a small arc. Coupled directly to the crank shaft of the motor under test are two copper discs, which rotate on the same axis as the floating magnet frame just described and which have their faces close to the poles of the magnets. When electrical current is sent through the windings of the electro-magnets, what are known as "Foucault currents" or "eddy currents" are generated, creating a resistance to the turning of the discs when the magnetic floating portion cannot revolve also. A weight beam extends at one side of the floating portion to prevent its rotating with the discs because of their electrical or magnetic unity and the degree of pull which the discs exercise on the floating portion is measurable by means of the weights hung on the beam and their distance from the fulcrim.

By regulating the amount of current in the magnets and putting the weights at the points where they balance the drag of the discs the reading at any motor speed may be taken. Increasing the current to the magnets and putting extremely heavy weights on the beam can be done to a point where the motor under test will be stalled because of the resistance to the rotation of the discs.

In practical effect it is like a prony brake, except that it quite does away with the troubles incident to disposing of the heat of friction and to the inaccuracies resulting from constantly varying frictional resistance. The work performed is ultimately dissipated as radient heat from the discs, the eddy currents set up in them resulting in their increase in temperature. The discs are fitted with fan blades which help dispose of the heat as they revolve. It is a simple substitution of magnetic drag for friction and the switchboard permits of a very fine degree of regulation of the pull. The power is weighed just as it is in with the prony brake, and while electricity is employed, there is no complication of expensive generating mechinery and resistance sets. The particular advantage of the system lies in the possibility of applying the load to the motor under test evenly and without shock, as well as that once the current has been adjusted the load is unvarying and may be maintained indefinitely without danger of overheating the brake.

The formula used for the readings is one in which the brake horsepower equals 2 times 3.1416 times the distance of the weight from the center of the shaft in feet, times the weight in pounds, times the revolutions of the copper discs per minute, the whole product divided by the constant 33,000, giving the direct figure. The machines as at present made are suitable for from 3 to 35 horsepower, and will take 1,500 r.p.m. on a small engine down to 750 r.p.m. for a larger size.

Security Needed for Hub Caps.

With the ordinary double chain drive, or with the old-fashioned type of live axle, no particular difficulty was attached to the loss of one of the rear hub caps, other than that opportunity was afforded for dust and dirt to work their way into the bearings. With the modern system of clutch driven rear wheels, however, the loss of the cap frequently involves the possibility of working out the driving shaft thus freeing the wheel of its drive and turning adrift one side of the differential. On this account it is somewhat to be wondered at that makers do not take more pains to secure the hub caps in place by some locking device, especially as far as the rear wheels are concerned, thus safeguarding a transmission system which otherwise has few faults.

Care in Removing the Magneto.

Magneto mountings frequently are so arranged that the entire device may be removed from the car by simply loosening one or two screws. The operator should invariably take pains to see that the driving gear is plainly marked to indicate the proper method of reassembling, however, before taking out the magneto, as otherwise it may be practically impossible to get it back without going over the timing in exact detail.

BROKERAGE IN SECOND-HAND CARS

Methods of Operation That May Eliminate the Second Hand Dealer—Bringing Principals Together.

When a prospective purchaser of a motor car starts in to price new machines and finds that the cost of well-recommended makes is high, and then notices newspaper advertisements, offering "slightly used" second-hand cars for sale at remarkably reduced prices, he is set thinking. The expectant owner may not be in a position to afford the price of a new car of a certain make that he would like, and at the same time, may hear of a second-hand machine of the same model, which has been in commission for a few months and can be had at a cost that would come within his reach.

The question that confronts him is: will it be worth while to buy this used car? Would it not be better to pay the same amount for a new machine, listing at a lower figure? Will this car that has been in commission for a period of some months last as long as a new car of cheaper design, to be had for the same price as is wanted for the used model?

This is what a person has to consider carefully before he signs the check and as a motorist friend remarked to me recently, the choice of a car is like the choice of a wife. You never can tell. Of course, the wiseacre who thinks he knows it all, but in reality has had no experience with cars, will tell you that a man is a fool to buy a second-hand automobile and that he will regret it sooner or later. However, having been associated with many people connected with the motor car industry, as well as members of automobile clubs and numerous motorists generally and having been a motorist myself, I have learned from good sources that there is another side of the question. I have learned that in many cases a man will strike a profitable bargain in a second-hand machine. The essential thing for a prospective purchaser to know, is when to buy and when not to buy a car that has been used.

Ignoring for the present, the case of intimate friends selling a car to one another, when the deal is more or less personal, I will venture a few remarks on what my experience among persons who have had transactions with concerns dealing exclusively in used automobiles, has been. Personally, I have nothing against those engaged in the second-hand car business, but I have learned from numerous customers of these, that in many cases, in fact in the majority, dissatisfaction has resulted on the part of the purchaser. The reason for this is simple. A man has a 1906 car that cost originally $3,000 or $4,000, and has stood some rough useage and has been driven may be 10,000 miles. It may have no real mechanical defects, but at the same time needs priming up, new tires, batteries and other parts, and sooner than go to this expense, the owner prefers to sell it and buy a new machine. He may wish to make a European tour and purchase a foreign car while abroad. So he offers his car for sale to a dealer in "hand-me-downs" and the latter tells the owner that he is willing to give four or five hundred dollars cash for the car, as it stands. The car probably has this much worth of accessories and improvements on it and naturally, if the owner thinks his toy is worth anything at all, he will refuse to sell it at such a low figure. On the other hand, he may consider that the machine has seen its best days and is about to fall apart and so he takes the $500 cash, which just about pays his wife's millinery bill and buys him a pack of cigarettes.

The second-hand dealer then puts a man at work on the car to "touch it up" and put some varnish on it and squirt some oil in the engine base to try to ease up some of the "knock" in the cylinders, and he may have the poor little worn out valves reground, so that there may be a little compression in the lungs. Then a buyer is influenced to take it home to his wife for only $2,000. This is the buyer who gets "stuck." It happens almost daily.

Purchasing under the above conditions (which may not be known to the buyer who has been deceived and lied to), is a very poor proposition. Now here is another method, which I have known to give satisfaction to the buyer in many cases. My opinion is entirely unbiased, as I am in no way connected with any retailing concern.

There is, in a building on Thirty-fourth street, New York City, a man well known in automobile clubs and among motorists and the trade generally, who is noted for an amusing little joke he plays on people. One morning some months ago, he advertised a second-hand car for sale, in a daily paper. About 10 a. m. a man called at his place of business in response to the ad. The caller was somewhat surprised at finding the gentleman in a small office on the ninth floor, and asked:

"Where is that car you have for sale?"

"Here it is," replied the advertiser blandly, "right here."

With that, he removed a toy automobile from a desk drawer, wound it up and rolled it across the floor.

"Don't you think she runs smoothly?" he inquired.

The man with the small car was not a lunatic, as his caller may have imagined at first. He is repeating the same trick nearly every day for other callers, for this person is an automobile broker, doing a legitimate brokerage business in second-hand cars, for clients who wish to buy or sell the same. Here is where his business differs from the ordinary second-hand dealers. He acts much the same as a real estate or insurance broker, merely putting the buyer in touch with the seller, the broker not attempting to handle the car for sale or have it on his hands at any time during the transaction.

For instance, Mr. Jones desires to pay a fair price for a fifty horsepower 1906 high grade car, that has been carefully used, one that is in perfect order and not requiring any repairs. He cannot find what he wants off-hand and has not the time to spend in searching for a car that will suit him. He goes to an automobile broker and states his wish, paying no fee whatever and it is understood that he will not pay the broker a fee at any time in the future either, (for a broker making any charge to a buyer-client, is not legitimate). Now the broker knows of a Mr. Smith on his list, who has just such a car as Mr. Jones wishes to buy. The amount that Mr. Smith wants, is about what Mr. Jones is willing to pay. Satisfying himself that his clients are both responsible parties, the broker arranges an appointment so that Mr. Smith may give the prospective customer a demonstration. The dicker for the sale of the car is made between Messrs. Smith and Jones, the broker not entering into the case at all. The whole business is done openly. When the transaction takes place, the broker receives a commission of from 5 to 10 per cent. from the person selling the car.

To my mind, this is a fair, legitimate commission for his services, in bringing the two parties together, it being remembered that the broker advertises the car for sale in daily papers, until the right purchaser is found, assuming all the expense and risk in such cases. Thus by going to a broker, a purchaser of a second-hand car, is put in touch with the right person, free of all costs, and he is reasonably sure of getting a car that has merely been in private use and not an old broken down "tub" that has been banged around by garage employes and used for business more or less, and then rebuilt several times and painted. The transaction becomes about equivalent to the case of a man selling his car to a personal friend, although often more satisfactory than a "friendly deal." If the broker consulted is what he should be, he will only do business with responsible private persons and not with dealers in second-hand cars. If a broker tries to send you to a dealer, don't listen to him. A good broker will not attempt to sell a car for a client, which he knows to be defective in any way.

There is absolutely no good reason why a man should not purchase certain machines that have been in use for a short time, when the price asked is reasonable. A car that has been used for a few days by an owner, becomes a "second-hand" affair and depreciates at least 20 per cent. in value, although it may be in perfect condition. Indeed, it is a well known fact that a car often runs better after having been run six or eight hundred miles, than it ran the day it left the factory. Any one of a num-

Digitized by Google

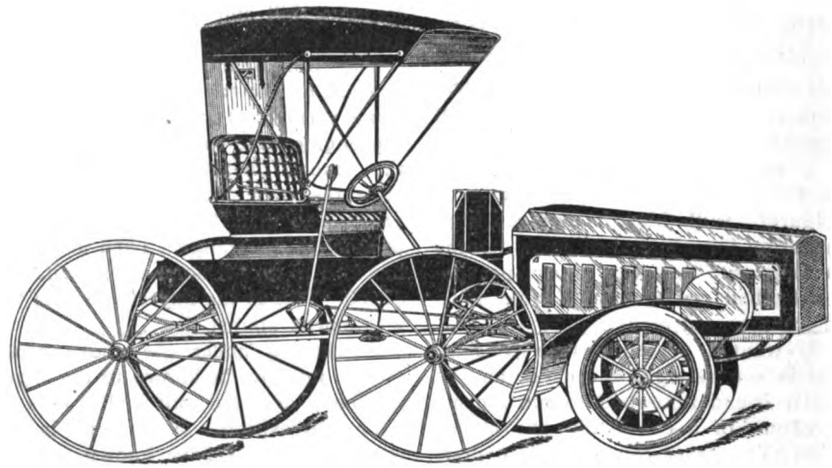
ber of reasons may be the cause of a man desiring to sell a car when it is in perfect condition. One very common reason, is that an owner wants a higher-powered machine that will make 60 miles an hour. Severe illness, necessitating confinement indoors is another. A cause that is not unusual, is that owing to the tight money market, a man is forced to give up his little luxuries, for as a well known dealer once remarked, three-quarters of the motorist body are persons who cannot afford automobiles. A desire to tour abroad is another excuse for an owner wishing to dispose of an American car, while a death in the family sometimes warrants a person giving up the automobile, either for financial or other personal reasons. The mere fact that a man has a car for sale, does not say that the machine is unworthy. By dealing direct with the persons selling a car, with the aid of a broker, it is not difficult to determine the actual reasons that warrant the car being sold.

At present, there is a demand for used 1906 and 1907 models in good condition. A 1908 American-made car can be sold for about 50 or 60 per cent. of its list price. Second-hand 1907 cars are worth slightly more. From 5 to 10 per cent. commission is the proper fee for a broker selling a car under conditions described. Whether or not the second-hand automobile is a bargain, depends entirely upon the car, its personal history and the price.

M. W. C.

Worcester Show is Abandoned.

Worcester, Mass., will not have an automobile show this winter. This was definitely determined Friday last when it was found that the Worcester armory, where last year's exhibition took place, could not be obtained this season. There is no other place in the city available, the auditorium in the armory being the largest in the city. About a week ago the State took over the armory from the City of Worcester and now the local authorities have nothing to say whatever about its future conduct. The State authorities last week refused to permit the armory to be used for an automobile show in spite of all the influence members of the Worcester Automobile Club could bring to bear in the matter. They found the authorities more unbending than those of some other States.



Incorporated to Hold Newark Show.

The joint committee composed of members of the New Jersey Automobile and Motor Club and the New Jersey State Automobile Dealers' Association, under whose auspices the first annual automobile show will be held in Newark, N. J., has decided to form a corporation to carry on the exhibit. It will be known as the New Jersey Exhibition Company. The show will take place from February 21 to 29 inclusive, in the auditorium at Electric Park, a resort in the Vailsburg section.

HERE'S THE "IRON HORSE" AT LAST

It is "Caldwell's Cylinderless, Boltless, Noiseless, Cussedless Gasolene Engine" —Works Running or Standing.

In common with the search for the fountain of youth, and the endeavor to "harness" perpetual motion, the quest for the mechanical horse has been going on for many, many years; in the motor car, the mind of many a restless inventor has found peace and longing satisfaction. But it is not to be questioned that the motor car is not a substitute for the horse in the strictest sense of the word, since it cannot be applied at the will of its owner to the hundred an one uses which have endeared the patient equine to his ancestors for centuries back, nor can it be used in connection with the "rolling stock" already an outstanding investment with the horse owner. To some it might even appear that the so-called motor buggy is the nearest possible approach to the ideal in this respect. Not so with the persistent Iowa inventor of the "six-wheel runabout" here depicted. His genius has carried him a step beyond the achievements of all others and enabled him to produce the veritable "iron horse" of fiction and fancy.

THE "IRON HORSE" HITCHED TO A BUGGY

Although possessed of a motor, perhaps as an attribute to the mechanical arts rather than as a necessity of locomotion, this metal beast according to its inventor's claims has "no cylinder, no bolts, no nuts to work loose, no gaskets to blow out, no packing of any kind." Instead, the "cylinderless, boltless, noiseless, cussedless," gasolene engine, whence springs the locomobility of this locomotor attachment is comprised of a moving "piston" which is hollow and slides back and forth upon a stationary "head," thereby providing means to effect a series of operations identical in principle and effect with that of the ordinary four-cycle method of gasolene operation.

Two-thirds of the six-wheel runabout is buggy. The useful reminder is attached to it by what in farm parlance would be known as the "shaves" and through them, transmits its tractive effort to the vehicle proper. As will be evident at once, the cylinderless portion of the outfit is attachable to any sort of carriage or wagon, and furthermore, by suitable adaptation, may be used as a stationary power producer for such useful and domestic operations as sawing wood, grinding coffee, spices and cattle fodder, breaking out stump land, or planting grain. The mechanism also may be attached to a sleigh or bob sled for use during snowy weather.

As for the mechanical portion itself, the motor is rated at 10 horsepower, showing its absolute capability of replacing one or two horses; the plant is firmly mounted on the truck, which, in turn, runs on 1⅝-inch artillery wheels, 30 inches in diameter, shod with 1⅝-inch solid tires and running on roller bearings on a 1⅝-inch axle. A year's guarantee goes with the mechanism, which is moreover, a better inducement than the average horse trader is able to offer in the same line.

Certainly the device is peculiar looking to the normal eye. But then, as the inventor says: "Odd things are generally the best." Further, it is evident that a great deal of energy must have been spent in producing it. Of this the inventor further remarks in his catalogue:

"Many of the best skilled machinists and gasolene engine experts have worked on this invention for the last three years,, and no one but the inventor can appreciate the patience and persistent efforts necessary to overcome the obstacles ever presenting themselves in working out the intricate mechanism of a useful and valuable invention, and their reward is the protection of the government in their rights under the patent until they are reimbursed for the money and the tedious, thoughtful hours that have been spent on it."

A company to manufacture the thing is in existence in Waterloo, Iowa.

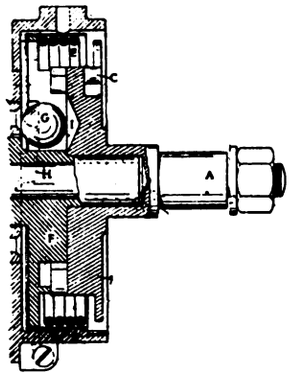
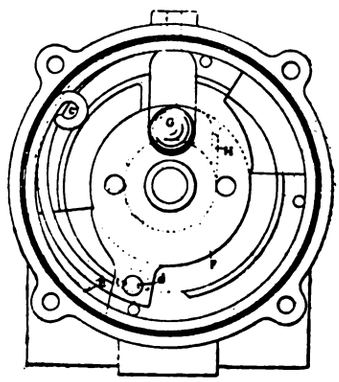
MAGNETO SPARK AT FIRST SWING



Obtained by a Device for Automatically "Snapping" Over the Armature—Details of Construction.

One of the most frequently stated objections to the magneto is the difficulty of "swinging" a large motor with sufficient rapidity to obtain a positive spark for the first ignition. To overcome this difficulty, as well as the possibility of stopping the motor for the same reason when throttled way down or when suddenly overloaded, several methods of producing a sudden throw of the armature past the point of maximum current generation have been devised. One of the most recent of these, which is particularly suggestive because it provides a means for automatically "snapping" over the armature whenever it is run slowly, regardless of whether the motor is being cranked or is running under its own impulses, is that employed in the Unterberg-Helme high-tension magneto, a German production shown for the first time at the Paris Salon.

In this arrangement, the armature instead of being driven through a positive connection has a spring driving gear, the spring being sufficiently strong to keep the armature in absolute synchronism with the driving gear under ordinary circumstances. When its speed is dropped below a certain predetermined amount, however, a peculiar form of automatic latch comes into action as a result of the reduced centrifugal force, and serves to retard the motion of the armature for a portion of its revolution, releasing it at the instant of timer contact and thus permitting the spring to drive it ahead of the timing gear for an instant and at a sufficient rate to guarantee the generation of a proper spark. The manner in which this is accomplished is shown by means of the accompanying illustrations.



As is apparent, the driving shaft, A, carries a disc, B, to which one end of the helical spring, E, is attached by means of the stud, C, fixed upon its inner face. The other end of the spring is attached to the armature shaft by means of the stud, d, affixed in the face of a plate of peculiar shape which is keyed to the shaft. Upon the side opposite the stud, d, is a projection carrying the radial slot shown in the illustration, which is of such size as to permit the ball, G, to travel freely in it under the action of centrifugal force.

When the ball is at the outer end of its slot, the armature is permitted to turn freely as driven through the spring. When it is at the inner end of its travel, however, any rotation of the shaft, causes the ball to strike a projection H, on the end of the stationary armature casing, thus temporarily locking the armature from further rotation, and permitting the continued movement of the driving member, B, to wind up the spring. At a certain point, I, in the disc, B, however, is a slight depression into which the ball is forced when the disc has made nearly one complete turn. The effect of this is to permit the ball to jump over the projection, H, thus allowing the spring to force the armature ahead at high speed until the ball again brings up

against its stop, when the process is once more repeated.

In this way at low engine speeds the armature motion is intermittant, and invariably at high speed, while so soon as the motor speed becomes sufficiently great to drive the ball to the outer end of its radial slot, the motion becomes continuous and regular. The magneto to which this arrangement is attached is of the true high tension type, having both primary and secondary windings on the armature and hence requiring no external transformer coil. An unusual feature of its construction, however, is the placing of the condenser, which is mounted in the stationary casing of the timer box, whereby it is relieved of some of the vibrations usually sustained in the armature, and is thereby rendered more durable.

Keep Motors Warm in Winter.

"Keep your motors warm," is the advice of H. E. Coffin, vice-president of the E. R. Thomas Detroit Co. "In the winter weather when the car is run at speed, the cooling properties of the radiator are much greater than in warm weather. A motor will start easier and run better if a sheet of cardboard or other light material covers part of the radiator."

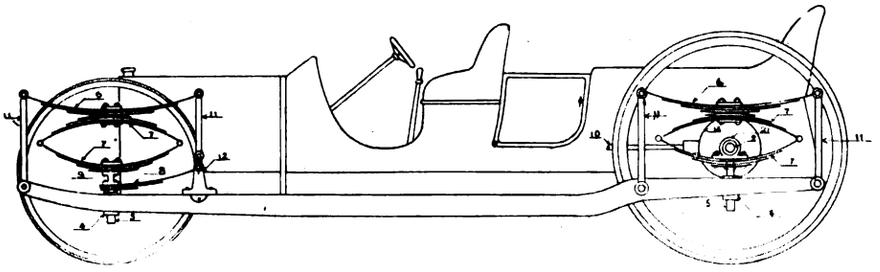
READINESS IN MAKING REPAIRS

Parisian Mechanics in Unique Competition to Demonstrate Ability—Judgment as Well as Skill Tested.

A unique form of breakdown competition took place at a motor cab garage in Paris recently in which a number of drivers were called upon to rectify some artificial disorder of the machines under test within a stated length of time and under observation by the judges. Each of the cars, all of which were identical in construction, was placed in a curtained enclosure and only the competitor who was to work on it was admitted to the enclosure with the judges. The difficulties which had to be set right were in no case of a serious nature, being only such as the average driver might be called upon to repair on the road at any time. Thirty-two mechanics entered the lists, and after the preliminary trials in setting right certain engine difficulties, the successful competitors were permitted to compete in a tire replacing time trial.

In one instance a short circuit was created in the magneto by introducing a little piece of lead foil in an inconspicuous place. This was discovered by Paul Miltgen in 1 minute 28 seconds. Only five out of ten competitors succeed in locating the trouble inside of the allotted 25 minutes, and only two of these excepting Miltgen, came inside of 4 minutes. The second difficulty proved to be a partial stoppage of the induction pipe, but only one competitor was able to discover it, and it took him 11 minutes to do so. Another driver, Bonnet, by name, took just 4 minutes 45 seconds to hunt out a choked carburetter jet and get his engine running, while the sticking float valve was adjusted correctly by Lallement in 1 minute 23 seconds.

Bonnet, second in the general classification, won first place in the tire replacement trials, removing, repairing and replacing one of his tires in 9 minutes and 46 seconds. Miltgen, who won first place in the adjustment trials, lost the tire competition owing to a lame arm. The idea is held to be particularly successful in a general way because it furnishes useful training for the men, sets them thinking and discussing the problems involved, and besides furnishing considerable interest as a contest, is simple and inexpensive to conduct.



It is extremely difficut to impress upon the average driver the importance of frequent regulation of the spark time. Running conditions vary so constantly when the machine is on the road, that it seldom happens a single setting of the spark will serve to best advantage for any length of time. Therefore the operator's finger should never stray far from the controlling lever.

PROBLEM OF THE HIGH WHEEL

Solution Offered in the Form of a New Spring Device—Details of a System of Low Suspension.

According to the ideas of many engineers, the only conceivable way of reducing the mounting and suspension of the motor vehicle to a point where it will be practicable to eliminate the pneumatic tire and replace it with solid rubber is to adopt the high wheel. With the high-wheeled buggy type of vehicle this is possible without effecting any material alterations in the structure. It is evident, however, that for

the larger and heavier vehicle, where it is necessary to lower the center of gravity materially, an entirely new system of springing must be devised in order to render possible the use of large wheels. A novel suggestion in this line is found in the system recently designed by Henry Pokorny, Indianapolis, Ind., in which a special type of "three-half" elliptical spring, as it may be termed, is made use of, together with an under-slung frame with low center of gravity and general structural features otherwise similar to those in common use with standard touring cars.

The design in question, which is here illustrated, comprehends the use of wheels of 40 and 50 inches diameter, front and rear, shod with solid tires and mounted on axles of the usual I-beam and tubular type respectively. The lower sides of the main, or elliptical portions of the springs are slung beneath the axles in special perches while the shackle bars are made of sufficient length to lower the frame to the desired clearance above the ground notwithstanding the great height of the spring set. In addition to this, the oscillations of the frame are confined to the vertical sense at both ends by means of guide bars riding in blocks on the frame, but attached to the axles by means of couplings to which they are affixed through ball and socket connections.

Turning to the application of the system to the near axle, it will be clearly apparent that the main spring, 7, is clipped to the secondary semi-elliptical member, 8, and rides in the perch loosely mounted over the axle tube, 2. The frame is supported by the shackle bars, 11, the part indicated by the numeral 3, being dropped even lower than the rear end, thus lowering the center of the frame sufficiently to permit the adoption of the side entrance type of body. The driving shaft, 10, and differential housing, 14, are outlined in their natural positions, showing their extreme height in the body, relatively speaking.

In the case of the front axle the disposition is practically the same as in the rear except that to the other springs is added a guide spring, 8, which is of quarter elliptical shape and extends from the shackle bracket, 12, on the upper side of the frame, to the lower side of the axle, 9, thus serving to restrain its motion at the same time tending to interfere with any possible excessive rebound which might occur. The rear and front shackles of the front spring are of different lengths in this instance, owing to the introduction of the guide spring and the bracket upon which it is supported.

While there are many arguments in favor of the use of the high wheel, hinging chiefly about the matter of gentle and resilient suspension, it is equally apparent that numerous difficulties stand in the way of its adaptation to present types of vehicle. So numerous and conflicting are these difficulties, in fact, as to prove well-nigh discouraging to the designer who attempts to solve the problem at first hand. So that though its use may come about in the course of time, it is to be expected that it will be brought about by gradual degrees rather than at a single stroke of the designer's pencil. Incidentally, the working out of the questions which are involved in the way of under suspending the frame, and reducing the spring mounting to its lowest terms must be of great benefit in the commercial vehicle field where the low loading platform is a desideratum not yet fully appreciated.

Inspect the Mechanical Lubricator.

In the case of a mechanical lubricator which is driven by means of a chain or belt, it should be borne in mind that the mere fact that the driving gear is in motion does not signify that the mechanism within the tank is working properly, nor that the oil is being fed at the proper rate. Sometimes the little set screw holding the driving pulley or sprocket to its shaft backs out sufficiently to permit that member to turn idly upon it. When the slippage is sufficient to permit the pumps to remain at rest, the cessation of the feeds will be observable through the sight feed glasses. When it is only sufficient to decrease the rate of feed without stopping it altogether, however, there is danger of trouble in the bearings. To guard against this difficulty which, though rare, nearly always is at the seat of a very troublesome difficulty, it is well to inspect the driving gear of the lubricator from time to time.

Car for the Traveling Photographer.

Like the war automobile and the house car or motor salon of the supra touring order, various elaborate applications of the motor vehicle to the uses of mankind are from time to time appearing. Quite the latest of these is the photographer's car, which is the invention of a Frankfort-on-Main genius. On a motor chassis of special construction is mounted a roomy closed body containing a dark room fully equipped, together with storage space for a large amount of paraphernalia. Apart from the value of such an arrangement to the traveling portrait artist, it would seem that the war correspondent and news photographer well might utilize the idea to profitable advantage.

Keeping Things on the Move.

"See that window across the street," said the manager of the New York branch of a well known automobile concern, pointing to a rival establishment on the opposite side of Broadway. "For almost three months that identical car has been in that window in exactly the same position, without a change of any kind. Nobody expects to see anything new in there any more. I don't mind telling you that if I cannot get a new model to put in our window every week I nevertheless change about with the cars I have, altering the position in the window each time so that there is an appearance of 'something doing.'"

Many Automobiles Escape Taxation.

With 3,000 automobiles owned and operated in Colorado, and valued at between $3,500,000 and $4,000,000, but 936 have been reported for assessment, with a valuation for assessment purposes of $404,405. The State auditor considers this quite remarkable, in view of the fact that there are more than 2,000 cars in Denver alone. Outside of Denver the number of automobiles owned is estimated to be about 1,500.

Labor of Developing a Color.

Few persons fully realize the vast amount of work required to give a body its completed dress. To obtain the new Pope-Toledo blue finish, for instance, it is stated that no less than 32 painting operations are required. Likewise the time required to season the pigments properly is a factor seldom taken into account, though it totals up very rapidly.

HEARING ON TIRE CHAIN ORDINANCE

Motorists Present Their Protest to New York City Park Board—Discussion of Legal Points Barred.

Because of apparent lack of organization and slimness of attendance the hearing before the New York City park board on Thursday last, 26th ult., arranged by Charles Thaddeus Terry, counsel for the National Association of Automobile Manufacturers, in behalf of motorists generally, to protest against the recent ordinance passed by the bark board, prohibiting the use of tire chains on any of the roadways under the jurisdiction of the board, left no great impression upon the servants of the city. Aside from being assured that the ordinance would be only enforced on gravel and macadam paved thoroughfares the protestants against the ordinance did not make any great apparent headway. The hearing was held in the Arsenal in Central Park before President Henry Smith, Joseph I. Berry and Michael J. Kennedy of the park board.

Melvin Bender of the New York State Automobile Association was the first speaker. He described the various kinds of non-skid devices as used on automobile wheels and told of their several actions on the surfaces of roads. He brought out the point that while steel studded tires had a tendency to damage a road, tire chains left only their imprint in a road surface, like a matrix in a soft surface. He also touched on the legal aspect of the ordinance, asserting that the park board did not have legal authority to pass and enforce such an ordinance. President Smith replied by stating that before the ordinance had been drawn up, the city's corporation counsel had been consulted, and that the board had been assured by him that they had full power to pass and enforce the ordinance. Mr. Smith also put a damper on some of the other prospective speakers by saying that the legality of the ordinance would not be considered, as that phase of the question must be discussed with the corporation counsel of the City of New York.

That tire chains are the result of ten years of experimental work with various non-skid devices, and are the best for such purpose, was advanced by Hiram Percy Maxim, of the tire committee of the Association of Licensed Automobile Manufacturers. Although he is a lawyer, Charles Thaddeus Terry, did not consider the legality of the ordinance, due probably to President Smith's earlier admonition that an argument on that score would not be listened to. Mr. Terry therefore said that as automobiles are constantly multiplying in number, that roads must be adapted to their use, and that if greasy roads were dangerous, they should not be made more so by an action of the park board in enforcing an ordinance that prohibits making them as safe as possible by stopping the imperative use of non-skid devices of some sort.

The general tenor of W. W. Niles's remarks was much the same as the preceding speaker, and A. R. Shattuck, former president of the Automobile Club of America, suggested that the park board prohibit the use of tire chains only in dry weather, but allow them to be used in rainy or snowy weather.

Russell A. Field, secretary of the Long Island Automobile Club, said that the members of the Brooklyn organization were of the opinion that the ordinance had been passed under a misapprehension as to the real effects of the various kinds of non-skid devices, and that if the members of the park board could find time to make some personal experiments, the edict against tire chains would be removed, he thought. The hearing was adjourned after Messrs. Bender and Terry submitted briefs.

The hearing was arranged after a protest from metropolitan automobilists generally following the enforcement of the ordinance prohibiting tire chains on any of the roadways under the jurisdiction of the park board. The precise text of the ordinance follows:

"No automobile or horseless or other vehicle wearing chains over the tires of their wheels shall enter the public parks or the traffic roads under the jurisdiction of the Board of Parks without permission of the commissioners having jurisdiction. This rule and regulation shall take effect December 16, 1907."

It is a question whether the park board had a right to pass the ordinance in opposition to the provisions of the State law regulating the use of motor vehicles, which was passed in 1904. Local ordinances are prohibited as set forth in Section 4, subdivision 3, which reads:

"Subject to the provisions of this act local authorities shall have no authority to pass, enforce or maintain any ordinance, rule or regulation requiring any owner or operator of a motor vehicle any license or permit to use the public highways or excluding or prohibiting any motor vehicle whose owner has complied with section 2 of this act from the free use of such highways except such driveway, speedway or road as has been or may be expressly set apart by law for the exclusive use of horses and light carriages."

But the right of the park board to pass the ordinance is a question that will have to be argued or fought out in the courts. The point at moment is that apparently nothing was gained at the hearing last Thursday as the park board refused to listen to anything that would tend to suggest that it acted outside its rights in passing the ordinance.

"NATIONAL" AND "INTERNATIONAL"

Official Definition of the Terms as Applied to Racing—How the Promoter Can Secure a Sanction.

"A national race is a race where the entrants are respectively named by and represent any two or more of the automobile clubs affiliated with the American Automobile Association."

Therefore should Willie Jones of the Hohokus (N. J.) Automobile Club, and Tommy Brown of the Automobile Club of Bingville (N. Y.) wish to conduct what would be known and recognized as a "national race," under the American Automobile Association's definition, all they will have to do is to select a name for it, secure a sanction upon recommendation of their clubs, providing those clubs are affiliated with the governing body. Of course, it is not quite as bad as that, but according to the resolution as adopted at the meeting of the executive committee of the racing board of the American Automobile Association, in New York City, Saturday last, 28th inst., any one can promote a "national race" if the entrants are nominated by two or more clubs, no matter how obscure they may be, conditional only on the fact that they are affiliated with the American Automobile Association. On the face of it the resolution, while probably designed to correct an evil, smacks of the ridiculous.

The other resolution passed at the same time was a definition of an "international race." It says that "an international race is a race where the entrants are respectively named by and represent any two or more of the recognized national affiliated automobile clubs of the world."

The meeting, which was presided over by Frank G. Webb, in the absence of Chairman Jefferson De Mont Thompson, who took a day off to get married, did not transact any other business except the granting of several sanctions, among them one to "Robert Lee Morrell, chairman, First road race for Briarcliffe trophy, Westchester county, New York, on April 24th, 1908."

This is popularly supposed to be the stock car race "for sweet charity'$ sake" which originally was undertaken by Mr. Thomas Francis Moore's "exclusive" but suspiciously subdued Metropolitan Automobile Association, and more recently by somebody's "Automobile Manufacturers' Committee" by whom Moore is now employed "accelerating public sentiment" and convincing the thousand and one manufacturers—not to mention importers—who know nothing of the "committee," that if they do not have a road race for stock cars in April next, their business will simply go to the bowwows. Moore is making a manful effort to "make good," although Sweet

Digitized by Google

Charity has been slapped on the wrist and the "surplus receipts"—good old Surplus Receipts!—are to be "turned over to the county for the benefits of the taxpayers"—happy, happy taxpayers! The Morrell-Moore "manufacturers' committee" now has a map of the course, Mr. Morrell has a sanction and Mr. Moore sends word that he has three real entries. There are said to be two importers and one American manufacturer on the mysterious committee.

The other sanctions granted by the A. A. A. were issued to the Automobile Club of America, for the Florida carnival beginning March 2d, and to the Savannah Automobile Club for its series of stock car road races to be held during the week beginning March 15th.

The resolutions previously referred to and which are to be incorporated in the racing rules, were introduced by Dave Hennen Morris, and seconded by Robert Lincoln Lippitt.

Why New York Has Many Poor Roads.

Every citizen of the State of New York is so used to feeling proud and asserting that his State is the wealthiest State in the Union, that to him the facts in regard to the condition of the highways of the State will seem strange. The 933 towns in the State into which the counties are divided, are charged by statute with the care and maintenance of the highways and bridges existing in each town. The total mileage of highways cared for under this statute is 74,000 miles. The average tax levy in each town for the entire State is $44 per mile. The total highway tax levy in money and labor is $3,284,000, a very large sum of money, until one realizes that this money is only to care for the highways between the melting of snow in the spring and its return in the fall, and that $44 a mile means that each highway commissioner has eight miles with which to care for and maintain each foot of highway in the town during the season. With this money he must grade it, turnpike it, put on permanent material, build sluices under five feet, remove the loose stone, and keep it smoothed from ruts. It is every evident that both under the labor system and the money system alike, no permanent improvement can be made in the highways of the State except in the very rich towns, unless the highway system is changed.

Organized to Promote Touring.

To promote touring among members of their own set several socially prominent young New Yorkers have formed the Motor Car Touring Society of the City of New York, a certificate of incorporation having been filed with the Secretary of State. Albert Eugene Gallatin is named as president; Percy R. Pyne, 2d, as vice-president, and Orme Wilson, Jr., secretary-treasurer. These with Stuyvesant Fish, Jr., and Marshall R. Kernochan constitute the incorporators.

THIRTY-ONE WERE PENALIZED

Only Eight Contestants in Quaker City Endurance Run Made Perfect Scores—Bad Roads Partly to Blame.

Eight perfect scores out of thirty-nine starters in the two main classes tell the story of the wholsale elimination of possible clean records in the second annual endurance contest of the Quaker City Motor Club in its run from Philadelphia to Allentown, Pa., yesterday, New Year's Day. To the unfavorable condition of the roads on the second control of the run was due the many black marks.

Starting in the morning with every indication of an uneventful and parlor-car trip, the run proved to be one of the most strenuous and exacting ever arranged by the energetic Quaker City organization. With a twenty miles an hour schedule that was easy as far as Doylestown, the contestants followed a trail of confetti over a system of highways that are a standing disgrace to the State. Coupled with the necessity of careful and slow operation came that constant bugbear—tire trouble. The unresisting frozen mud crust that held what seemed to be an unusually large crop of nails, served to flatten many a good full blown tire, and played havoc with scores of the unfortunates. When the committee ceased its arduous labors at Allentown late in the evening, but six cars remained as perfect bidders for the MacDonald and Campbell trophy.

The six drivers in the touring class that finished the first day with perfect scores are C. W. Hoffman, Stearns; T. W. Berger, Oldsmobile; Frank Yerger, Studebaker; Robert Shirk, Stoddard-Dayton; Hal K. Sheridan, White; and Frank Leflen, Garford. Owing to the failure of several checkers to turn in cards the results of several other cars have not been computed.

Two drivers survived in the division for high powered runabouts—J. Trumbull, Packard, and Samuel Collum, Stearns. In Class C, for small runabouts, which check in only at morning and night, no results have been announced, and in Class D, the go-as-you-please division, which do not report to checkers, the winner will be decided after the finish to-day by a vote for the most popular driver in that section of the endurance brigade.

That the test on Wednesday was a truly hard one is agreed to by all those who participated in it. The bad roads on the latter part of the journey were responsible for many late arrivals and consequent loss of points. There was but one accident and that proved not serious. While trying to make up schedule time H. P. Fry pushed his Columbia car to the limit. Three bad water-breaks did the rest, and Hugh Coyle, the mechanic, was bounced out of the seat. He landed on the hard ground face first, and was rendered unconscious for twenty minutes. Although shaken up quite badly and with his face cut and bruised, Coyle announced his determination to return with the car to Philadelphia. William Cathcart's Corbin sideswiped a bridge and broke its mudguards, but that was all, though quite sufficient to make Cathcart "bless" the roads that caused him to lose points.

The worst roads were met with between Doylestown and Ottville, a section included in the second control. Bad at all seasons it was at its worst on Wednesday, and there were plenty of perfect scores lost simply because the drivers could not go any faster than ten miles over the deep frozen ruts that prevailed. With the exception of a few miles between Easton and Nazareth, where the road was soft and deep, the course was good, but these two instances of miserable highways more than offset the good ones.

To-day's run from Allentown back to Philadelphia will conclude the contest. The drivers are apprehensive on account of reports of unusually bad roads, especially in the vicinity of Kutztown. The route takes the contestants through Reading, Pottstown and Norristown, a distance of 93.7 miles. This with the distance of the first day's run—78.9 miles—will make a total of 172.6 miles.

According to the report given out last night this is the way the cars survived the first day's run:

Class A (touring cars)—O. W. Hoffman, Stearns, perfect; T. W. Berger, Oldsmobile, perfect; Frank Yerger, Studebaker, perfect; Robert Shirk, Stoddard-Dayton, perfect; Hal K. Sheridan, White, perfect; Frank Leflen, Garford, perfect; P. B. Huyette, Peerless, 1 point; Harry Michenor, Lozier, 2 points; J. P. MacNichol, Matheson, 3 points; H. F. Fry, Columbia, 4 points; A. J. King, Studebaker, 4 points; H. B. Shade, Pullman, 7 points; H. B. Hill, Royal Tourist, 8 points; C. E. Titman, Matheson, 8 points; Bert Maucher, Peerless, 10 points; William Crawford, Franklin, 11 points; A. J. Martin, American Mors, 15 points; Robert Autschenfelter, Autocar, 18 points; Webb Jay, Kisselkar, 25 points; J. A. Moran, Stevens-Duryea, 23 points; W. Cathcart, Corbin, 39 points; C. A. Percival, American, 68 points. The following drivers had not handed in cards: H. K. Knepper, Frayer-Miller; Maylin Leinau, Acme; N. J. Fox, Locomobile; H. W. Greenwalt, Mitchell, and J. W. Florida, Locomobile.

Class B (high-powered roadsters)—J. Trumbull, Packard, perfect; S. H. Collum, Stearns, perfect; Robert Morton, Pullman, 3 points; E. T. Youse, Thomas, 5 points; Stewart LaFear, Pullman, 7 points; A. A. Jones, Ford, 11 points; P. E. Varney, Oldsmobile, 75 points. The following drivers had not handed in cards: Robert Maynes, Autocar; Thomas Wilkinson, Packard; Willian Henry, Ford; J. W. Parkin, Jr., Packard, and William Haupt, Columbia.

SHOWING A CUSTOMER HIS NEEDS

Getting Back at Him with His Own Specifications—An Illustration of Fine Art in Selling.

There are many kinks in the slender thread which the salesman must follow in order to secure his orders, but few which cannot be unraveled by close familiarity with the workings of the human mind and that peculiar constructive faculty of argument which enables the successful merchant to offer the customer a fabric of reason exactly suited to his comprehension and tastes. The man who adds psychology to his selling equipment and uses it judiciously in displaying his technical and worldly wisdom, is he who not simply takes orders, but delivers the goods on the one hand, and the cash on the other. A striking case in point is related by A. J. Banta, who frequently has occasion to exercise this trait in the management of the Chicago Branch of the Locomobile Co., of which he is in charge.

Not long since, Banta had occasion to take on a new salesman, and for the purpose chose a man of considerable business experience and evident stability, who had at one time been possessed of means and was supposedly thoroughly conversant with the type of man with whom he would have to deal in connection with the Locombile business. After this man had been at work several days he interviewed him in an effort to discover how he was getting on. It appeared that in one particular instance, he had called upon a well known architect several times, had been well received, and had never failed to obtain a hearing, but had come away each time without arriving at any definite conclusion.

"Does he really want to buy a car?" asked Banta.

"Why, yes."

"Does he know what kind of a car he wants?"

"Yes, in a general way."

"Have you discussed the horsepower with him, the color and equipment, and fittings, definitely enough so that you know his tastes pretty well and understand about what his idea of a car would look like?"

"Yes, I think so"—and he proceeded to run over the matters which they had considered.

The upshot of it was that in the afternoon the salesman called on the architect and presented him with a regular contract form for the delivery of a car, with every detail closely specified. Under instructions from his chief, he merely laid the form on the customer's desk and asked him to look it over and sign, after making any alterations he saw fit.

At the end of five minutes the contract was signed and delivered over to the elated salesman, and then the architect swung about in his chair and said: "There, now you have given me something to work on and put it in a way that I can grasp. You see a man in my profession is accustomed to seeing things in black and white. My mind is filled with a hundred and one things and it is next to impossible for me to carry all the details of anything clearly in my mind. Here, you give me my ideas in the form in which I am accustomed to deal with them. I know what I want and what I don't want, but I have neither the time nor the energy to summon those ideas and give them to you in so many words. I don't pretend to say you might have closed with me at once if you had brought this to me in the beginning, but I do say you would have stood but a small chance if you had kept on trying to make me remember and tell you what I wanted and how I wanted it fixed."

Alcohol as Fuel for Heavy Trucks.

By raising the compression of the motor from 78 pounds to 112 pounds, and putting a hot water packet around the intake manifold, the Hewitt Motor Co. has adapted one of its five ton gasolene trucks for use with alcohol. A demonstration of a truck so fitted was given last Saturday from the company's salesrooms on East Thirty-first street, New York. The vehicle was equipped with a regular gasolene carburetter, and beyond fitting the latter with an intake arranged to heat the air as it enters there was no special preparation other than the changes mentioned. The motor compression was raised by using longer pistons with dome shaped heads.

The truck for its alcohol demonstration bore a flat body on which was placed a row of boxes fitted with seat cushions for the benefit of those wishing to ride along with it. About 1,000 pounds of sand in bags was carried. The first day's run demonstrated the flexibility of the motor with alcohol fuel, while tests were conducted a few days later with a full five ton load to show that the change in fuel does not lessen the capacity of the truck. The motor is rated at 32 horsepower and has four cylinders, 4¼ by 5½ inches. It starts cold on denaturized alcohol, with Simms-Bosch ignition.

The flexibility was proved by the fact that the motor could be run fast or slow quite as easily as with gasolene. The truck was driven through city traffic with no more numerous changes of gear than with gasolene, and as far as could be observed, there was no practical difference in the use of the two fuels. The exhaust with the alcohol was colorless, but very pungent, if not stimulating. Beyond the fact that the vehicle bore a cloth sign proclaiming it as a "5 ton alcohol truck," the passerby could not distinguish it from a regular gasolene truck, which it was except in the matter of the slight alterations noted.

INDICATING SPEED BY COLORS

Unique Foreign Device to Aid in the Prevention of Scorching—Features of Its Mechanism.

It is several years since the proposal to regulate the speed of motor vehicles by means of indicators more or less under the jurisdiction of governmental authorities was first heard abroad. A system invented on German soil was then described as showing the speed at which any vehicle was traveling by means of colored discs visible for some little distance in front of and behind it. That this idea is still extant is shown by a recent report from American Consul H. Albert Johnson, of Liege, who describes the difficulties encountered by the police in obtaining evidence of violations of the speed law and outlines the method by which it is hoped to overcome them.

"The demand for a reliable and accurate speed register has been met by a Belgian inventor, who has devised an apparatus which, in the experimental trials now taking place gives entire satisfaction," he says. "This apparatus consists of a box placed in the forward part of the vehicle, directly in view of the chauffeur, and containing certain machinery that is connected to the axle by a flexible rod that transmits each revolution of the wheel to the registering apparatus. The mechanism is arranged to mark three different rates of speed; that is, 15, 30, and 60 kilometers (9.32, 18.63, and 37.26 miles) per hour, indicated respectively by a white, red and blue disc. Thus when the car is running in a town where the speed limit does not exceed 10 kilometers, the white disc is the one that should be visible; if running in the country, where the speed limit is 30 or 60 kilometers, then either the red or blue disc should be seen. In this manner the moment a car is near enough to permit of the disc being seen the rate of speed is known.

"If so desired the car can be stopped and the rate of speed, as indicated by the disc, can be verified by an examination of the register, which is arranged to indicate by means of an endless revolving ribbon connected with the mechanism, the exact rate of speed. This perforated band or ribbon may be demanded by the controlling authorities as often as may be deemed advisable, say once every month, and all indications of having exceeded the speed limit, which the ribbon would have registered could be noted.

"Of course the box containing the registering mechanism would be closed and sealed in such a manner that neither the chauffeur nor the owner of the car could open it nor take out the registering ribbon without the intervention of the authorities having control of such matters."

SEVERE SENTENCE FOR A MOTORIST

Why His Plea of Guilty Failed to Save Him from Imprisonment—He is Heavily Fined as Well.

A jail sentence of three months at labor in addition to a fine of $1,000 was meted out to George Meserve Weatherbee, of 26 Chester avenue, Waltham, Mass., 26th inst. Weatherbee, who is a member of the firm of Weatherbee & Smith, automobile dealers of Boston, pleaded guilty to running down with his automobile and causing the death of Warren F. Batchelder, of Cambridge, on the night of May 5th, at the corner of Western and Putnam avenues, Cambridge. The sentence is, so far as known, the heaviest ever inflicted in Massachusetts for an offense of the kind.

When the case first came up in the last term of court Weatherbee pleaded guilty to a charge of manslaughter, but sentence was suspended until the present term of court, the dealer in the meantime being held under $10,000 bonds. When the case came up last Thursday, Captain Hurley, of the Cambridge police force, made a statement of the facts in the case. He told how Batchelder left a street car on the morning of September 6th, and of his being struck by Weatherbee's automobile. He said that Weatherbee never slackened his speed, but hurried away from the scene of accident, without attempting to find out if the man he struck was seriously hurt. Weatherbee later was discovered by Hurley's lieutenants, after the automobile had been found in a Newton stable. The arrest was made at the garage run by Weatherbee in Boston.

District Attorney Arnold Scott, for the State, made an address, citing the circumstances, and asked Judge Hardy to impose a sentence of three months in the house of correction in addition to a fine of $1,000. Attorney Proctor pleaded that only a fine of $1,000 be imposed. Judge Hardy, however, considered that the request of the district attorney was very moderate. He said that if it had not been for the energies of the police Weatherbee would still be at large; that it was through no desire on the part of the prisoner that he was before the bar. The court continued that the prisoner evidently had not stopped to see how severely he had injured the man, or to offer any aid, but that his one object seemed to be to get away from the scene of the accident. Following which remarks he imposed a sentence of three months in the house of correction and a fine of $1,000.

Weatherbee bore up well under the ordeal and after paying the fine walked with a court officer across to the jail. He has a wife and three children, the youngest only about one month old. After being locked up in the receiving cell Weatherbee was given a suit of the regulation attire. The Boston dealer will have to work in the machine shop of the institution for the next three months, and will be accorded no privileges not allowed other prisoners, who have to arise at 6 a. m., make their beds, wash the cell and put everything to order, and after breakfast of bread and coffee at 7 o'clock, work until noon. Dinner consists of soup and bread. After dinner Weatherbee will have to work until dark, when he will receive a supper of tea and bread. The only food delicacies that he can have sent to him from the outside world are fruits. After supper he may read or take other recraetion in his cell until 8 p. m., when the lights are put out.

Bay State Law Makers Busy Again.

Promptly on the first day of the new year the Massachusetts legislature entered upon its annual task of grinding out new laws and putting a fresh edge on old ones. The job usually eats up about half of the year, leaving the other half for political campaigning. Consequently, Massachusetts has more law to the square inch than any other State in the Union.

Of course the automobile, with its owner and its driver, shares the attention of the ambitious city lawyers and the bucolic wiseacres who constitute the largest elements in the composition of "the Great and General Court." There will be no exception in this respect this year. Suggestions for automobile legislation are promised from various sources. One of the most noteworthy will be in the form of a measure that has been in process of incubation in the Safe Roads Automobile Association, in which Colonel William D. Sohier is the leading spirit. It is intimated that this association will ask for a provision of law under which a court may, at its discretion, impose the penalty of imprisonment in cases of flagrant violation of the requirement concerning the display of number plates.

Chicago Show "Bouncers" Fined.

An echo of the Chicago show was heard in the Harrison street court, that city, last week when Judge Newcomer fined four men, employed at the show, for forcibly ejecting Elton Lower, a prominent Chicagoan, after he had paid his admission. Lower testified that he had paid admission for himself and his wife and had left the main building to visit the exhibits in the annex. When he attempted to return to the main building, he declared, he was stopped by one "Sig" Hart, who called Alfred Beaumont, in charge of the ticket takers. Beaumont, it is stated, ordered Hart, Henry Barstow and Jacob Bunge to eject Lower from the building, which they proceeded to do in no gentle manner. Lower had the four arrested on an assault and battery charge and Beaumont was fined $50, Hart and Barstow $5 each, and Bunge $1, the latter not having taken such a strenuous part in the proceedings.

DANGEROUS JERSEY ROADS MARKED

What is Done with Part of the Money Exacted from Motorists—Sign Boards to Promote Safety.

At least some of the money New Jersey takes from the motorist in the form of license fees is devoted in part to the promotion of his safety on the roads in that State. "Go Slow," is big letters on a black signboard placed at the right hand side of the road is the warning that greets him wherever danger lurks. During the past year $4,000 of the income derived from license fees has been expended in placing such signs at places that were considered perilous. An unusual number of them are to be seen in the southern portion of the State near the seashore resorts.

Wherever a bad stretch of roadbed exists, wherever there is an especially sharp turn, wherever some hidden bridge, uncertain passage through a woods, or anything that would endanger the motorist in the least there a signboard has been erected.

The boards have been put at such an elevation and at such a distance from the danger spot that they are visible a long distance away, and the motorist running at top speed is given time to slow down before he reaches the section of the road where danger exists.

Nearly all of the railroad grade crossings have also been protected in a similar manner, but here a larger sign with the warning "Railroad Grade Crossing—Listen" is placed. The many crossings in South Jersey and in the northern part of the State as well are now guarded in this manner, and where the crossing is considered more than ordinarily dangerous the "Go Slow" sign has also been added. The work is to be continued and will extend more largely toward the northern and eastern portions of the State than it has thus far extended.

Toledo Organizes Its First Club.

Although Toledo, Ohio, has a population of about 150,000, strange to relate, until within a week ago it could not boast of an automobile club. Several automobile owners got together, formed an organization committee, resulting in the formation last week of the Automobile Club of Toledo, with 125 charter members. The club will pay particular attention to the subject of good roads, and announces that it will assist the authorities in enforcing laws governing the use of motor vehicles. The officers elected are: President, E. D. Libbey; vice-president, E. J. Marshall; treasurer, J. M. Steenberg; secretary, George S. Mills; governors, the officers, Marshall Sheppey, W. W. Morrison, John Mockett, J. J. Manning and F. M. Brigham.

The Week's Patents.

866,238. Power Transmission Coupling Device. Antonio M. Van Halen, Madrid, Spain. Filed June 3, 1907. Serial No. 377,003.

1. In combination, a driving shaft, a sleeve surrounding said shaft and provided with a non-rotatively and slidably mounted flanged collar, means for shifting said collar, a pulley loosely mounted on said shaft and provided with a band receiving recess, a coupling band for said recess, an arm rigidly mounted on said shaft, means connecting said arm with one end of said band, a crank shaft mounted in said arm and connected with the other end of said band, an actuating member carried by said arm and traveling freely between the flanges of said collar, and a threaded connection between said actuating member and said crank shaft.

866,241. Ignition System for Explosion Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed Nov. 13, 1906. Serial No. 343,179.

1. A means for starting explosion engines with an electrical ignition system, comprising an auxiliary generator having a foot pedal, and means whereby said generator is automatically cut into the ignition circuit when said pedal is depressed.

866,254. Change Speed Lever for Automobiles. Charles W. Berry, Portland, Me. Filed Jan. 2, 1907. Serial No. 350,342.

1. The combination with a change gear lever, notched segment and pawl for motor cars of an auxiliary lifter for disengaging the pawl, an operating handle for actuating said lifter and means for tripping said lifter between the notches.

866,282. Shifting and Locking Mechanism for Friction Band Clutches. James P. Karr and John D. Rauch, Loganspoit, Ind. Filed Feb. 12,1907. Serial No 357,014.

1. The combination with a rotatable shaft, a driving gear keyed thereon and a drum loose thereon and provided with a peripheral friction surface, of a friction band applied to said surface, pins passing through the peripheral portion of the gear and provided with cranks one of the pins being connected with both ends of the divided band, single and double cranks applied to the pins on the outer side of the gear, an equalizing bar connecting the single crank with the double one, a yoke which is slidable on the hub of the gear, toggle links and pivoted knuckles connecting the yoke with the cranks of the two pins, and a shifter for moving the yoke in and out for applying the band and locking the same automatically as shown and described.

866,294. Motor Vehicle. William J. Miller, Columbus, Ohio, assignor to The Oscar Lear Automobile Company, Columbus, Ohio, a Corporation of Ohio. Filed Jan. 23, 1907. Serial No. 353,729.

1. A motor vehicle comprising an under frame construction, a cab body mounted thereon, a rearward extension upon said cab body, a platform at the upper side thereof, an elevated seat supported on said platform, means within easy reach of said seat for controlling the operative parts and the brakes on said vehicle, the connections between said means and said under frame construction for controlling said operative parts being housed within said extension.

866,488. Variable Speed Gearing. James G. Lambert, Hadleigh, and Benjamin E. Waddams, Ealing, England. Filed March 9, 1907. Serial No. 361,469.

1. In a variable speed gearing, the combination with the driving and driven shafts, of a worm mounted loosely on the driven shaft, a clutch for coupling said wheel to said shaft, a plurality of worms of the same diameter and normal pitch but each having a different number of threads, the said worms being all mounted on a sleeve free to slide on but rotate with the driving shaft, means for locking said sleeve in the several positions to retain the worms in their operative positions, and means for disengaging the clutch, as set forth.

866,537. Pneumatic Spoke Wheel. Arthur H. Thibault, Valparaiso, Ind. Filed Oct. 13, 1905. Serial No. 282,606.

1. A wheel comprising a sectional rim the outward movement of which is confined within the maximum normal circumference of the wheel, and pneumatically cushioned spokes each consisting of telescopic members and a packing interposed between the head of the inner member and the closed end of the outer member.

866,539. Repair Device for Pneumatic Tires. Philip C. Travers, New York, N. Y., assignor to Michael P. McNamara, New York, N. Y. Filed July 26, 1906. Serial No. 327,929.

1. A protecting device for the inner tube of a pneumatic tire comprising a relatively rigid body member having a flange on that edge thereof contiguous to the heel of the tire casing for engagement with said heel and having the other edges of said body member curved outwardly for engagement with the inside of said tire casing and for protecting the inner tube against abrasion by said edges.

866,540. Vehicle Wheel. Horace Villiers-Stuart, Louisville, Ky. Filed Dec. 10, 1906. Serial No. 347,147.

1. In a wheel, the combination of radially movable tire-segments, connections whereby the radial displacement of one segment is similarly transmitted to all of the other

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—Model K Cadillac runabout, excellent condition, complete with top, lamps and generator. THE HARTFORD RUBBER WORKS CO., Hartford, Conn.

A BARGAIN—1907 20 H. P. 4-cylinder Model "G" Cadillac runabout, best of condition; demonstration at any time. Address MORGAN & WRIGHT, 214 W. 47th St., New York City.

FOR SALE—Absolute closing out sale of the largest stock of new and second-hand automobiles in the United States. Write for Clearance Sale List No. 21. Now is the time to buy. ROCHESTER AUTOMOBILE CO., Jos. J. Mandery, Prop'r., Rochester, N. Y.

FOR SALE—$100 to $500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from $640 to $1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

segments, and cushioning devices for automatically returning the segments to normal position.

866,631. Sparking Plug for Explosive Engines. William Diebel, Philadelphia, Pa. Filed July 13, 1906. Serial No. 326,010.

In combination, a body having a threaded upper end, the threaded lower portion having a small opening therein, a sparking point extending inwardly from the wall of the lower opening, a shoulder in the body, a heat insulating washer resting on the shoulder, a porcelain insulator fitting to the bore of the body and resting on the washer, said washer and porcelain insulator having coinciding apertures, and said insulation terminating at the washer, a conductor extending through the aperture of the insulator and washer having a sparking point terminating near the sparking point in the wall of the body and a threaded collar in the body to bear on the porcelain insulator.

866,693. Rotary Explosion Engine. John F. Southern Wilmington, Del., and Henry J. Griest, Chester, Pa.; said Southern assignor to said Griest. Filed April 27, 1904. Serial No. 205,111.

1. In a rotary explosion engine, a revolving piston, an annular cylinder in which the piston revolves, a piston carrier concentric with the annular cylinder and with a semicircular concave cross section, intersecting the annular cylinder and fitting the concavity of the piston holder, and an opening in the abutment to permit the passage of the piston, substantially as shown and described.

866,976. Rocker Bar Gear for Vehicles. George W. Stevenson, Reading, Pa., assignor of one-half to Milton H. Schnader, Lebanon, Pa. Filed Sept. 26, 1906. Serial No. 336,250.

1. In a vehicle, a resilient support for the frame of the body thereof consisting of a rocking bar which is interposed between said frame and the axle of the vehicle and resting upon the latter and endwise compressible springs bearing against the opposite ends of said bars in reverse direction.

866,980. Chain. Arthur B. Taylor, Indianapolis, Ind. Filed June 28, 1905. Serial No. 267,379.

1. A chain composed of a plurality of successive pairs of links, the inner link of a pair comprising two cross bars and an intermediate connecting member, and the outer link of a pair comprising two cross bars each passing through an inner link between the two cross bars thereof, and also comprising a pair of side bars which connect and are permanently secured to the cross bars of said outer links, the adjacent faces of each pair of cross bars being formed to co-operate with a transversely removable intermediate compression member, said transversely removable compression member being at all times accessible at one end without dismembering the links.

866,986. Wheel Rim. John K. Turton, New York, N. Y. Filed Sept. 22, 1906. Serial No. 335,706.

1. In a wheel, the combination of a felly, a rim extending around the same, a tire extending around the rim, said rim being expansible and contractible, and means permanently carried by the rim and operating on both sides of the rim simultaneously for effecting the expansion and contraction of the rim, substantially as described.

867,057. Vehicle Brake. John M. Lansden, Jr., Orange, N. J. Filed Oct. 14, 1904. Serial No. 228,418.

1. The combination with an axle having a squared portion, brake blocks engaging therewith, means for elastically engaging and for separating the brake blocks, the said brake blocks having an opening of hexagonal shape through which the axle passes, whereby the brake will be self-centering.

867,075. Internal Combustion Engine. Otakar Podhajsky, Warren, Pa. Filed Nov. 27, 1906. Serial No. 345,287.

1. In an internal combustion engine, a cylinder, and a removable cylinder head of substantially cylindrical form whose diameter is equal or greater than that of the cylinder bore, the outer surface of the cylinder head being provided with a plurality of shoulders fitting against similar shoulders on the cylinder bore; one of the valves controlling the cylinder being provided with a passage controlled by said valve and registering with a passage in the cylinder bore, substantially as described.

867,122. Gas Engine Starter. Raleigh W. Godfrey, Elyria, Ohio, assignor of one-half to H. F. Thompson, Lexington, Ohio. Filed March 23, 1906. Serial No. 307,603.

1. A gas engine starter having a tubular pump barrel, a liquid receptacle mounted on said barrel and having an orifice opening into said barrel, a plunger in said barrel adapted to traverse said orifice and a heating pan on the bottom of said barrel beneath said receptacle.

867,211. Circuit Making and Breaking Device. Andrew L. Riker, Bridgeport, Conn., assignor to The Locomobile Company of America, New York, N. Y., a Corporation of West Virginia. Filed Jan. 18, 1904. Serial No. 189,421.

1. A circuit making and breaking device provided with a contact member and impact means for enforcing the making of the circuit.

867,207. Fly Wheel Construction for Gas Engines. Archibald J. McCollum, Chicago, Ill., assignor to Armac Motor Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 21, 1906. Serial No. 348,855.

1. A fly wheel, said wheel being constructed of two discs each of which has an annular rib at its periphery, an outwardly extending boss located on each of said discs, there being a taper socket is said bosses, an outwardly extending hub at the center of each of said discs, a rod mounted in each of said hubs whose external diameters are coincident with the external diameters of the hubs, each rod having means for securing and holding it in position, and a steel sleeve fitted over each rod and the exterior surface of the adjacent hub, for the purpose set forth substantially as described.

867,271. Automobile Heating Appliance. Paul P. Hofmann, Chicago, Ill. Filed Dec. 15, 1905. Serial No. 291,854.

1. In combination with an automobile comprising a body, an engine, a part through which the engine exhausts, heated by such exhaust and located at a level below the body, a jacket arranged to conduct air into such proximity to the exhaust heated part as to be heated thereby, a flue leading upward from said jacket into the body, said jacket and flue forming an air passage, and one of said parts being provided with an air escape opening to a point without the body; and means operable from within the body for regulating the passage of air through said flue and said escape opening.

867,279. Explosive Engine. Martin C. Kessler, Denver, Colo., assignor to The Kessler Motor Company, Denver, Colo. Filed Sept. 17, 1906. Serial No. 334,926.

1. In an engine in which air is compressed in the crank case, means for controlling and varying the volume of air delivered from the crank case to the engine cylinder with each alternate revolution of the crank shaft.

867,282. Steering Gear for Automobiles. Walter W. Macfarren, Pittsburg, Pa., assignor to Wm. H. Donner, Pittsburg, Pa. Filed March 9, 1907. Serial No. 361,623.

1. In a motor vehicle, the combination of four wheels, a fluid pressure supply, and means for steering either the front or rear wheels independently or simultaneously by the application of said fluid pressure.

867,285. Automobile Sleigh. William C. Mielke, Parkers Prairie, Minn. Filed April 16, 1906. Serial No.

1. In a device of the class described, a body, a rear sled secured to the said body, a forward sled formed of a frame slidingly mounted relative to the said body, and provided with runners means for forcing the forward sled forwardly, and the body and rear sled forwardly while the forward sled is retained at its forward limit of movement a steering segment secured to the forward sled, and means for operating said segment.

867,324. Power Transmission Device. Edward P. Warner, Chicago, Ill., assignor, by mesne assignments, to Warner Clutch Company, a Corporation of Illinois. Filed Aug. 15, 1906. Serial No. 330,730.

1. A power transmission device comprising a power shaft; a driven shaft; a friction member connected to said driven shaft and means having a longitudinal reciprocal movement independent of said driving and driven members whereby it is adapted to engage said friction member commencing at one end of the same and advancing to the other end thereof.

867,419. Turbine Adapted for the Use of Combustible Gases at very High Temperatures. Charles Rollin, Newcastle-upon-Tyne, England. Filed Jan. 16, 1907. Serial No. 352,612.

1. In gas turbines used for producing motion from the combustion of gas and air, the combination of an outer revolving structure or "rotor," consisting of refractory material, with an outer metallic casing, and an inner stationary structure or "stator" formed of refractory material.

867,551. Universal Joint Casing. Fred H. Bogart, Hartford, Conn., assignor to Hartford Automobile Parts Co., Hartford, Conn. Filed Oct. 15, 1906. Serial No. 338,886.

1. In a universal joint casing of the class described, an inclosing casing therefor comprising elements adapted to be secured to the bearing pieces of the joint, and having openings therethrough, there being cylindrically shaped surfaces at opposite sides of the same and located in planes at right angles to each other; said surfaces surrounding the openings thereof, and closure pieces also having cylindrically shaped surfaces and engaging the first mentioned cylindrically shaped surfaces, said closure pieces being detachably secured to the driving parts of the joint.

THE CONTINENTAL AUTO MFG. CO.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

White Wins Quaker City Endurance Run

In the Endurance Run held January 1-2 by the Quaker City Motor Club, the White Steamer was the only car which made a perfect score on the road and also was declared by the Technical Committee to be in perfect condition at the finish. The Contest Committee would not abide by the decision of the Technical Committee. They gave credit for perfect scores to two other cars and ordered a "run-off."

The supplementary contest, held January 4th, served only to emphasize the superiority of the White. The examination then made by the Technical Committee placed the White far in the lead and, accordingly, the MacDonald & Campbell trophy was awarded to the White.

With our entry of one car, we decisively defeated 27 gasoline cars representing 23 different makes. Thus has another important factor been added to the long list of triumphs achieved by the White—the distinctively American car.

The Man Who Drives

The "Maxwell"

knows what it is to experience all the pleasures of motoring without that eternal "gnawing at his bankroll" as is the case with a high-priced, costly-to-operate car.

The little overdose of prosperity which resulted in the recent stringency has waked a lot of people to the fact that motor-car money's worth does not go hand in hand with fancy horse-power and exaggerated claims.

The "Maxwell" has never been a speed-car or a freak. It has never boasted hyper-horse-power.

It is, and has always been a utility—a necessity—a family car without a "frill" in its construction.

The records it has established in hill-climbs, economy and endurance tests have never been equalled by any other cars, regardless of price.

Mr. J. D. Maxwell's foresight in designing cars of unfailing efficiency, at prices well within the reach of the average citizen has been well rewarded, to judge from the universal satisfaction of the 10,000 "Maxwell" owners.

That is why these days are "Maxwell" days. Every motor-car buyer will now get a dollar's worth of motor-car for every dollar he pays, and that is just what the "Maxwell" has always given.

Among the important features which the "Maxwell" was the first to introduce, are the three-point suspension, thermo-siphon cooling and multiple-disc clutch.

That features of such prime importance should have first appeared on cars of such low price—$825 for the 14 H. P. Tourabout, $1,450 for the 20 H. P. Touring Car, and $1,750 for the new four-cylinder 24 H. P. Touring Car—is one of the most remarkable incidents of the industry, and is evidence of how far in advance the "Maxwell" line is.

Get a "Maxwell Convincer" at your convenience in any car of the "Maxwell" line. Address Dept. 2.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

Solar
Lamps "SHOW THE WAY"

Consider Solar —Then Buy Solar

Consider that SOLAR LAMP and SOLAR GENERATORS have fewer parts than any other lamp or generator produced—and that each part is of heavy drawn brass, riveted or screwed together—not soldered. And that each lamp is tested for accuracy of focus and every possible bit of light is utilized. Buy SOLAR and your automobile will be raised to the highest state of efficiency as regards lighting equipment.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, January 9, 1908. No. 15

BIG COMPANY'S NEW CONNECTIONS

Takes Output of Simplex Factory and Will Market a Line Built to Its Own Specifications.

Palmer & Singer Mfg. Co., of New York City, who for several years have taken the output of Matheson chassis, which contract was relinquished a short time ago, finally have completed re-arrangements which promise to put them in an even stronger and enlarged position in the trade.

As a leader, they have contracted to market the Simplex, which will be made in one model only—of 70 horsepower—listing at $5,750. The Simplex was formerly made by the Smith & Mabley Mfg. Co., Inc., which was later succeeded by the Simplex Mfg. Co. The car itself has always been considered one of the best made and highest grade of American cars, being intended to be a duplicate of the best of the foreign product and incorporating the most advanced foreign mechanical practices. The car, however, was not pushed much beyond the confines of New York and Philadelphia, and, consequently, its worth throughout the country has not been generally known or appreciated. The Palmer & Singer Mfg. Co.'s agressiveness and forceful selling methods, together with their large resources, ought quickly to effect a marked change; in fact, Sales Manager W. M. Botto started this week on a trip to the Pacific Coast during which he will visit the principal cities en route in the interests of the company's new goods. Previous acquaintance with the territory will assist in facilitating his mission.

In addition to the Simplex, the Palmer & Singer company will handle a full line of cars which are to be known as "P & S", and which are being made expressly to their specifications; the line will include a six-cylinder runabout, a touring car and a town car. These P. & S. cars will be secondary to the Simplex in the matter of price only, as Palmer & Singer have their own engineering staff and know the requisites of a high grade car.

Importers' Show Proved Unprofitable.

Despite its surpassing beauty and conspicuous and rose colored newspaper mention, the New York public refused to the end to "warm up" to the Importers' Salon which closed its run in Madison Square Garden, New York, on Saturday evening last. The attendance was meagre throughout. It is doubtful if there were more than 5,000 paid admissions during the eight days and it is practically certain that the entire attendance was less than 10,000. According to unofficial reports, the importers are facing a deficit of about $10,000.

Burke to Manage Mora Branch.

Because of a desire to figure more largely in the metropolitan trade, the Mora Motor Car Co. has decided to establish a branch in New York City, probably at Fifty-second street and Broadway. W. W. Burke, former manager of the Electric Vehicle Co.'s New York branch, and latterly president of the Motor Parts Co., already has been engaged to manage the Mora depot.

Counselman Rejoins Chalmer's Staff.

Lee Counselman, who for seven years was in charge of the National Cash Register Co.'s publicity work, has become sales manager of the E. R. Thomas Detroit Co., thereby rejoining his former chief, Hugh Chalmers, who only recently became president of the Thomas Detroit company. Counselman has traveled far and has owned no less than ten different automobiles.

To Push Continentals in California.

E. L. De Camp, formerly with the New York office of the Packard Motor Car Co., has relinquished that position to take charge of the Continental Tire interests on the Pacific coast as general western representative. He will establish his headquarters at San Francisco.

NEXT A. L. A. M. SHOW IN JANUARY

Decision Reached at a "Forceful but Temperate" Meeting at Which There Was "Something Doing."

What one of those in attendance described as "a forceful but temperate" meeting of the Association of Licensed Automobile Manufacturers occurred in the New York offices of the organization on Tuesday last, 7th inst.

The one item of news for general consumption that grew out of the meeting was the announcement that the next A. L. A. M. show in Madison Square Garden will occur in January, 1909. That the trade had had more than enough of the so-called "early shows" and that this decision to return to January dates was more than probable was stated by the Motor World immediately after the November exhibition. Col. George Pope, as chairman of the show committee, rendered a report of the latter function. It was not the final report, but it stated that when everything is settled a profit of at least $10,000 more than the previous show will be disclosed.

The consideration of show matters was not, however, wholly responsible for the morning session that was prolonged until nearly 3 o'clock p. m., nor for the night session that followed. It had been whispered that there were those members who considered that the association was being too expensively maintained and who also were of opinion that a reduction of the royalty exacted under the Selden patent was desirable and possible; and that these members aired their views and that it was due to the discussion of those subjects that the meeting was so prolonged and forceful there is no doubt. Naturally the proceedings were of an executive character, but it is known that the matter of royalty reduction was referred to the executive committee of the association, who are to take up the subject with the receivers of the

Digitized by Google

Electric Vehicle Co., the owners of the Selden patent, who receive three-fifths of 1¼ per cent. royalty that is paid by the members. As the Electric Vehicle Co. now is in the hands of the court, it would appear that any steps that may be taken of necessity will be unusually complicated.

It is also understood that interest was added to the occasion by the efforts of one of the eastern members to have himself placed on the executive committee.

The meeting also accepted two resignations that were tendered—those of Marcus I. Brock, assistant general manager, and C. A. Wardle, head of the agency department.

The gathering was unusually well attended, those present being as follows: W. F. Clarke, Autocar Co.; William E. Metzger, Cadillac Motor Car Co.; H. S. Hart, Corbin Motor Vehicle Co.; H. S. Lloyd, Electric Vehicle Co.; B. A. Baker, Elmore Mfg. Co.; H. H. Franklin, H. H. Franklin Mfg. Co.; C. H. Haynes, Haynes Automobile Co.; E. R. Hewitt, Hewitt Motor Co.; E. H. Cutler, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Company of America; H. A. Lozier, Lozier Motor Co.; C. W. Matheson, Matheson Motor Car Co.; V. M. Gunderson, Northern Motor Car Co.; F. L. Smith, Olds Motor Works; H. B. Joy, Packard Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; Charles Clifton, George N. Pierce Co.; A. L. Pope, Pope Mfg. Co.; George Pope, Pope Motor Car Co.; E. D. Shurmer, Royal Motor Car Co.; G. E. Mitchell, Alden Sampson, 2d; R. H. Salmons, Selden Motor Vehicle Co.; E. McEwen, F. B. Stearns Co.; C. C. Hildebrand, Stevens-Duryea Co.; Hayden Eames, Studebaker Automobile Co.; E. C. Morse, E. R. Thomas Motor Co.; E. P. Chalfont, Waltham Mfg. Co.; Thomas Henderson, Winton Motor Carriage Co., and M. J. Budlong, general manager.

Chicago, too, Abandons Early Show Idea.

Chicago also has had enough of "early shows," and as a result the Windy City will return to the old order of things, which means that the next show there will occur during the first week in February, 1909. The show subject was brought up at the meeting of the executive committee of the National Association of Automobile Manufacturers in New York yesterday and was immediately disposed of by being referred to the show committee, which later agreed to recommend that the next Chicago show be held two weeks after the exhibition in Madison Square Garden, New York. H. E. Coffin, representing the E. R. Thomas Detroit Co., was elected a member, being the first to pay the new initiation fee of $500.

At the request of the American Automobile Association, S. D. Waldon and Windsor T. White were appointed to represent the N. A. A. M. in an advisory capacity, and these two, with H. O. Smith, were appointed a committee to attend the meeting of the A. A. A. touring board.

BASIC CLAIM FOR WIRE ANTI-SKIDS

New York Inventor Unearths Ten Years' Old Patent and "Gets Busy"—Goodrich Takes Out License.

What is claimed to be the basic patent on wire tread, anti-skid tires has been brought to light by the inventor, Calvin Thayer Adams, of New York. It is numbered 609,320, and was issued August 16, 1898, the application having been filed December 26, 1895, and Adams, through his attorney, Alfred Wilkinson, already has been successful in having his patent recognized by the B. F. Goodrich Co., to whom a license just has been granted. Mr. Wilkinson promises that suits now will be promptly instituted against all infringers.

In his patent Adams claims as his invention "the combination, with a cushioned vehicle tire, of a tread applied to the entire periphery of the tire, and having metallic wire interwoven with itself, parts of said interwoven wire lying substantially flush with the outer surface of the tread, and forming cushioned antislip bearings covering the sides and bottom of the tread."

"To apply my invention to an ordinary rubber pneumatic tire,"—to quote the languare of the patent—"I prefer to employ a separate tread composed of a strip of rubber fabric or other appropriate material, which I provide with a peripheral succession of hard metallic bearings by, in this example of my invention, weaving or stitching therethrough copper, iron, or other suitable metallic wire in lines running lengthwise of the tread, so as to lie partly on the surface of the strip and substantially flush with the surface thereof. I then stretch and cement the strip thus fitted around the tire, so that it will be integrally united and incorporated therewith. The exposed portions of the interwoven wire will thus form hard bearings, which will bear on the roadway and effectually prevent the wheel from slipping thereon when the roadway is wet and at the same time will spring inward with the tire to allow the yielding material of the tread to bear on the roadway and act as a cushion in the ordinary way. The wire being interwoven with the material of the tread, will remain securely therein even when exposed stitches are worn off, and the exposed ends of the wire will act in the same way as hard bearings to prevent the wheel from slipping."

No Schwab Offer for Pope-Toledo.

Associated Press dispatches from Toledo stating that after "a stormy session between the receivers of the Pope Motor Car Co. on one side, and the creditors and local business men on the other, the receivers agreed to grant Joseph M. Schwab an option on the Pope-Toledo plant," are branded by those in position to know as "absolutely false."

The Schwab alleged proposal was reported by the Motor World several weeks ago and has been "in the air" ever since. At that time the Pope people stated that Mr. Schwab never had made a definite offer for the Pope-Toledo plant, but instead had made merely a verbal proposal through a third party and, of course, receivers cannot submit verbal offers to the courts for approval. Far from refusing Schwab an option on the property, the Pope interests say that without money consideration of any sort, they gave him a ten day option, which later was extended to thirty days. Not even the color of the Schwab money has yet been seen.

The Toledo press despatches add interest to the situation by stating that "it is freely asserted here that Joseph Schwab is simply standing with or back of his brother, Charles M., in this deal and that Charles wants the property for the United States Steel Trust, who desire to have a high grade automobile to compete with a steel competitor which is also making automobiles," which seems a most unlikely situation.

"Spring Opening" for New York Trade.

That the metropolitan automobile dealers are not going into ecstacies over the spring show which those two generous oil prospectors, Messrs. Curry and Tatham, have arranged for them, was made evident at the special meeting yesterday of the New York Automobile Trade Association, when instead of a Curry-Tatham show they considered the project of holding an "Opening Week" or "Automobile Week" in the early spring. After some discussion Gen. John T. Cutting introduced a resolution that it was the sense of the meeting that an "Opening Week" or "Automobile Week" be held under the auspices of the Trade Association during the early spring. A number of those present gave their views on the subject and President Owen appointed a committee to work out the details. Gen. Cutting was appointed chairman, the other members of the committee being Col. K. C. Pardee, Richard Newton, C. R. Teaboldt, and C. W. Wurster, with E. V. Stratton, secretary of the association, secretary.

To Operate the Deere-Clarke Plant.

For the stated purpose of marketing unfinished and finished product and ultimately re-establishing the business, the Midland Motor Co. has been formed to operate the plant of defunct Deere-Clarke Motor Car Co., at East Moline, Ill. The company was incorporated last week, under Illinois laws, with $100,000 capital, the incorporators being C. H. Pope, A. E. Montgomery, C. E. White, William Butterworth and E. H. Guyer. The property of the defunct Deere-Clarke company, which was thrown into involuntary bankruptcy last September, was purchased on November 1st by representatives of the corporation formed last week.

EXPORTS FELL OFF IN NOVEMBER

But the United Kingdom and France Increased Their Purchases — Losses in Nine Geographical Divisions.

Exports in November failed to keep the pace set by the previous months and the record shows a decrease from the corresponding month of the previous year, the totals for complete machines and parts being $173,552 as against $275,759 during November, 1906.

The number of complete cars shipped was correspondingly less, too, being 99 as against 173. As for the past three years, the United Kingdom continues to be the greatest export market for American machines and the constant increase in its purchases goes on unabated, the November figures being $49,419 as against $45,076 in the previous November. France also shows its usual monthly gain, the exports to that country being $26,304 as against $18,712. The division known as Other Asia and Oceania jumps to $13,648 from $8,643. Germany and South America were the only other divisions showing gains, the remaining nine returning decreases for the month. Of the latter the most conspicuous is that of British Australasia, with a fall to $4,439 from $40,640. Mexico's decline for the corresponding months was down to $15,662 from $64,827.

For the eleven months ending with November the total shows a gain of $1,268,508 in export business over 1906, the number of complete machines for the period in 1907 being 2,721. All of the divisions except Mexico and Africa show a gain. Despite its decrease, however, the big volume of business done gives Mexico the fourth position. First position in volume of sales goes to the United Kingdom, with British North America and France running second and third, respectively.

The record in detail is as follows:

	November		Eleven Months Ending November		
	1906	1907	1905	1906	1907
Cars, carriages, other vehicles, and parts of:—					
Automobiles, and parts of	.....	.....	$2,499,010	*$2,356,110	.....

Engineers Elect Fay President.

Thomas J. Fay, of New York City, succeeded A. L. Riker as president of the Society of Automobile Engineers, at the third annual meeting and election of officers, held in New York Friday last, 3d inst. E. T. Birdsall, Rochester, N. Y., was elected second vice-president, and Henry Hess, Philadelphia, treasurer. President Fay appointed Charles B. Hayward, secretary. Russell Huff, Detroit, and F. J. Newman, Chicago, were elected managers for three years, succeeding A. H. Whiting and H. Vanderbeek, whose terms had expired. The other officers are Henry Ford, of Detroit, first vice-president, and Hiram Percy Maxim, L. T. Gibbs, H. M. Swetland, and H. E. Alden, managers.

After the election, papers were read as follows: "Automobile Hub Bearings," by Henry Hess; "Some Notes on Taper Roller Bearings," by H. W. Alden; "Usually Unobserved Refinements of Automobile Construction," by J. M. Ellsworth and Thomas J. Fay; and "Nature Hard Gears," by Thomas J. Fay. The annual dinner was held in the evening, followed by a second business session. It was decided to hold quarterly meetings hereafter, the first being scheduled for the week of the Boston show, which will open in Mechanics Building and Horticultural Hall on Saturday, March 7th.

Mensus Wooing Houston Capitalists.

A. C. Mensus, of the unidentified Mensus Motor Co., Grand Rapids, Mich., is looking for a site for an automobile factory. He was first heard of a long way from home—in Houston, Texas, where he was seeking the support of the Business Men's League.

Tincher Joins the A. M. C. M. A.

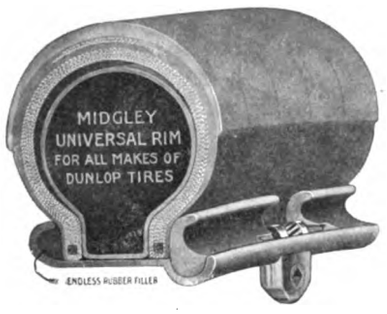
The Tincher Motor Car Co., of South Bend, Ind., has been elected to membership in the American Motor Car Manufacturers' Association. This accession makes the fifty-second name on the association's roll.

SUDDEN DEATH OF M. L. GOSS

Unexpected Outcome of Apparently Slight Accident—His Long Continued Prominence in the Industry.

What were supposed to be slight injuries, caused by a trivial accident several days before, caused the death on Friday last, 3d inst., of M. L. Goss, secretary of the Baker Motor Vehicle Co., Cleveland, Ohio, and one of the most widely known men in the industry.

On the previous Monday evening, while driving to his home, Mr. Goss's hat blew off He got out of his car to recover it and in doing so was knocked down by another automobile. The fall was not violent, however, and he picked up his hat and drove home, apparently none the worse for the mishap. He was a portly man, however, and alarming complications set in on Thursday and caused his death the following night.



Mr. Goss had been secretary of the Baker Motor Vehicle Co. since its organization. He was in his fifty-ninth year and had lived in Cleveland most of the time since 1871, when he started in the employ of the Howe Sewing Machine Co. In 1879 he went to the White Sewing Machine Co., and later became its secretary, holding that position until 1893. In the middle nineties Mr. Goss was sales manager for H. A. Lozier & Co., in the wholesaling of bicycles at Cleveland, later spending some time with the Keating Bicycle Co., at Middletown, Conn. As the automobile industry grew Mr. Goss took up the electric vehicle and has remained a prominent factor in the Baker company and in the business. He served several terms as a member of the executive committee of the National Association of Automobile Manufacturers.

Personally, Mr. Goss was of the most genial temperament and was will liked by all who knew him even passingly well. To his intimates he was long and affectionately known as "Pop" Goss. He leaves a widow and a son and daughter. His funeral occurred on Monday, 6th inst., the interment being made in Lake View Cemetery, Cleveland.

Empire Making Insulated Wire.

In addition to tires and tubes, the Empire Automobile Tire Co., Trenton, N. J., has added insulated wire to its productions. The cable of the Empire secondary wire is covered with a rubber stock designed to resist high voltage and to withstand great abuse. The rubber stock is covered with braid, and over this braid is placed a rubber stock that is absolutely oil-proof. Two braided jackets are placed on the outside. The Empire primary wire is also insulated with oil-proof rubber, and finished with two braided jackets.

To Minimize Existing Evils.

It is good that His Honor the Mayor should have seen fit to devote a portion of his annual presentment to the board of aldermen to the question of the several abuses to which the motor car is commonly loaned in the City of New York. It is to be hoped, moreover, that that august body will profit by the hint and take sane action looking toward the mitigation of each of the evils mentioned. It is more than a year since the Automobile Club of America undertook its campaign of betterment in these branches of automobile useage, and since the efforts thus expended have been only partially rewarded, it is high time more drastic measures were taken to reduce the nuisance which is fast becoming unendurable in some respects.

Thus far, the efforts of the Automobile Club have been rewarded to the extent of establishing a fine line of demarcation between the considerate and inconsiderate motorist. Hence the establishment of local measures preventing the use of the sirens within city limits, as well as the restriction of smoky exhausts, muffler cutouts and acetylene headlights can in no way be considered as an attack upon motorists as a class, but only upon those who are not alive to the objectionable nature of such practices. They cannot in any way be regarded in the light of a general hardship. European municipalities already have found it necessary to establish such regulations and they are accepted without question and enforced without difficulty. Like the speed laws, they do not hamper the legitimate use of the automobile, nor question its value as a vehicle.

As for the recommendations of special license restrictions for such of the motor vehicles as are in the public service, it is only fair to the public that such vehicles shall be under municipal control to a certain extent. The danger of too restrictive action in this respect is, of course, imminent, considering the proclivities of aldermanic bodies as a class. But there is always the opportunity of obtaining court judgment on the rectitude of any such measure, and its absence is rather more a menace to the 'bus or cab promoter than too stringent a measure would be, since it always leaves the door open for unscrupulous traffic warfare and the reckless promulgation of impossible schemes. Altogether it is to be hoped the aldermen will listen to the whole of the Mayor's advise and act upon it with all the wisdom they possess.

Promoting Efficiency of Employes.

In the "breakdown" competition recently held by a French firm operating a large number of motor cabs, is a suggestion which promises a great deal in the way of improved operating efficiency on the part of the employes. In the growing use of the taximeter cab and the commercial car of one sort or another, is found a condition which has been thrashed out over and over again in other lines of activity with varying degrees of success. It is not enough to offer work and wages to the employe and to hedge him about with restrictions of one sort or another. His interest in his work must be kept up, either through pride in his calling or through his ambition, or untidy and slipshod work is the result, with perfunctory attention to details and unfaithful service in other ways. Like the sagacious physician of the old school, the successful manager of men must administer candy and pills according to the temper of the patient quite as much as with regard to the nature of the complaint. And the administering of this moral physic to the employe is quite the most arduous and difficult task which the superintendent and his lieutenants have to face.

Unlike the motorman of the trolley car, the automobile driver must be thrown upon his own responsibility as regards keeping his machine running, once he has left the garage, and unless the mishap involves some vital portion of the machine, no "breakdown" must be permitted to interfere with the mileage account turned in at the end of the day. It is customary to give the prospective driver of the commercial vehicle as much information and training as will enable him to operate his machine under placid conditions, and as much more relating to emergencies as he is able to absorb in a few hurried lessons. Generally his training ends at that point, and unless he be ambitious, his commercial career is apt to be limited by those conditions. How then to show that type of man the possibilities for advancement within his own sphere and reveal to him a field for useful and well paid labor without skipping over to the idle and generally fruitless existence of the "choffer," is something many managers would like to know.

In the methods and details of diagnosing motor troubles appears to be a good point about which to hinge a system of training which would be both useful to the vehicle owner and interesting to the men. Competitions of the sort indicated require little effort or expense to maintain. They would serve to keep the operators thinking about the mechanical side of their work, and would prove invaluable in the way of training if properly carried out. Supplementing such tests, it might be possible to arrange a system of prizes or bonuses for the drivers who obtained the greatest mileage from their vehicles without submitting them to the repair department, or who succeeded in making the most rapid and expedient roadside repairs consistent with economical vehicle maintenance. Such a method or methods could not be carried on for any length of time without developing substantial rewards for the successful ones in the way of promotion or increased pay, and consequently, the proven result of successful competition would tend to popularize the

Digitized by Google

system. Certainly the idea holds promise and is worth following up.

Worth of the Dynamometer.

It is a source of considerable local pride that the Automobile Club of America has at length set up its long promised car dynamometer and given able demonstration of its capabilities. That it is both original and complete in its construction should further increase the satisfaction felt in its culmination. When first announced, some three years ago, it was stated that the matter of its construction had been placed in the hands of the technical committee. Since that time, however, little has been heard of it, and its development has proceeded without any blare of trumpets to herald it. Therefore its completion and demonstration come very much as a surprise to most of those who are outside the range of the gossip of the club.

It cannot be questioned that the testing plant officially put into service on Tuesday afternoon is a useful and effective one and that by its operation it will be possible not alone for the owner club members to arrive at certain information concerning their cars which hitherto has been a matter of doubt and conjecture, but also that research work can be carried on to an extent which has not been possible hitherto because of the lack of complete apparatus. Here can be developed not only the figurative "horsepower-at-the-wheels" which has cut more or less of a caper at the show booths, but also the efficiency of the transmission mechanism, the holding power of the brakes in both directions, and other indirect investigations in which the power elements is in any way considered. As these experiments may be carried on without any special preparation of the machine, it being necessary merely to run it on the rollers, make it fast and connect up the exhaust, it is evident that the inducement to close study of the questions involved in the power equation of the car is very greatly stimulated by the development of this machine.

It has been deplored again and again, that no American body possessed the facilities offered by the laboratories of the Automobile Club of France, or the Royal Automobile Club of England. This hindrance to general advancement now being removed it remains only to put the plant to proper and effective use. It is not to be supposed that an investment as great as this is said to be will be permitted to go to waste. At the same time it may be pardonable to express the hope that the use of the plant will not be confined at all closely to club members and their cars, and that the service fee be in no wise prohibitive, in the event of the plant being placed at the disposal of the public. The free and general use of such an apparatus cannot be regarded in any other light than as a public benefaction, especially when applied to an industry which is admittedly prey to so much chicanery as this. Hence it is to be hoped that the liberality evinced by the club in installing its testing plant will be extended speedily to the encouragement of proper and well ordered use of this excellent device.

Concerning the "Composite Car."

In its annual review of the closing year that venerable authority, the Scientific American discusses the progress of automobile design in optimistic vein, calling attention to the small and decreasing number of novelties which have made their appearance during the year as an indication that the approximate final type of design has been arrived at. The composite type automobile at the close of the year 1907 is described as having "a pressed steel riveted frame; a 40 horsepower, 6 cylinder engine; magneto ignition, with the jump spark in reserve; is water-cooled, with its pump driven by gears from the engine shaft; has a three or four speed sliding gear of the selective type; a cone clutch, or if not this, one of the floating disc or ring type; and the car body will be distinguished by straight lines and a general simplicity and purity of outline and coloring."

As a matter of fact, a census of the American product, taken by comparing 322 models catalogued by our own manufacturers, shows only 39 6-cylinder cars actually for sale, counting the different models produced by various makers as separate cars for the sake of comparison. This is a representation of a little over 12 per cent., while the total of 4-cylinder models amounts to near-66 per cent., double and single cylinder types coming to 16 and 4 per cent. nearly, in the respective cases. England, even, as being the home of the 6-cylinder movement as a significant manufacturing effort, fails to make a much better showing for this type. For even counting all the cars listed in the British market, only 18 per cent. are found to have 6-cylinder motors, while 65 per cent. are of the quadruple type, 12 per cent. double, and 3 per cent. single.

This is a catalogue census pure and simple, but as specifications drawn from the most improved cars existant at the close of 1907, must necessarily relate to 1908 cars almost entirely, judgment on the basis of sales is impossible. Even on that basis, however, the fairly built composite car should be of the 4-cylinder type. Conclusions of this sort are useless unless compiled with regard to average practice rather than with regard to what may be called "best engineering" at the time.

COMING EVENTS

January 14-18, Hartford, Conn.—Hartford Automobile Dealers' Association show in Foot Guard Armory Hall.

February 1-8, Providence, R. I—Show in Providence State armory.

February 10-15. Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association show in Central armory.

Yonkers, N. Y., affords a fair illustration of the inconsistency of which automobilists have a right to complain. Although previous wildcat races had resulted in several near-tragedies and though formal protest had been lodged with the mayor and the chief of police, those worthies were on the list to serve as officials of the dangerous and unauthorized midnight race of motorcyclists who tore through Yonkers at an unholy pace of 40 or 50 miles per hour, in the darkness of the New Year. Automobilists who have chanced to pass through the place in the safe hours of daylight at less than half that speed, have been pounced upon and haled to jail. It would serve a good purpose if such officials were called to account for such connivance at law breaking and such miserable inconsistency.

It is evident that we are now due for an epidemic of taxicab companies. The number of them that are forming is becoming formidable. It is safe to say, however, that of those who "take out their papers," the number that actually will operate cabs on the street will be insignificant. There are some honest, hopeful souls who appear to imagine that a taxicab service is analagous to the keeping of a livery stable.

THREE CARS TIED A SECOND TIME

Result of Philadelphia Endurance Run Decided by Technical Process—Trophy Awarded to Sheridan.

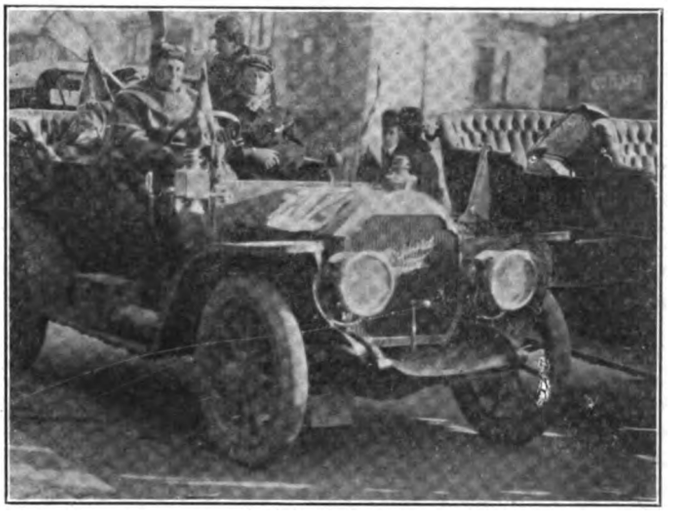
Hal. K. Sheridan of Philadelphia will hold the MacDonald and Campbell trophy for one year. The judges in the Quaker City Motor Club's two-days endurance run from Philadelphia to Allentown and return, Wednesday and Thursday, 1st and 2d insts., have ruled that he won the contest. As a result, not every one is happy.

When the run finished on Thursday three cars were found to have clean scores in the touring car class. These were Sheridan's White, Bert Maucher's Peerless, and Frank Yerger's Studebaker. Exercising its prerogative to make the three cars run the contest over in an effort to break the existing tie, the contest committee made the cars follow the same course on Saturday, 4th inst., as in the original contest, except that they were required to cover the 172.6 miles from Philadelphia and Allentown and return in one day instead of in two. The tie remained unbroken when the cars finished and then the technical committee got busy with the result that Sheridan was awarded the trophy, with Maucher second and Yerger third. The final findings of the technical committee have not been made public, but the demerits suffered by the two losing cars were of a minor nature, the Peerless having lost a hood catch and a small spring on the brake-band. John Trumbull, who drove a Packard, was the only car in the high powered runabout class to finish with a pecfect score, and the Maxwell won the light runabout trophy with 51 points against it.

As a result of the decision the Philadelphia motor colony has lost its usual placid quietude. It has caused one member, who was interested in the Peerless, to resign from the club, and challenges from the Studebaker representatives to Sheridan, the driver of the winnig White, have been flying thick and fast, while Sheridan has retorted that the Studebaker man may be sorry he challenged if the technical committee's report is made public. As chairman of the contest committee, E. C. Johnson has been placed in a position that he would rather not be in, as unfortunately he happens to be the Philadelphia representative of the White.

When the cars started on their return journey from Allentown Thursday morning, six touring cars and two runabouts had no marks against them so far as could be determined. Three of the former and one runabout lost marks before Philadelphia was sighted in the afternoon. Frozen roads and bad water breaks on the roads between Allentown and Kutztown, the first control, caused many cars to have demerits checked against them, but from Kutztown to Philadelphia the going was easy. There were no incidents worth recording, except that in Reading the police kept the streets clear for the contestants, in striking contrast to the arrests made in that city when the endurance run passed through it last year.

When Philadelphia was reached the real work of the officials began. The technical committee's function was to examine all the contesting cars and report to the contest committee any defects or breakages found upon those cars after the run was finished. The report was made to the latter committee and passed upon before the identity of the particular car under investigation was made known, so that the decisions were manifestly fair to all concerned in the matter.



The committee found that with the exception of two bolts missing from the right shock absorber on the Studebaker, that car had no points against it, and although Sheridan, driver of the White, prot sted, the committee had to allow Yerger a clean score as it previously had been decided that no penalizations should be imposed on accessories, such as tires, lamps, speedometer, shock absorbers, tops, clocks, odometers, and so forth. The committee assessed ten points against Maucher's Peerless, claiming they found the transmission loose, but the driver protested, and as the required fee accompanied it, the committee was obliged to consider the protest. Maucher claimed that all Peerless cars are made with transmissions slightly loose. After a thorough examination of five brand new cars, the transmissions of which were found to be the same as in Maucher's car, the ten demerits were cancelled and his clean score restored. John Trumbull's Packard was the only car that could produce a clean sheet in the high powered runabout division.

This gave three cars with perfect scores for the MacDonald and Campbell trophy for touring cars and as the committee could see no other way of disposing of the tie it ordered Sheridan, Maucher and Yerger to again cover the course, this time in one day, under otherwise the same conditions that governed the original run. The trio set out Saturday morning and kept within sight of each other all the way, finishing on exactly schedule time, one minute apart, in Philadelphia Saturday afternoon. As the tie still remained unbroken the technical committee made a critical examination of the three cars and reported to the contest committee, which decided in favor of Sheridan for first place, Maucher for second and Yerger for third.

The prize for light runabouts was awarded to the Maxwell Company's Maxwell, which had 51 points against it. W. H. Cram's Mitchell was second with a deduction of 62 points. These were the only two cars that finished, and unlike those in the other divisions, had only to check out in the morning and in at night. A prize also was awarded in the "go-as-you-please" division, which as its name implies, was

for those who wished to accompany the run, and not be bound by schedule or regulations. The winner was determined by a vote for the most popular driver and Daniel Webster, a Vanderbilt cup race driver, won by an overwhelming nuber of ballots.

After the run, there was quite a demand for brooms, which were carried aloft and which were supposed to represent a "clean sweep." There were so many brooms displayed, however, that the Philadelphia public may be pardoned if it was confused and unable to decide exactly who was "it."

Sheridan, who was entitled to carry the biggest broom, is the same driver who won the run-off for the Hower trophy in the last Glidden tour.

The appended table shows the scores of the cars that finished the run:

PROGRAM FOR FLORIDA SANDFEST

Seven Events on the Card, Including Contest for Dewar Trophy—List of the Prizes and Conditions.

That freak racing cars, designed for abnormal speeds at short distances only will be eliminated at the annual Ormond-Daytonna carnival, which is on the calendar for the week March 2d to 7th, is made plain in the entry blanks sent out this week by the Automobile Club of America, which is managing the meet, In order to qualify for the short races—the mile and kilometre record trials, the one mile race for the Dewar cup, and the two miles a minute event—the cars must have competed in one of the three long distance events, and must have covered at least 100 miles at an average rate of 60 miles per haur. As any car that can maintain a mile-a-minute speed for one hundred miles is surely not a freak, this condition doubtless will be a factor in swelling the entry lists.

According to the entry blanks but seven events have been carded, but if these are well contested there should be no complaint from spectators, provided of course, the meet is managed with any sort of system, something that has not prevailed at previous Florida carnivals. The exact time of starting each event will depend on the tide and condition of the beach, and all the races will be started from the club house at Daytonna, so far as is practicable. As has been told in the Motor World, loops will be built at each end of a sixteen mile stretch of sand, affording a 32 miles circuit for the long races.

Doubtless the most important event carded is the 160 miles race for stock chassis, and manufacturers entering cars in this event will have to prove that they have actually manufactured and delivered or have ready for delivery at least ten similar chassis in each and every respect, on or before February 15th. In this event the total piston area shall not exceed 103.87 square inches, which will admit the equivalent of a four cylinder engine having a bore of 5¾ inches. In all the other events cars will be limited in weight to 1,100 kilograms (2424 pounds). Following is the full program of the meet:

The Automobile Club of America Cup—288 miles (nine laps of 32 miles), standing start. Entrance fee, $200.

Invitation Race for gentlemen amateur drivers, for a Silver Cup—128 miles (four laps), standing start. Cars to be eligible must have been owned by the entrant prior to the time of the public announcement of the race. Entrance fee, $100.

Minneapolis International World Championship Trophy—100 miles, standing start. Present holder, S. F. Edge, London, England. The cup must be won twice to obtain permanent possession. Entrance fee, $50.

Stock Chassis—160 miles (5 laps). A "stock chassis" shall mean that the maker of the same shall have actually manufactured and delivered, or have ready for immediate delivery, at least ten similar chassis in each and every respect, on or before February 15th, 1908. The type of the body is left to the choice of the entrant, provided it has seats for at least two and carries at least two (driver and mechanic). Any American or foreign stock chassis is eligible, providing that its total piston area shall not exceed 103.87 square inches, which will admit the equivalent of a four cylinder engine having a bore of 5¾ inches. Silver Cups to contestants finishing first and second. Entrance fee $100.

One mile, flying start, for the Sir Thomas Dewar World's Championship Trophy. Present holder is Fred Marriott of Newton, Mass. Not more than four cars will run in a heat. A second round of heats will be run, if necessary. The winner of each heat (or second round of heats, as the case may be) and the fastest second car to compete in the final. The entrance fee for this event, as fixed by the deed of gift, is $50, which is deposited in a fund in the hands of trustees of the trophy for special road construction.

Two miles, flying start, for the two-mile-a-minute trophy, to be run in the form of time trials, winner to equal or exceed a speed of 120 miles an hour. Entry fee $50.

Record speed trials for mile and kilometer. Entrance fee $25.

Another Pasadena-Altadena Hill Climb.

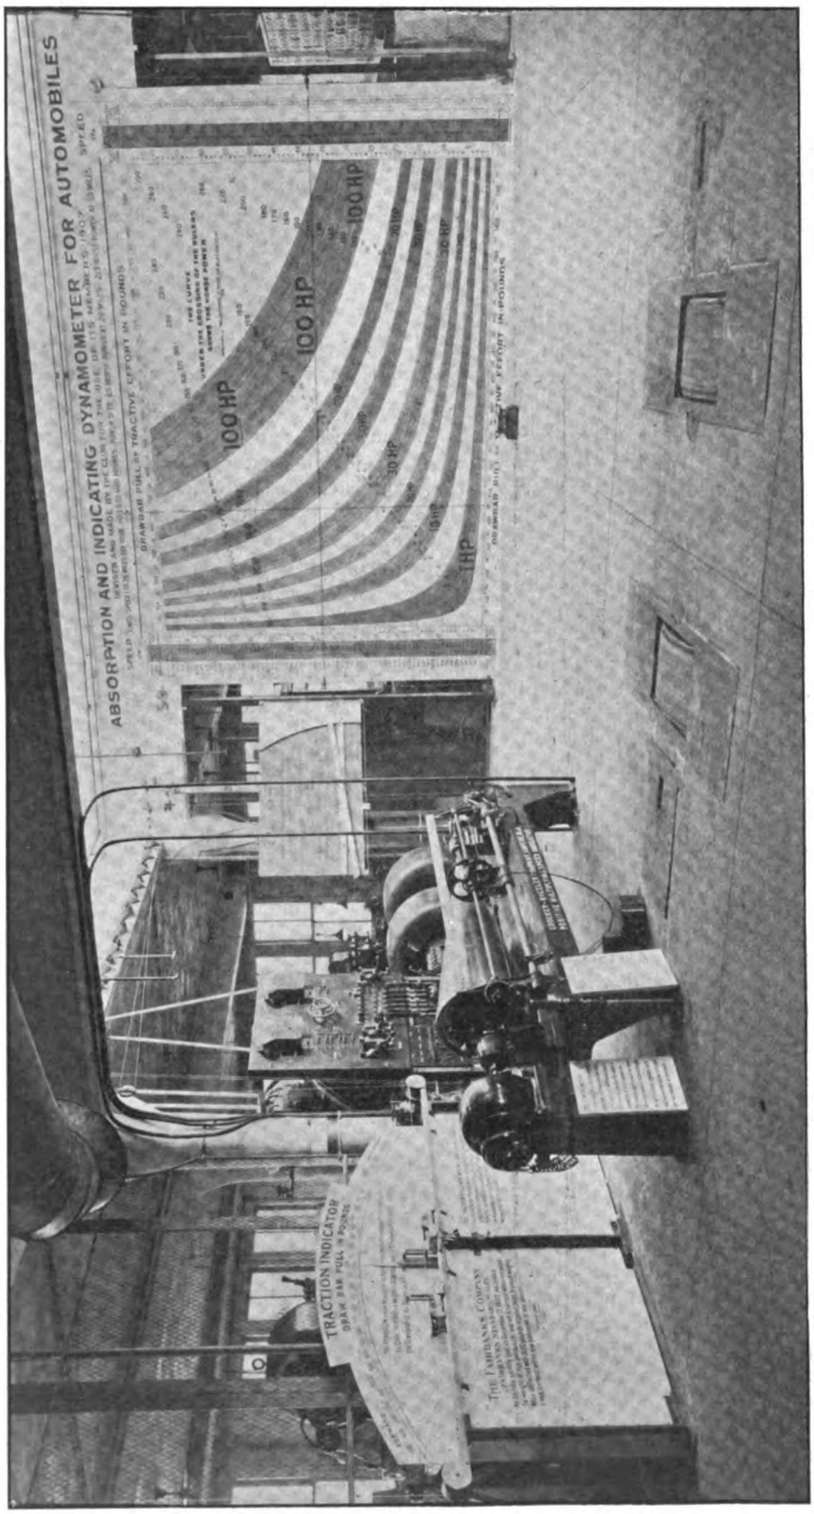
After much discussion the Southern California Automobile Dealers' Association finally has decided to repeat its annual Pasadena-Altadena hill climb. It is on the calendar for February 22d, and the program for decision is as follows: Runabouts, $1,000 and under, two passengers, weight per passenger, 130 pounds. Touring cars, $1,001 to $1,500, four passengers; weight per passenger, 130 pounds. Touring cars, $1,501 to $2,000, five passengers; weight per passenger, 130 pounds. Touring cars, $2,001 to $2,500, five passengers; weight per passenger, 145 pounds. Touring cars, $2,501 to $3,000, five passengers; weight per passenger, 165 pounds. Touring cars, $3,000 to $4,000, five passengers; weight per passenger, 175 pounds. Touring cars, $4,000 and over, seven passengers; weight per passenger, 145 pounds. Runabouts, $3,000 and under, two passengers; weight per passenger, 150 pounds. Runabouts, 3,000 and over, weight per passenger, 150 pounds. Special event for four cars with fastest time in previous events.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

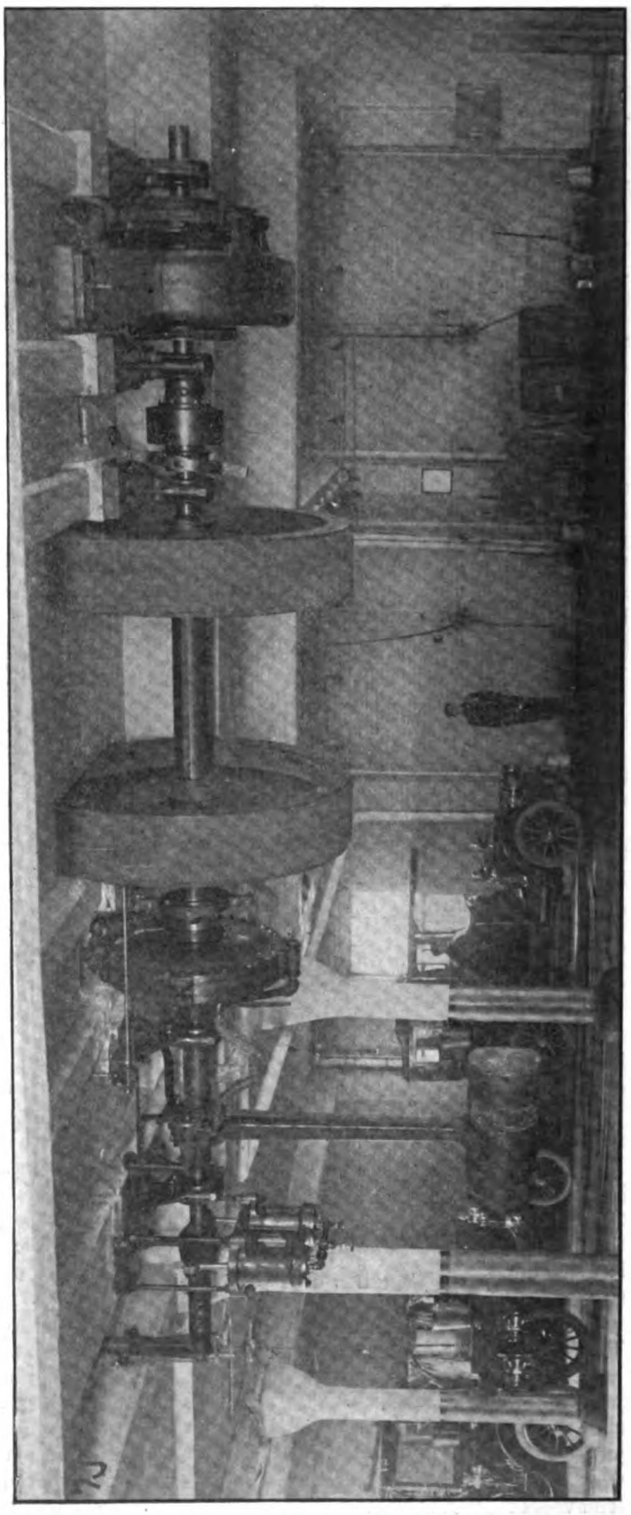
ROUTE FOR NEW YORK-PARIS RACE

The Itinerary Permits of Option at Several Points—Possible Failure Discounted in the Conditions.

Although the names and number of starters is shrouded in beautiful uncertainty, the Paris newspaper which is promoting the so-called New York to Paris automobile race, has announced the itinerary selected for the great contest in shipping motor cars as freight over circuitous and difficult routes. It is a little indefinite in spots, but in a general way indicates the path the carriers will have to take. As outlined it consists of "the crossing of the United States without any auxiliary power whatsoever, unless during the passage through the Rocky Mountains and the Sierras. Then from San Francisco to Seattle along the glacial coast of British Columbia as far as the entrance to Alaska by way of Valdez. Then by roads or frozen streams to Norton Sound, to Nome. Bering Strait may be crossed either on the ice or by steamer. In Asia the route may be either by land or by way of the ice along the shores of the Arctic Ocean, through 5,000 kilometres in Siberia, following the Lena River, passing through North Siberia to Irkutsk; thence to Paris by the route of the Trans-Siberian Railroad to Moscow, St. Petersburg, Berlin, and Aix-la-Chapelle."



The start is to be made between February 10 and 15 from Times Square, New York. In traversing North America the speed laws of the various localities will be respected, it is announced, so that the contest will not partake of the nature of a speed race. In anticipation of none of the contestants reaching Paris, the promoters, scenting probable failure, have "cast an anchor to windward" by providing that the cup which is offered shall go to the car which succeeds in getting farthest from New York.



Rioters Routed by Automobiles.

Whatever may or may not be done with automobiles in war they have had a satisfactory test in dealing with a riot, which is war in miniature. This was at Muncie, Ind., on Saturday, 4th inst. Muncie, in common with several other cities in the Hoosier State, has a street car strike in progress, and on the day mentioned it developed riotous features. The traction company was for having the militia called out, but the police and deputy sheriffs said that with the aid of automobiles tliey expected to be able to get along without troops.

They did. It was in outlying sections that the automobiles were brought into play. Six of the vehicles were loaded with special officers to patrol the outskirts of the city. Mobs that had gathered in Congerville and Macedonia were quickly dispersed.

A. C. A. Sets Up Imposing Plant to Test Car Capacities

INDICATORS SHOWING COMPLETE RESULTS OF TESTS

After more than three years of patient development the Automobile Club of America has produced what with apparent right is claimed to be beyond question the most complete and efficient car dynamometer in existence. The plant, representing a cash outlay of something like $10,000, is the invention of Dr. Schuyler Skaats Wheeler, first vice-president of the club and an engineer of the highest standing, and has been built under his supervision as chairman of the building committee. Although announced prospectively in May, 1905, when the plans for the new club house were first made public, the dynamometer has only just been completed, its first official trials being consummated Tuesday of this week in the presence of a number of guests of the club, newspaper representatives and others, at its palatial quarters.

The opportunities for inspecting the device offered at that time were most excellent, a full set of working drawings of the dynamometer being laid open for inspection in the grill room, while the apparatus itself, which is placed in a wire enclosure of the repair shop on the top floor of the club house, on West Fifty-fourth street, New York, though extremely intricate, was made thoroughly understandable

CAR UNDERGOING A TEST

by the legends attached to the various parts as well as by the oral demonstration given in connection with the several tests which were carried on. Dr. Wheeler himself conducted the trials after explaining the principal points of the system, while former Presidents Dave Hennen Morris, A. R. Shattuck, and Gen. George Moore Smith, of the building committee also were present.

Some idea of the completeness of the dynamometer may be gained from the statement that it is capable of measuring and recording directly the speed of the car under test, the draw bar pull or tractive effort, the horsepower delivered at the tires, the grade climbing ability and the power of the brakes. But its most significant merit is that it is capable of integrating these values by mechanical means, thus affording the exact results at every instant of the test and without the necessity of any calculation whatever on the part of the test crew. In this respect it is probably the most complete arrangement of the dynamometer class ever devised.

In principle it comprises merely a couple of tread rollers on which the wheels of the car are placed and which are mounted in such a way that the machine may be driven

Digitized by Google

into position over them under its own power, the tops of the rollers projecting only a very little above the level of the test floor. When anchored against both forward and backward motion, the complete tests as above outlined may be performed at once. Up to this point, the system may be said to resemble that employed in the dynamometers used both in automobile and locomotive testing up to this time. The particular novelty which it possesses is confined to the fact that the usual draw bar mechanism for measuring the actual pull of the vehicle, is done away with the anchors at both ends being fixed, and the actual pull being calculated from the torque of the dynamometer shaft itself, thus simplifying the mechanism without, in this case complicating the result in any way.

The shaft carrying the two dynamometer

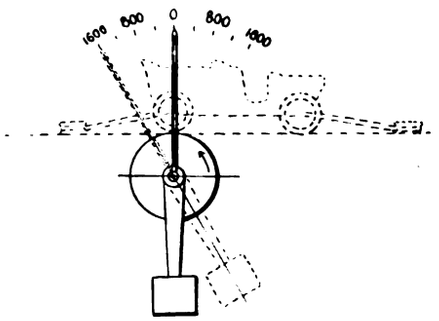

Fig. 1

rollers is mounted in brackets suspended from the ceiling of the floor below the test room and is connected by means of friction clutches with either of two other shafts in the same line, one of which is mounted at either end. That upon the right, looking toward the front of the car under test, carries an electric motor which is used in testing the braking power of the car, while upon the other side is mounted the dynamometer, proper which consists of a special form of hydraulic brake, the stator of which is connected with a heavy pendulum weight which is displaced through a small angle as the rollers turn, as in Fig. 1. The motion of this pendulum is transmitted to an arm above, which moves across a scale showing the draw bar pull in pound readings, the deflection being in either direction according to whether the car is being driven forward or backward. By means of a very delicate electrical contrivance, the motion of this pendulum indicator is made to control the motion of a small electric motor which through a cable drive causes a vertical tape to move across the horsepower chart at the front of the room. The position of this tape with regard to the scales over which it passes thus records the exact draw bar pull at any and every instant during the progress of the test.

For determining the speed, which is the only other variable element entering into the calculation, a special device is used which, though somewhat roundabout is nevertheless extremely accurate. Two elements are utilized in calculating the speed whereby the errors possible with any fixed scale are eliminated. In the first place a long steel cone of exact taper is mounted accurately and driven at stated speed by a small electric motor under the control of a sensitive hydraulic governor, as in Fig. 2. To enable the speed of the roller to be checked with absolute certainty a bell is made to ring at the end of every hundred revolutions, so that at the normal speed of 200 r. p. m. the bell rings every half minute. This arrangement as described, it is to be understood, serves mere-

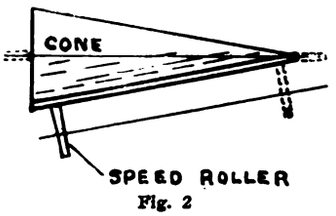

Fig. 2

ly the purpose of establishing a standard of time.

The second element of the timing device consists of a second shaft arranged parallel to the surface of the cone and driven from the dynamometer at a speed which is always proportional to that of the rollers. Mounted on the shaft is a contact wheel touching the cone, which may be slid back and forth along a spline on the shaft. By means of a small electric motor its position may be altered by moving it along the cone in either direction. The control of the motor is vested in a relatively simple system mounted in the wheel or speed roller itself whereby if the speed of the roller is not the same as that of the cone at the point where it makes contact the roller is moved along the cone until it comes to a point where the surface speed of the cone and the surface speed of the roller are the same. This axial movement is, of course, produced by the small pilot motor, current to which is controlled by the contacts on the speed roller itself.

In this way the speed roller automatically seeks out a position on the cone which is traveling at the same rate of linear speed. But the angular speed of the cone being an absolute constant, the distance of the roller from its apex forms an accurate measure of the rate of speed of the dynamometer, or, in other words, of the car under test. The movement of the speed roller along its shaft being communicated to the chart by means of a second system of cables, causes a horizontal tape to travel up or downward, thus indicating the speed on the proper scale.

In this way the two indicating systems automatically seek out on the chart the rates of draw bar pull and speed corresponding to the power being developed at the wheels of the car at any instant. The chart being drawn in the shape of a horsepower diagram with speed and drag as variables, it is evident that the intersection of the vertical and horizontal tapes must indicate the horsepower curve corresponding to the power, as in Fig. 3.

A supplementary device, which is fully up to the measure of the others in the way of theory, is the grade meter which is arranged to show directly in angle and in percentage, the grade which the car could climb under any condition recorded on the chart, neglecting wind and road resistance, and assuming that the driving wheels do not slip. The indicator is based on the principle that the sine of the grade angle is equal to the tractive effort divided by the weight of the car. The grade meter itself is nothing more nor less than a weighing balance in which the drawbar pull is measured by the position of a scale beam weighted by a pein which is placed in a position on the beam to correspond with the weight of the car. The angle of the beam

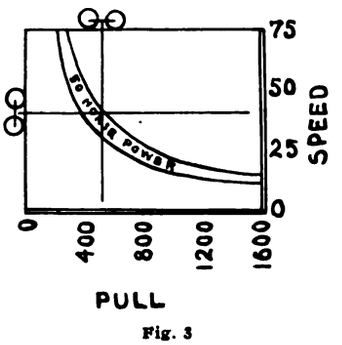

Fig. 3

causes the pointer on its extremity to record the angle of the theoretical hill.

By connecting the electric motor, which is on the other end of the dynamometer shaft, the transmission friction as well as the braking power of the car may be tested. A special motor generator is used to deliver current of any desired strength to the motor, which thus drives the wheels of the car under test. The switchboard readings then give the power being used in driving the mechanism of the car, an ingenius method of labeling the switches indicating at once whether the car is absorbing power or is giving it up to the electrical system according to whether positive or negative readings are given by the instruments. By applying the brakes under these conditions, the amount of retardation possible may be observed, while by reversing the direction of motion of the dynamometer, the braking power may be tested for backward as well as forward motion of the car.

The first car to be officially tested on the new plant was a 25 horsepower Pope-Hartford belonging to the club. The showing made was most creditable to the machine, the maximum power developed on third speed, being equivalent to the rated horsepower, which, as the power shown on the chart is the output delivered at the rear wheels and not the nominal figure ordinarily catalogued, proved that figure to be a conservative one. By way of illustrating the range of the testing plant, the full observations for each of the three forward

Digitized by Google

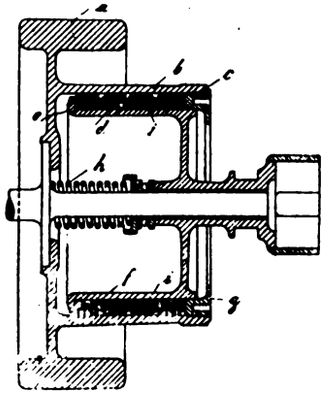
speeds are appended, as read directly from the board.

	First speed.	Second speed.	Third speed.
Speed in miles per hour	15	25	36
Drawbar pull in lbs.	510	340	270
Horsepower delivered at rims of driving wheels.....	20	22	25
Equivalent grade in per cent.	20	14	11

Subsequently W. K. Vanderbilt Jr.'s 90 horsepower Mercedes racer of Ormond fame was put on the rollers and raced madly on the low gear, the engine proving so powerful that with the water pressure then available from the storage tank on the roof it was impossible to brake it down to its full power. It was announced parenthetically at this time, that a new pump yet remained to be installed before the plant would be quite complete. On the high gear, the same car developed 75 miles an hour, while delivering a little short of 50 horsepower. A Westinghouse car was tested later, and did well on the first and second speeds, but failed on the high gear owing to overheating because of the inadequate cooling of the small fan placed in front of the radiator.

Another test, introduced by way of illustrating the utility of the brake, was that of a speedometer, which was tried by running the front wheels of the car on the rollers while the latter were driven electrically, the readings of the instrument being checked against those of the speed indicator on the great chart.

The arrangements of the plant are complete in every way save for a few minor details which remain to be smoothed over. And from the huge swinging exhaust pipe, through which an exhaust fan carries off the motor waste, to the certificate of the exact mass of the pendulum by the Fairbanks Morse Co., evidence is given of a tremendous outlay of pains and skill to make the system one of unexcelled exactitude and creditability—an effort in which has been most successfully rewarded.



Increasing Use of the Clutch Brake.

One of the "little things" in the constructional line which go such a long way toward improving the general performance of the machine without at the same time altering its principal features in the least, is the adoption of the clutch brake. This is growing more common every year and in the course of time will likely become almost if not quite universal. No matter how well designated and made, there are times in the life of every clutch when it will refuse to release as promptly as it should, or when, for some perhaps inexplicable reason, the clutch shaft continues to spin after the clutch has been released and at such a rate as to prevent gear changing without braking the gears by burring together the ends of the teeth. The use of the clutch brake obviates this entirely making it possible to shift the gears "sweetly" on all occasions.

NOVEL SELF CONTAINED CLUTCH

Combining Principles of Both Ring and Cone Clutches It is a New Departure —Details of Its Construction.

An exceedingly novel development of the multiple ring clutch idea embodying at the same time the advantages of the wedging action possessed by the cone type, is the recent invention of August Horch of the Saxony firm producing a car of the same name. Briefly, it comprises a large number of split rings of triangular section which are contained in the annular cavity formed by two telescoping drums, one of which is

formed integral with the fly wheel and the other as the secondary or driven member of the group. Forcing the two drums toward one another axially, serves to crowd the rings together, thereby spreading them and forcing them outward and inward against the drum surfaces, which thus are locked together.

The general scheme will be seen from the illustration here shown, which is a plain half-section. The sleeve or drum, b, is mounted on the fly wheel, a, and has an internal screw thread, c, at one end. The drum, d, fixed to turn uniformly with the driven shaft and carrying the flange, e, is inserted within the first mentioned drum leaving a space between them in which the rings, f, are placed. The rings being split and properly abutted, any end pressure brought to bear upon them must serve to expand them both outwardly and inwardly against the two confining surfaces. They are retained in position by means of the junk ring, g, which is screwed into the drum, b.

The clutch is of the self-contained pattern in so far as actuation is concerned. That is to say, the helical spring, h, serves to press the drum, d, away from the flywheel, but compresses the rings, owing to the presence of the permanent ring, g. The method of actuation may be the same as with the ordinary type of cone clutch, the usual forked yoke being connected with the pedal in the usual manner. By proportioning the angles of the sides of the rings properly, it is evident that a very gradual engagement may be secured, while at the same time, the clutch will be unlocked by the very action of the driving torque so soon as the end pressure is released from the group. The arrangement permits the use of a large amount of working surface in the clutch and admits of good lubrication by splash, since the drums may be made oil tight, and there is little in the way of mechanical complication, despite the fact that a very great number of rings may be employed upon occasion.

Knocking Traced to Unusual Cause.

A most unusual source of knocking in the motor is reported by a Western dealer handling a well known line of popular priced cars which are fitted with horizontal opposed motors. Several different machines had developed the same mysterious sound without apparent provocation and not until one of them was dismantled and carefully inspected did it appear that the noise was caused by the slapping of the piston against the cylinder wall at the rear end, the bore proving to be larger at that point than at the crank end. At first it was thought that the trouble was due to some inherent difficulty in the cylinders themselves. Subsequent investigation, however, revealed the fact that in grinding in the valves, the mechanics were not sufficiently careful to prevent the surplus emery from working into the cylinder. The effect of this carelessness had been to grind off a very appreciable amount of surface from the under side of the bore.

French Car with Belt Transmission.

Ordinarily the use of the belt transmission in motor car propulsion is considered too antiquated and inefficient for serious regard. It is a matter of no little surprise, therefore, to find that a commercial vehicle is even now being built in France in which this feature is employed regularly. The machine in question is the Pantz, which is made in 1½ and 3½ ton sizes, with motors of 9-11 and 12-15 horsepower, respectively. In these vehicles, the motors are mounted horizontally under the footboards, while the change gear box is located in the rear, driving the wheels through very short side chains. The connection between the motor and gearset is by means of a crossed belt which thus is made to run nearly the entire length of the chassis. The maker of the Pantz is among the oldest builders of commercial vehicles in France, and his product is said to have a good record of performance.

Careful drivers generally make it a practice to declutch at the instant of crossing a "hump" in the road, to relieve the strain upon the car by checking the driving force and allowing its momentum to overcome the extra resistance which the obstruction presents. When this is done skilfully and the clutch again engaged before the machine has fully recovered, it is found that the shock experienced by the passengers is materially reduced.

ABOUT MANUFACTURERS' AGENTS

Varied Phases of Their Business Character —Some Indeterminate Factors in the Value of Services.

For a business requiring no other capital than enough to pay office rent and railroad fare, and partaking of the nature of a free lance disposal of personal services, that particular line of endeavor known as being a manufacturers' agent is perhaps unique in the automobile trade. Not but what the manufacturers' agent is not a familiar figure in other lines of business as well, because he has of late years become a well recognized institution, but in his activity in the merchandising of automobile parts and accessories he presents some interesting phases.

No discounts or commissions are yielded more grudgingly than those to the manufacturers' agent because of the difficulty it creates with the jobber unless it be known positively that the agent is on a salary basis and is not enjoying an under discount. It is one of the first principles of a jobber's buying to insist on the lowest price that is made to any one and the fact that a manufacturers' agent can sell on commission is taken as prima facie evidence that the price could be lowered.

On the other hand, the manufacturer is reluctant to enter upon a salary arrangement with the agent since he has no control over his time and can by no means be certain that the agent's efforts will not be devoted more ardently to those of his lines which give a profit according to the amount sold.

Yet the manufacturer who comes into the automobile parts or accessory field comparatively unacquainted with the personnel of the trade and the intricacies of its policies and arrangements, is peculiarly susceptible to the arguments of the manufacturers' agent as to the importance of the latter's services. Needless to say such representations as to the ability of the agent to create a market for the manufacturer's goods and place them favorably in the trade are often greatly overstated, while again some of the most successful and satisfactory agents are strangely diffident in their views as to what they could do for a prospective client.

When the agent who is soliciting an account evinces any overwhelming degree of enthusiasm and paints glorious pictures of the immense volume of sales he is sure of making if the manufacturer will entrust the large end of the selling to his tender care, it is well for the manufacturer to give a show of insistance on a commission arrangement as the only one he would consider. If the agent jumps at the chance the manufacturer can reconsider or name an impossibly small commission, or discount, if it be his real intention to avoid giving his agent a commission. The commission proposition, however, will serve to test in some degree the genuineness of the agent's mental visions of big sales.

Not a few manufacturers who have angaged the services of so-called manufacturers' agents at high salary figures have found that they picked the wrong man, and that the agent's time was largely spent in soliciting still other manufacturers for accounts on a salary basis, so that instead of his being active in the sale of goods he was simply swelling the multiplicity of his salary sources.

"I don't believe he did more than an hour's pushing of our goods during the whole season," said one manufacturer recently, in describing his troubles with an agent, who had talked him into a salary contract with the persuasion that it was the road to fortune. "If that fellow had used the same power and eloquence in pushing our line that he did in talking about himself, in a year we would have been the biggest people in the business."

Even the commission system does not give the manufacturer any guarantee of hard work on the part of the agent. Some of the less scrupulous of those posing as manufacturers' agents have in the past been known to enter upon as many commission arrangements as possible, for as wide a range of articles as they could get. Having secured contracts by which they would get a "rake-off" on all sales in certain territories, they have calmly waited in their offices for the commissions, knowing that out of the large number of things covered by their contracts a certain proportion were bound to prove successful and enjoy a big sale, without effort on their part. Nor would they hesitate at the end of the season to "point with pride" to the conspicuous successes on their list despite the fact that their contributions to such results were nil.

But the unfortunate experiences various firms have encountered in dealing with agents who do not attempt to "deliver the goods" are offset by the valuable and satisfactory service which many of them have had from manufacturers' agents who have taken a broad view of their field and responsibilities and who have also been equipped with the personal acquaintance, the knowledge of the trade and the selling ability that would enable them to perform what was expected of them. Many a manufacturer has felt the benefit of relying upon the experience and judgment of his agent in making his introduction into the market and in determining his policies in relation to the trade. With a list of several of the big firms in non-competing lines, an agent can give to each one the advantages of the sum of his knowledge gained from doing business for them all, having a wider view than the men devoted to one particular line.

To measure exactly either the direct or the indirect results of the agent's work where he has a hand in the promotion of the business naturally is a most difficult matter except in specific cases where certain definite tasks are set. If a manufacturer having failed to get his goods handled on a satisfactory basis by this or that particular house, entrusts the negotiations to the agent and the latter succeeds in straightening matters out, it is easy to see the nature and success of his work. Similarly, if in seeking to close an equipment contract with an automobile manufacturer the agent is able to swing the deal, there is again definite evidence of his value. But in the general results of his ordinary work it is extremely difficult to judge, especially where he works among the jobbers.

It is safe to say that the agent who takes the mysterious attitude and seeks to convey the impression to the manufacturer that he can exercise a mysterious hocus-pocus or hypnotism on the trade, which his client must not attempt to inquire into or understand, is bluffing to some extent. If the manufacturer needs trade advice and the assistance of a selling agent, his safest plan is to select the man who can turn to such clients as he has and has had, for reference, and whose proposals for pushing the manufacturer's goods have in them the element of conservatism and sound sense, with the compensation in some manner proportioned and contingent upon the degree of subsequent success.

American Chassis Popular in Sweden.

Stockholm and in fact Sweden are attractive fields just now for the cultivation of American manufacturers of automobiles, says the American Exporter. A certain prestige may have been gained by the fact that the motor cabs recently introduced on Stockholm streets came from America, at least so far as the chassis is concerned—bodies were built locally. There are about forty-five motor cabs now at work, the greater part of them of the above description, and it is said that the number is soon to be increased. They are giving satisfaction, though the bodies that were made for them are both ugly and awkward. Two or three other makes of American automobiles are on this market. Complaint is made that sales are slow, but then the whole question of motor cars is very young yet in Sweden. It is estimated that there are not more than 500 motor cars in Stockholm, plus about 300 in all the rest of Sweden. Swedish manufacturers in this line are doing little as yet beyond the production of a few freight trucks that are quite popular in Stockholm, and reported to be satisfactory in service.

Police Chief Asks for Automobiles.

Automobile patrol wagons will be added to the equipment of the police department of Cleveland, O., if Chief Kohler can have his way. Among a number of recommendations made in his annual report is one for several of the now widely approved vehicles.

PROBLEM OF WHEEL DIAMETERS

Their Adaptation to Service as Governed by Resistance, Strength and Vehicle Mounting—Curious Extremes.

A subject for constantly recurring discussion and one which is bound to come in for more serious attention in the future than it has even in the past, is that of wheel diameter as related to questions of tractive resistance, motive power, and strength. At the present time and in American motor vehicle practice, wheel diameters vary from 28 to 54 inches—the first applying to light vehicles of the runabout type and the last to road tractors of a single make. More generally, the average size of the road wheels of touring cars has been increased from 34 to 36 inches for machines of high power and weight within a couple of years, and the change has proved beneficial. In the high wheeled buggy, is found a most important exception which is being seized upon by numerous advocates of the high wheel principle as an illustration of its advantages.

What then are the advantages of the high wheel as compared with the low, and what factors may be considered as limiting wheel sizes, all ordinary considerations being taken into account? The question has been thrashed out over and over again in other lines, from the case of the horse-drawn vehicle itself, down to the locomotive, which also partakes in some measure of the elements which the motor car designer must take into account. At present, the trend of automobile design is backward, that is to say toward the high wheels which were used on the earlier types of pleasure car. This backward swing of the pendulum is to good purpose, however, and answers directly the demand for better resiliency and longer tire life, quite as much as any inherent advantage accruing from the use of the high wheel. As the use of smaller wheels followed the adoption of the pneumatic, and was in obedience to the demands of economy, moreover, it is evident that tires have been the moving cause both in getting away from, and again approaching the high wheel. The question of wheel size, then, appears to have been but little considered thus far as a problem by itself.

Considered mechanically, that is, with regard to its smoothness of action and otherwise as affecting the vehicle merely as a carriage, there can be no doubt of the advantage of the high wheel. The greater the wheel radius, the nearer the approach of the circumference to a straight line, and so the less its affection by ruts and other depressions or obstacles in the road. To put it another way, the smaller the obstacle the less the power required to pull the wheel over it. So, the greater the size of the wheel, the less the power required to pull it over an obstacle of given size. The relative conditions are exactly the same. Hence, the large wheel is adapted to run more uniformly over a given surface than the small one, and, other things being equal, is superior to it.

At the same time, the greater the diameter of the wheel, the higher must be its axle from the ground, and while up to a certain point, this creates no disadvantage, the raising of the centre of gravity thus brought about must, in time, become a menace to stability. With the light motor buggy, and with the very heavy tractor, one of which carries but a small load, while the other carries its load at only a snail pace, even a very high center of gravity is permissible. Where higher speed and load factors are considered, however, it is not, at least with the present standards of wheel gauge, and so with the increase of wheel sizes beyond the present maximum standard of 36 inches, it must be necessary to adopt new methods of suspension in order to lower the body. This may be done either by cranking the axles liberally, and doing away with the live rear axle construction in present use, or else by adopting some such method of under suspending the frame as was suggested recently in these columns.

In the matter of strength, of course the high wheel suffers by comparison, yet not so much as would at first appear to be the case, owing to the fact that considerably more dish is possible without resorting to excessive cambre with the high wheel than with the low. In this way, the high wheel may be made of relatively greater strength in regard to transverse strains than the low and without distorsion. In the matter of resistance to dead load and torsional strains, however, it must be weaker, or, what is the same thing, for the same degree of strength it must be made proportionately heavier.

Considering the question of wheel sizes as applied to the driving or power side of the equation, it is evident that in the first place with two vehicles otherwise alike, but having wheels of different sizes, the power required to drive them must be about the same, that is solely with regard to the mechanism. The increased inertia of the larger wheels may have a slight effect, and the fact that for the same vehicle speed the larger wheel must turn more slowly than the smaller, is of tremendous importance. It means in a word, that the gearing ratio must be much greater in direct proportion to the increase in wheel diameter which, unless it be possible to develop high and uniform motor torque at very low crank shaft speeds, means the continuance of gear reductions and the elimination of the hopeful prospect of absolute direct drives in the event of a general adoption of the high wheel.

Coming to the more important question of the actual differences in power absorbed by large and small wheels, the smoothness of action of the high wheel mentioned above, implies correctly, a reduction in rolling friction which, according to the time-honored theories of General Morin, is held to be independent of tire width within nominal limits. The draw bar pull must decrease slightly as the wheel size increases then, regarding only the element of rolling friction. The factor of windage, however, which is of very great importance at high speeds, must be greatly affected by the raising of the vehicle from the ground, but may be compensated for to some extent by the development of low suspensions.

The cost of the high wheel system as compared with the low must be greater at present because of the necessity of developing new methods of springing, new designs in other respects, and also to a very slight extent, because of the greater amount of material used. Ultimately, however, it may be brought down to a par with the cost of the type in present use, should it prove desirable. Roughly speaking, the cost factor is the last to be considered in this connection, since tire life increases with the increase in wheel size, and lower maintenance compensates for increased first cost, judging on the tire basis alone.

The entire question of the determination of the proper wheel diameter then appears to hinge about the method of chassis mounting. The present high wheel developments in the two extremes of very light and very heavy vehicle service, are seen to be rational within their present limits. But whether they prove to be forerunners of a high wheel era of universal adoption, must depend very largely upon fashion in design. It would hardly seem that the gain brought about by the use of very large wheels, say of more than 38 inches diameter, would be sufficient to warrant the complete overthrow of present methods of suspension and axle construction. Certainly, the advantage of the large wheel is not sufficient in itself to warrant the adoption of the solid tire under present conditions of suspension, and so the matter largely reduces itself into a resolution of the suspension problem into its lowest terms. Pending that, all developments toward very large wheels must be viewed in the light of experiment, as applied to vehicles of moderate load capacity and high speed attainments.

Bearings with 30,000 Miles Record.

Since performance is much more convincing than promise, the Wm. Cramp & Sons Ship & Engine Building Co., of Philadelphia, is issuing souvenir postal photographs of a set of Parsons' white brass bearings which have had 30,000 miles running in a Packard car. The picture makes it evident that the bearings were in perfect shape in spite of so great a mileage, further testimony to the same effect residing in the fact that after having been "taken" by the camera they were replaced in the car for continued service without it even being thought necessary or desirable to scrape them.

CALIFORNIA WANTS FIRE FIGHTERS

Seven Cities Arranging to Purchase Automobile Apparatus—How Motors are Started Without Cranking.

Seven cities of southern California are ready to begin negotiations for the purchase of automobile fire engines, now that the two Rambler cars, specially built and equipped with fire-fighting apparatus by Thomas B. Jeffery & Co., for the city of Long Beach, have proven so efficient.

Long Beach was the first city on the coast to order motor fire engines. The cars were designed at the Rambler factory in Kenosha, Wis. They have 40 horsepower motors, a speed of 30 miles an hour is possible, and they will carry 800 feet of 2-inch jacketed hose, a 35-gallon copper chemical tank and 200 feet of 2-inch chemical hose. Space is provided for buckets, hooks, several short ladders, axes and four men.

In competitive test between a Rambler car and the old horse-drawn apparatus, made before the order was placed, a short run of 3880 feet was arranged. Every one, except the Rambler man, put his money on the horses. The auto was to start with a dead engine. The Rambler won, making the distance in just two minutes flat. Immediately it was decided to replace all horse-drawn vehicles with automobiles.

Since the cars were installed the Rambler agent has invented a tilting incline platform on which the car stands level when housed. At the sound of the alarm, the driver springs to the seat of the car and drops a hook which releases the chain securing the platform. The platform tips, the car glides down, the engine starts itself and the race to the fire begins without the loss of a second's time.

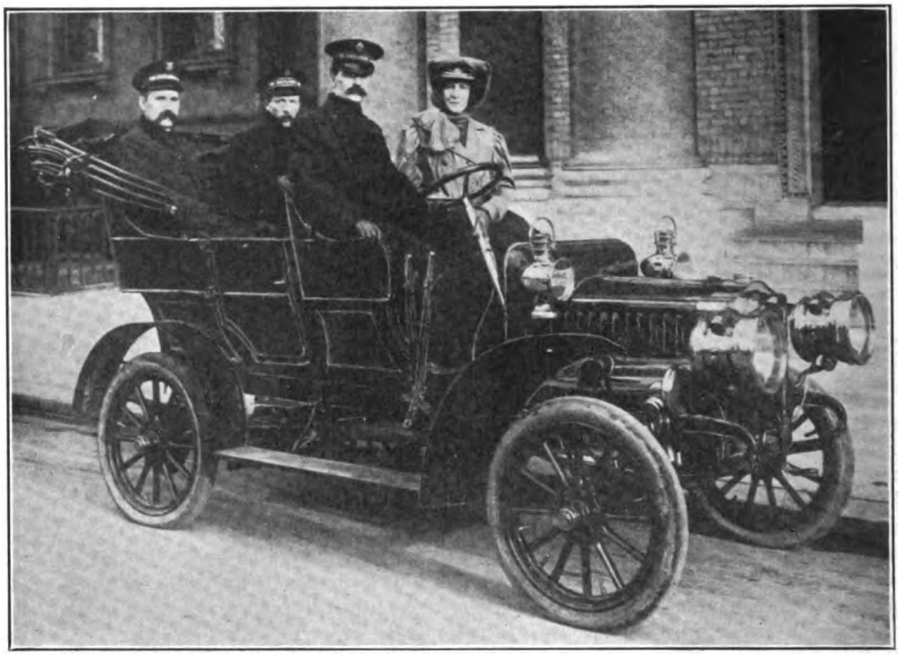
Motorphobic Magistrate Under Arrest.

For the first time in many months automobilists on Monday of this week drove through Magnolia, N. J., without fear of arrest for exceeding the prescribed speed limits as ordained by the State motor vehicle act. Farmers and residents driving by smiled as they drew their teams to one side to let the motorists pass for they realized that they were enjoying a pleasure that hal long been denied them. For C. Folk Klein, Justice of the Peace at Magnolia, and long a terror of automobilists who use the White Horse pike, was in the Camden county jail, arrested on a writ of the circuit court for failure to satisfy a judgment issued against him.

Klein first came into the public prints when he arrested and fined James P. McNicholl, a Philadelphia contractor and politician, for speeding, and was the justice upon whom the contractor perpetrated the joke of bringing down to Magnolia five cars of one make and challenging the "Squire" to pick out the one in which the violation of the law had been made. It is said that that was the only time that Justice Klein ever reversed himself, for he returned the fine of $13.75 which he had levied.

Residents of Magnolia say that Klein had taped off a half mile stretch of road in front of his office over which he timed automobiles that drove past. He was helped in his work by one "Thad" Miller, who held up the cars when Justice Klein waved his flag. Sundays were always harvest days for the Magnolia justice and there was always a waiting line in front of his legal parlors. Klein got himself thoroughly disliked some time ago by advocating that the village of Magnolia hang steel gates across the highways, so they could be let down in front of any automobile that he considered violating the speed law.

This historical resume, however, has nothing to do with the case in point, which is that until the justice is released from jail, automobilists can drive by his place in Magnolia without fear of being haled before him.



Lee Heads Bay State Association.

Elliott C. Lee, formerly president of the American Automobile Association, was on Monday elected president of the Bay State Automobile Association, to succeed Louis R. Spear, who has held the position for three years, since the association was organized; Mr. Spear declined re-election on account of business. Harlan W. Whipple was re-elected vice-president, as was Harry Knight, treasurer, and James Fortesque, secretary. The new board of directors will be composed of George McNear, A. P. Underhill, J. C. Kerrison, Dr. Julian Hovestadt and J. W. Maguire.

AUTOMOBILE FOR MISSION WORK

It Was a Providential Gift to Commander Evangeline Booth—Devoted to Salvation Army Service.

No slum or hovel is now too humble to have visitors call in an automobile since Miss Evangeline Booth, the American commander of the Salvation Army, was presetned with a Maxwel car. The machine goes anywhere that Miss Booth's duties direct, and needless to say it is busy most of the time. As shown in the illustration, she not only uses it herself but employs it to convey members of her staff, as well. The manner in which Miss Booth acquired the car bears testimony to the well wishing of her friends. It was awarded to her as the result of a puzzle contest conducted by a New York newspaper. While the Salvation Army leader herself was not a contestant, a great many of those who competed specified that if they won, the car should go to her rather than to themselves. The winner proved to be one of this number and accordingly the machine was turned over to Miss Booth with a felicitous presentation.

COMMANDER BOOTH AND HER STAFF

Total New York Registration in 1907.

In his first annual report to Governor Hughes, Secretary of State Whalen reports that in the twelve months ending December 31st, 13,980 automobile owners registered in compliance with the laws of New York, an increase of 2,331, and that 9,386 chauffeurs were granted licenses, an increase of 2,051. The fees received through the motor vehicle department amounted to $48,305, an increase of $10,810 over 1906.

MAYOR PLANS BETTER REGULATION

He Recommends Changes in New York City Automobile Ordinances—Some Evils He Would Banish.

In his annual message to New York City's Board of Aldermen, sent to it on Monday of this week, Mayor McClellan pays considerable attention to automobiles. The Mayor's suggestions regarding the regulation of automobiles used on city streets are designed to correct present abuses and appear to be sensible and clearly stated. What New York has needed for some time is an ordinance regulating the charges on automobiles used for public hire, and the adoption of one by the Aldermen is one of the suggestions of the Mayor. He also recommends that the ordinance apply specifically to the so-called sight-seeing coaches and provide for their licensing, the same as applies to other vehicles. At the present time this class of vehicles does not pay any fee to the city.

The Mayor aims to prevent the use of siren horns on any cars used on the city streets except those employed by the Fire Department, as the siren horn has been adopted as the particular signal of the approach of apparatus and officials of the department and the indiscriminate use on other vehicles, the Mayor thinks, is apt to lead to confusion and possibly accidents. He has prepared an ordinance to regulate this, which will be presented to the Board of Aldermen.

Among the other evils that the Mayor desires to have corrected is the cutting out of mufflers on cars on the built up streets of the city; unnecessary smoke from exhausts, and the use of dazzling acetylene headlights within the city limits, the last named three suggestions being the most important.

The full text of that part of the Mayor's message relative to the regulation of automobiles, follows:

"There is no general ordinance in existence at the present time which specifically applies to the licensing of public automobiles. Under an order of the Supreme Court the Bureau of Licenses is now issuing licenses to such vehicles under the general ordinance relating to public hacks and cabs. This ordinance, however, was never intended in my opinion to apply to automobiles and fails to regulate their charges in proper fashion. I recommend, therefore, the adoption of an ordinance which will apply directly to these vehicles. At the same time I believe that some provision should be made for licensing all sight-seeing automobiles, which at present pay no fee whatsoever to the city.

"In this connection I also desire to call your attention to the necessity of preventing the use of sirens upon all automobiles other than those of the Fire Department within the city limits. The siren has been adopted as the particular signal of the approach of the apparatus and officials of the Fire Department, and its indiscriminate use by others results in confusion of traffic, which necessarily detracts from the value of such signal to the Fire Department. I have caused such an ordinance to be prepared for introduction in your board, and trust that it will receive your favorable consideration.

"I think it also most important that the following regulations should be adopted in regard to the use of all automobiles, both public and private, within the city:

"First—That all automobiles should be equipped with adequate mufflers, which never should be cut out within the limits of the built up portions of the city.

"Second—That, except for the first ten seconds after starting the engines of an automobile, no smoke should be allowed to come out of the exhaust pipe. It is wholly unnecessary and is simply an evidence of carelessness and incompetence.

"Third—That the use of acetylene headlights within the built up portions of the city should be prohibited. The use of these lights is very dangerous and has resulted in causing many accidents by dazzling pedestrians and drivers of vehicles coming in the opposite direction. These lights are unnecessary on the city streets, and I understand that responsible drivers of their own volition refuse to use them."

Elasticity of Multiple Disc Clutches.

One of the most advantageous features of the multiple disc clutch in contradistinction to the ordinary cone pattern, is its elasticity from the designer's point of view. By varying the number of discs in use the capacity of the clutch may be altered to suit any possible requirement, so that it is possible to use the same discs in the clutches applied to several different sized models. The same advantage also applies to corrections in clutch design found necessary after the trial model has been on the road for some little time. Furthermore, the fact that the discs may be made very cheaply and in large quantities adds to the advantages of the device.

Vehicle for Freight or Passengers.

A most plausible development of the commercial vehicle has just been introduced by a British manufacturer in the shape of a controvertible body suitable for carrying either passengers or goods. The sides of the top are normally closed and the vehicle takes the form of an ordinary luggage van. Upon occasion, however, the sides may be removed leaving a plain canopy top, while side seats may readily be installed in the interior. The machine is propelled by a 10 horsepower motor and in passenger carrying commission, is capable of accommodating eight persons inside besides two with the driver on the front seat.

MOTOR LINE ON TEXAS PRAIRIES

Automobiles Supersede Stages on a Forty-five Mile Route—Cowboy Chauffeurs Run Them on Schedule Time.

It wasn't Jules Verne who first thought of a motor stage line across the Texas prairies. R. C. Burns of Lubbock-in-the-Panhandle—big, tall, with cheeks blistered by the sun in spite of his wide brimmed gray hat—originated the plan and has seen it to a successful realization. Five automobiles now make regular trips on a three-hour schedule over the 45 miles between Lubbock and Plainview, the county seat of Lubbock and Hale counties. The line has a private right of way, with cattle guards across the ranch fences as if for a railroad, and a path is kept scooped free of sand. The chauffeurs are cowboys, attired in blue overalls and felt hats instead of the regulation motor costume. But though they are not mechanical experts they can push the lever to the last notch as well as any race driver, and not without reason, for they are required to make the 45 miles in three hours because the line carries the mail and is under contract to the government to keep that schedule. Often the mail arrives an hour early, but in only one or two instances has it been late.

Before Burns began his automobile line the traffic was carried on by stages. Lubbock is in the center of the Panhandle district, where many homeseekers are going and so has a brisk trade. The charge is not exorbitant, considering that the automobile line is the only means of transportation between Lubbock and Plainview. Burns's charge for the round trip of 90 miles is $10; he receives $50 a day for hauling the mail. One of the cars is used exclusively for handling the mails and express, and as a brisk trade is driven in the latter, the line has been most profitable to the promoter.

The line was formed only a few months ago when Burns purchased five 24 horsepower cars of a popular make, and equipped them with extra wide tires on account of the heavy sand. Then he ordered twelve extra shoes, twelve spare inner tubes, two barrels of batteries, twenty-four spark plugs and two extra transmissions. A completely furnished machine shop completes the equipment of the motor car road.

The line has been so profitable that Burns has planned to extend it to Big Springs, Texas, one-fourth of the way across the State. Burns is confident that he can make a "go" of it. Before the railroad ran to Amarillo his stage made a round trip of 220 miles between Big Springs and Lubbock, and as that was successful he figures that he can save money and get increased business by the adoption of automobiles in lieu of the old time system of horses and lumbersome stages.

AUTOMOBILES AID STATE THRIFT

What They Have Paid Massachusetts in License Fees and Fines—Report of the Highway Commission.

Automobiles supply material for a considerable portion of the annual report of the Massachusetts Highway Commission for 1907, and among other things they are, of course, held to be largely responsible for the rapidly increasing cost of road maintenance which is alleged therein. The report says:

"The destructive work of automobiles during the past year was even more marked than it was in 1906. The Commission has made a careful study of this problem, both in Massachusetts and in neighboring States." During 1907 some roads were treated with a preparation of tar, and regarding this work the report says: "It is hoped and believed that these methods of treatment will eliminate the dust and prevent ravelling of the surface at a cost that is not unreasonable." The Highway Maintenance Fund," derived from the re-registration of automobiles in the summer, amounted to $43,616.43, and it is believed that an equal or larger amount will be derived from the re-registration now in progress. The Commission asks that the Legislature appropriate from this fund as early as possible in the session, as much preliminary work must be done in the spring. The Commission recommends an appropriation of $75,000 for special treatment made necessary by automobile wear.

The report shows that during the year the commission received $92,091.50 from its automobile department work, this being in fees for registration and re-registration of motor vehicles and for licenses for operators. Under that part of the law requiring that courts and trial justices keep a full record of every case in which a person is charged with a violation of the automobile acts and send an abstract of these records to the Commission there were received 1,112 abstracts. These indicate that during the year 1,026 persons were convicted of unlawful automobiling, 65 appealed, 41 were found not guilty, 106 complaints were placed on file, 12 were nol prossed, and in 12 the defendants defaulted. Among the causes of conviction were: Over-speeding, 604; reckless operating, 19; operating while intoxicated, 5; improper display or lack of register number, 67; operating without carrying license, 127; operating without carrying registration certificate, 28; operating an unregistered motor vehicle, 7; refusing to stop when signaled by officer, 12; operating with unlighted lamps, 54; operating without numbers on lamps, 108; violation of park rules, 91; miscellaneous offenses, 24. The total amount of fines reported to have been paid on account of improper automobiling is $11,560.21.

The Commission revoked twelve licenses and six registration certificates for reckless operating; five licenses and two certificates for operating while intoxicated. Fifty-five complaints of careless or reckless driving were heard and twenty-six licenses and five certificates were suspended or revoked in addition to those above mentioned. The total number of licenses and certificates suspended or revoked was fifty-six. Concerning this aspect of automobiling the report says:

"There seems to be a growing sentiment throughout the Commonwealth that the safe and sane operating of these vehicles can best be accomplished by filing with the Commission complaints against careless or reckless operators, with the purpose of suspending or revoking the licenses of such operators. There is a weakness in the present law which does not give the Commission authority to summon witnesses and pay witness fees. Many apparently strong cases against operators are not presented to the Commission because, for various and obvious reasons, witnesses to the facts cannot be prevailed upon to testify as willing witnesses. If hearings of this kind are to be given, to be effective, the Commission should be empowered to summon witnesses and pay witness fees, and the Commission recommends that such action be taken by the Legislature.

"In connection with this part of the commissioners' work, it would seem proper that they might, in certain cases, take the initiative and cause aggravated cases to be brought before them for a hearing. This would, of course, imply a preliminary investigation by the Commission or by investigators working under its direction. In accordance with an opinion of the Attorney General, the present law does not give to the Commission authority to investigate cases of apparent reckless operating, but it appears that this could easily be done through the State police department, and the Commission recommends the passage of an act to provide that the State police shall look up cases of reckless operating when requested to do so by the Commission, and present the cases so investigated to the Commission at a formal hearing, notice of which shall be served on the person complained of.

"The Commission has sent a great number of cautionary notices to operators who commit minor offenses. It is believed that these notices produce a noticeably good effect. During the year the Commission has found it necessary to examine applicants for licenses to operate motor vehicles for hire, in order to be satisfied that the applicant is a proper person to receive such a license. There were 1,415 persons examined; 1,222 passed the examination successfully and 193 failed. Of those who passed 50 required a second examination and eight a third.

"The Commission issued a registration certificate to a member of the diplomatic corps at Washington without fees, in accordance with the international laws. The fees, however, were paid by another person. The Commission recommends an amendment to the law, to provide that members of the foreign diplomatic corps may receive registration certificates and operators' licenses without the payment of fees therefor.

Guild Suggests Another Shakedown.

Massachusetts, speaking through Governor Curtis Guild, Jr., manifests lack of satisfaction with the result of the shakedown to which automobilists in that Commonwealth were subjected last year, and apparently another one is in order. In his inaugural address on January 2d the governor complained to the legislators that they had adopted his recommendation of the year previous only in part. He expressed his desire for further legislation along the same line, giving to his recommendation a flavor of righteousness by pointing out the injustice of taxing big touring cars and the little runabouts all alike. He said:

"Last year the General Court adopted in part my recommendation that the automobiles, which more than any other vehicle destroy the surface of the State highways, should be made to pay through a tax in the form of an annual registration fee, for the repair of the roads they destroy. The present tax is inequitable. It should be so graded that the heavy touring car, which does serious damage, should not escape as at present with exactly the same light tax laid on the small and comparatively harmless runabout."

Chicopee Orders Fire Fighting Machine.

Chicopee, Mass., is to have an automobile fire fighting engine which will be a combination chemical hose and ladder truck. The contract was awarded to the Knox Automobile Co. on Friday, 3d inst. The truck, the first one of its kind, will be installed in the Willimansett section of the city. It will be a 1908 model four cylinder, 40 horsepower, three-speed, air cooled gasolene machine. It is to have a speed of 20 miles an hour in order to get the necessary hill-climbing power and will be built to ascend grades at from five to fifteen miles an hour, according to the percentage of incline.

Its fire-fighting devices will consist of two 25-gallon Halloway chemical engines with 300 feet of hose with two sizes of nozzles; two three-gallon hand extinguishers; 1,000 feet of standard hose, with two sizes of nozzles; one 24-foot extension ladder; 13--foot roof ladder; two of the latest design lanterns; ceiling pike, plaster hook, crowbar, door opener and two firemen's axes. The whole outfit will weigh 7,500 pounds. The wagon will carry two men and three men will be instructed in the Knox factory. The contract price for the machine is $5,000.

LAW COMPELS VIOLATION OF LAW

So Says a Would-be Law Abiding Jersey Motorist of the Frelinghuysen Act—His Tale of Transgression.

Answering his own question as to whether the law has a right to make a man a criminal in spite of his own effort to avoid it a member of the New Jersey Automobile and Motor Club gives the following narrative of some of his experiences under the Frelinghuysen law:

"Two years ago, when I first got my car, I had read for months and months previous all the automobile matter I could lay my hands on, as I suppose does every beginner, and I had formed my own opinions. Then I read that in such and such a town one of the prominent motorists, on finding that the law was to be strictly enforced by the local authorities, immediately obtaining a red flag, warned every automobilist who entered the village. Now, in my innocence, I considered this defiance of the law, for the majority of which I had always entertained a great respect, and I at once concluded that when I finally got my machine and learned to drive it, I would demonstrate to my motoring friends, who had declared it to be impossible, how really easy it was for every man to adhere not only to the spirit, but the letter, of the law. My experience may be interesting to some others.

"After I had fairly learned to drive I had my car equipped with a speedometer as a prime requisite in knowing definitely myself that I was well within the speed limit. Then I sallied forth to show the world how law-abiding I could be.

"For this demonstration I selected one of the busiest streets in Newark, although one not actually blocked by the traffic. Keeping a watchful eye on the speedometer, I drove quietly along this thoroughfare, always keeping about a mile or so under the speed limit. The result was astonishing, to me at least.

"First I took to the car tracks, not from any premeditated reason, but by chance. The first thing I knew a trolley car came ambling up behind me and the motorman rang his gong. I glanced at my speedometer, saw I was just about at the limit of the law, and held to the tracks. Frantically the motorman stamped on that bell, then tried the tactics of bringing his car up with a swoop as near as he dared, and attempting to scare me off in that fashion. Having established to my own satisfaction that a blockade of trolleys would soon result if I held to the tracks much longer, I swerved to the right and held my pace.

"Now, this particular street is narrow and there is scarcely more than enough room for one good-sized wagon on each side of the trolley tracks, and the trolley cars themselves run very frequently. What had that to do with the question? you ask. Simply that drivers of carriages, other automobiles, and even light delivery wagons and large trucks, swore at me for blocking the street by my slow going, when, mind you, I was going at the limit the law allowed.

"Several other times I tried this experiment in other parts of the city before I gave up my first ideas as to the justice of the law and acknowledged that if I were to drive an automobile it must make of me a criminal against my own wish.

"To many this may seem a quibble, but to me it seems that there is something immoral in such a state of affairs. When a man learns that he cannot abide by the provisions of any particular law he immediately loses his respect for that act, and for the justice of all laws, and ten to one he will conclude that if he cannot obey some one provision, that the law is all wrong and he has no moral duty to follow in obeying other provisions which are in every way just and really needed for the good of automobilists in general."

Santa Claus with the Bay States.

By the visit of "Santa Claus" to the Bay State Automobile Association on New Year's eve, 31st ult., Boston becomes a rival of Philadelphia in things dilatory. Custom and tradition has long decreed that the visit of this mythical philanthropic saint shall take place on Christmas eve, but he did not reach the Boston automobilists this year until one week later than schedule.

D. B. "Pinkey" Price served as Santa Claus, though what "Pinkey" should want in Philadelphia is beyond explanation. "Bob" Ross and C. E. Wheeler helped hold the heavy bag of presents for all the good little motorists.

J. W. Bowman got a six-cylinder toy bank and E. A. Gilmore was handed a drum with instructions to "beat it." Gilmore took the advice literally and not as implied for instead of running home he remained at the club house and beat a lively funeral march each time a member was called up for his present. Fred O'Brien was a bit confused when he received a number of children's toys, while George Crittenden did not know how to take his gift of a pair of young goggles, a cooling fan, and other commodities. Lucius Tyler, who has figured in non-stop runs, got a tame sheep and a bank for his savings. V. A. Charles has games and toys enough to keep him amused until show time, and Harry Howlett will no longer have to go to Nantucket to shoot rabbits, as "Santa Pinkey" gave him a pair.

As George W. McNear has been a good secretary he was liberally remembered with a number of small though appropriate articles. "Al" Measure received a pair of nice old-fashioned woolen socks to keep him warm while hunting up tire business.

Everybody present got something amusing, and good humor and fun prevailed.

NANTUCKET'S LONE AUTOMOBILE

Though Confined to Railroad Tracks It is Preparing the Islanders for Progress—Two Bigger Ones Promised.

Nantucket is becoming progressive in spite of herself. The right little, tight little island has not given up its determination to keep the automobile off the public roads, but it has permitted the Nantucket Central Railroad to operate an automobile locomotive on the rails. This was an experiment on the part of the railroad company, and it has proved so successful that several others are to be added to the equipment.

This railroad is not a big nor a rich one, but Nantucket, although it constitutes one of the counties of Massachusetts, is not a big island. The old whaling port of Nantucket is its one town, and at the other end of the island there is a village named Siasconset, but invariably called 'Sconset. The railroad, 8.50 miles in length, connects the two places, but until the automobile locomotive was introduced early this winter the connection has been only for the summer season. It is doubtful whether the second-hand, narrow gauge steam locomotive—a veteran handed over by the Boston, Revere Beach and Lynn Railroad—which made eight trips daily between Nantucket and 'Sconset during the summer would be equal to more than one daily during the winter.

Not only are the islanders having a winter service, but they are making the Nantucket-Siasconset trip in better time than was possible with the old locomotive. Seventeen miles an hour was the rate of travel until the automobile got on the rails. The experimental car is a small one, with capacity for nine persons, but it is capable of better than seventeen miles an hour. It is the precursor of two larger ones to be built for next summer's travel, each of them to be of 60 horsepower and capable of carrying 35 passengers.

Jail and Prisoner Disappeared.

There is no jail at Elwood, N. J., a place midway between Atlantic City and Philadelphia. There was a temporary one there on Monday last, but it disappeared during the night with a prisoner. He was a chauffeur who had been placed in durance for refusing to submit to a ruling made by Justice of the Peace Carver, who is the terror of speed loving automobilists in that section. The constable had placed him in a freight car, which stood on a siding and made him comfortable for the night with a cot, and then went home to his own bed. A freight train picked up the car during the night and took it to Camden where the prisoner narrowly escaped arrest for stealing a ride. He got clear by the aid of a dollar, and wired Justice Carver saying, "Trip pleasant; arrived safely."

The Week's Patents.

867,474. Device for Inflating Tires, etc. Robert H. Campbell, Edmonton, England, assignor to Aerators Limited, Angel Road, Edmonton, England. Filed Sept. 20, 1906. Serial No. 336,730.

1. A device for inflating pneumatic tires and for other purposes; the said device consisting of a cylinder provided with a valve and an attachment provided at one end with means for opening the valve and at the other end with means for attachment to the nozzle of the inlet valve of the tire, or the equivalent, to which gas is to be supplied, the said attachment also being provided with a branch therefrom carrying a pressure gauge.

867,503. Automobile Sleigh. Frederick Hartje, St. Thomas, N. D. Filed May 24, 1907. Serial No. 375,379.

1. In an automobile sleigh, a series of drive wheels adapted to engage the surface traversed, arms supporting the shaft of said drive wheels, a transverse bar to which the inner ends of said arms are connected, means for rocking said arms to raise or lower said shaft and drive wheels, a sleeve encircling said transverse bar, a motor, and connections between said motor and sleeve and said sleeve and drive wheel shaft for rotating the latter.

867,515. Tire Protecting Device. Leonard H. Kinnard, Harrisburg, Pa., assignor of one-half to Rollin S. Chamberlin, Harrisburg, Pa. Filed Dec. 8, 1904. Serial No. 235,932.

1. A tire protecting device composed of a shoe in which the tire fits, a stay consisting of a stiff endless ring fastened only to the shoe at one edge thereof, another similar stay, and a fastening connecting the shoe at its other edge with the latter stay, said fastening being adjustable to draw the edge of the shoe towards the stay.

867,588. Rim and Tire Construction for Vehicle Wheels. Montford P. Morrison, Atlanta, Ga. Filed Nov. 5, 1906. Serial No. 341,987.

1. A rim and tire construction for vehicles, comprising a rim member provided in its outer face with a deep annular channel the walls of which are parallel, said rim member being provided at the opposite sides with two projecting parallel annular flanges between which are deep annular grooves the walls of which are parallel, an elastic device placed in said channel, and an annular tire member provided with a central inwardly directed annular portion which fits in and is movable in said channel and which bears on said elastic device and the side walls of which are parallel, said tire member being provided at the opposite sides of said inwardly directed annular portion with deep annular grooves the side walls of which are parellel, said grooves being adapted to receive the inner flanges of the rim member, and said tire member being also provided at its opposite sides with inwardly directed parallel annular flanges adapted to enter the grooves formed by the flanges at the opposite sides of the rim member and the walls of which are parallel, said tire member being free to move in and on said rim member.

867,600. Vehicle Tire. Albert D. Ray, Cleveland, Ohio. Filed Nov. 7, 1906. Serial No. 342,362.

1. A tire comprising a flanged rim having a hole therein, a casing on the rim having a split base with shoulders at the sides engagable with the flanges, a flexible band extending lengthwise around within the casing upon the base thereof and having flexible ends extending through the hole, means to fasten said ends, and a resilient filler within the casing.

867,604. Carburetter. William F. Rothe, East St. Louis, Ill. Filed Sept. 18, 1905. Serial No. 278,858.

1. In a carburetter, a cylindrical member provided with an interiorly arranged spiral passageway, means whereby oil is discharged into the cylindrical member in front of the spiral passageway, means whereby the discharge of oil into the cylindrical member is regulated, and an adjustable member arranged beneath the oil inlet to receive the excess discharge of oil; substantially as specified.

867,605. Fuel Valve Controller for Hydro-Carbon Engines. William F. Rothe, East St. Louis, Ill. Filed Jan. 12, 1906. Serial No. 295 785.

1. In a device of the class described, the combination with a carburetter, of a valve for controlling the supply of hydrocarbon to the carburetter, the stem of which is screw threaded; a beveled pinion fixed on the upper end of the valve stem, a horizontally arranged shaft, beveled pinions on each end thereof one of which meshes with the pinion on the valve stem, a vertically arranged shaft, a beveled pinion on the lower end thereof which meshes with the pinion on the opposite end of the horizontal shaft, angle frames loosely mounted on the ends of the shafts around the meshing beveled pinions; and an operating handle fixed on the upper end of the vertical shaft; substantially as specified.

867,608. Photographer's Car. Jean Jean Schmidt, Frankfort-on-the-Main, Germany. Filed Aug. 16, 1906. Serial No. 330,934.

1. The combination with a photographer's car and a source of electricity carried thereon, of a drum on said car, and a conductor wound on said drum and connected with said source of electricity and also adapted to be connected to a lighting device, substantially as and for the purpose described.

867,614. Wheel. Benjamin C. Seaton, St. Louis, Mo. Filed June 7, 1906. Serial No. 320,669.

1. A wheel comprising a felly, an outer rim having a tread connected thereto, a plurality of independent arms formed separate from the felly to which they are connected and arranged alternately on the opposite sides thereof, independent arms formed separate from the outer rim to which they are connected and arranged alternately on the opposite sides thereof, transversely arranged tension springs connected to the arms on the felly and outer rim that are located opposite each other, and co-operating means on the outer rim and the arms connected thereto for preventing said arms from twisting; substantially as described.

867,616. Pump. Stephen G. Skinner, Chicago, Ill. Filed March 30, 1905. Serial No. 262,838.

In a pump of the described class, the combination of a base; inner and outer stationary cylinders rigidly connected therewith; a tubular piston rod extending downwardly between the upper ends of the cylinders; a piston on the lower end of said rod having a down-turned cup leather working on the inner surface of the outer cylinder; and a piston on the inner cylinder having an up-turned cup leather working on the inner surface of the tubular piston rod, said piston rod being provided with a valved passage leading to the interior of the rod from below the first mentioned piston, and said inner stationary cylinder being provided with a valved passage leading to the interior of the inner cylinder from above the other piston.

867,627. Induction Coil Apparatus. Ernest C. Wilcox, Meriden, Conn., assignor to The Connecticut Telephone and Electric Company, Incorporated, a Connecticut Corporation. Filed June 19,1907. Serial No. 379,731.

1. In an ignition system, the combination of an ignition device, a source of primary current, an induction device having its primary in circuit with the source of current and having its secondary in circuit with the ignition device, a vibrator in the primary circuit and having an adjustable member, a condenser shunted across the terminals of the vibrator and proportioned to the normal current consumption, and means for indicating the correct adjustment of the vibrator at the normal current consumption.

867,710. Wheel. William Eichers, Minneapolis, Minn. Filed Jan. 7, 1907. Serial No. 351,063.

1. A wheel comprising a rim and tire, a ring of channel bar iron concentric with said rim and having its flanges extending inwardly toward the said hub, a hub within said ring having outwardly extending annular flanges, the space between said flanges corresponding substantially to the width of said ring, bolts connecting said flanges, coiled springs having their inner ends connected to said bolts and their outer ends adjustably connected to said ring, and plates secured on the flanges of said ring and having sliding contact with the flanges on said hub, substantially as described.

867,713. Valve for Explosive Engines. Joseph S. Elverson, Catasauqua, Pa. Filed Feb. 6, 1907. Serial No. 355,977.

1. In an explosive engine, a cylinder, a head for closing the cylinder at one end and having a semi-circular opening, a valve having a semi-circular opening, reversed in respect to the opening of said head, said openings arranged when brought with their curved portions into alignment with each other to form combined, an opening of gradually increasing size.

867,717. Tire Covering. George R. Eukers and Robert H. Atcheson, Chicopee, Mass. Filed April 3, 1906. Serial No. 309,583.

1. A tire covering consisting of a body comprising a plurality of circularly coursed bands arranged to conform to the shape of an annular trough, and a multiplicity of metallic link-like tubes engaged with and connecting each of said bands with another thereof which is transversely there beyond, said tubes being provided in such number and having such proximate arrangement as to produce a flexible metallic tread and protective portion for the appliance.

867,748. Mechanical Movement. William B. Norton, Detroit, Mich. Filed Oct. 16, 1905. Serial No. 282,912.

1. In a mechanical movement for converting motion, in combination with a plurality of radially disposed cylinders, a plurality of pistons therefor, connecting rods pivoted to said pistons, a shaft central to said cylinders, a crank on said shaft, a wrist plate having a rotating connection with said crank and provided with sockets in which the ends of said connecting rods engage,

Digitized by Google

the boundaries of said sockets being adapted to limit oscillation of the plate with respect to the several connecting rods, substantially as described.

867,756. Elastic Tire. Jacob W. Rock, Akron, Ohio. Filed Aug. 13, 1906. Serial No. 330,352.

1. An elastic vehicle tire provided with a plurality of holes, said holes extending from the tread portion thereof inwardly and arranged at an angle to the radii of the wheel on which said tire is mounted.

867,765. Automatic Steering Mechanism for Vehicles. William H. Strickler, Chicago, Ill. Filed Feb. 19, 1907. Serial No. 358,281.

1. The combination with a car having independently pivoted wheels, and means including a laterally movable part for connecting them, of automatic steering mechanism having a fixed guide, a runner engaging said guide and means for connecting the runner to said laterally movable part.

867,790. Attachment for Automobiles. Harry J. Carr, Sumter, S. C. Filed July 2, 1907. Serial No. 381,859.

1. The automatic attachment herein described, comprising the drum for application to a cranking shaft, and having a longitudinal bore or opening to receive the said shaft, a transverse opening intersecting the said longitudinal bore or opening, and ratcheted at its outer end for engagement by a crank handle, substantially as set forth.

867,795. Automatic Engine Starter. Clyde J. Coleman, New York, N. Y., assignor to Conrad Hubert, New York, N. Y. Filed Feb. 26, 1906. Serial No. 303,130.

1. An engine starter comprising a power-storing device, an engine actuating member normally connected to rotate with the engine, means for rotatably connecting the power storing device and the engine actuating member to start the engine, said means being constructed and operating to operatively engage the engine actuating member only when the power starting device tends to rotate faster than the engine and being movable out of engagement by the relative rotation of the engine actuating member during the normal operation of the engine, and frictional means for holding said connecting means out of engagement until the starter is again thrown into operation to start the engine.

867,796. Engine Starter. Clyde J. Coleman, New York, N. Y., assignor to Conrad Hubert, New York, N. Y. Filed Nov. 12, 1906. Serial No. 342,999.

1. In a starter for engines, the combination of a hydraulic motor, means engageable only in one direction of movement for connecting the motor to the engine to start the engine, a source of motive liquid under pressure connected to the motor, and means for returning the used motive liquid to its source.

867,797. Engine Starter. Clyde J. Coleman, New York, N. Y., assignor to Conrad Hubert, New York, N. Y. Filed March 13, 1907. Serial No. 362,102.

1. In an engine starter for multiple cylinder internal combustion engines, the combination of a carburetter, fluid carrying connections from the outlet of the carburetter to the inlets of the respective cylinders, manually actuatable means for concurrently opening an outlet from each cylinder, an atmospheric air inlet for the carburetter, means for closing the atmospheric air inlet, a source of compressed air communicating with the carburetter, and a manually actuatable valve in control of such communication.

867,851. Automobile Tire. George G. Sullivan, Buffalo, N. Y. Filed Nov. 13, 1906. Serial No. 343,183.

1. A link shield arranged between layers of rubber fabric and provided with rings connected therewith, partially surrounding rubber cores.

867,859. Carburetter. Edmond M. J. Weinat and Joseph Bogey, Chicago, Ill., assignors, by mesne assignment, of three-fourths to Andrew A. Brock, Chicago, Ill. Filed April 7, 1905. Serial No. 254,310.

1. In a carburetter, an oil reservoir containing a float and an inlet valve governed

thereby, and having an outlet formed by an annular series of multiplex small passages, in combination with an annular air inlet valve for the carburetter surrounding said reservoir.

867,887. Means for Operating Fare and Distance Indicators. Otto Kuntzen, Berlin, Germany. Filed Oct. 19, 1905. Serial No. 283,543.

In combination with an indicator, a cam wheel adapted to be actuated from the wheel of a vehicle, a sliding rod provided with shoulders between which said cam wheel revolves and by means of which it imparts a positive to and from movement to the rod in both directions, and means whereby such motion is transmitted from the rod to the indicator.

867,988. Armor for Tires. Charles P. Mays, Washington, D. C. Filed July 13, 1906. Serial No. 326,065.

1. An armor for tires, consisting of a series of independent protecting sections, projections formed on the sides of said sections, segmental bands extending completely around the sides of the tire and each provided with a groove in its side for engaging the projections to hold the protecting sections in position, each of said segments being of a length to engage the projections on a plurality of the sections.

868,014. Automobile. Edmund W. Roberts, Clyde, Ohio. Filed March 17, 1905. Serial No. 250,503.

1. In an automobile, the combination with running gear comprising a driving wheel, of a combined internal combustion and compressed fluid multi-cylinder engine in permanent driving connection with such driving wheel, said engine comprising cylinders serving normally as cylinders of an internal combustion engine and provided with valves and valve gear for admitting fluid under pressure to said cylinders to operate the engine as a self-starting compressed fluid motor, the cylinders and associated parts and valve gear arranged to produce at least three impulses per revolution when operated as a compressed fluid engine, and means for supplying fluid under pressure to said engine comprising a reservoir, a compressor, an auxiliary internal combustion driving engine therefor, and automatic controlling means operated by rise and fall of pressure in said reservoir and controlling the operation of said compressor engine and comprising automatic starting means therefor.

868,047. Vehicle Wheel. George S. Whiteley, Baltimore, Md. Filed April 18, 1906. Serial No. 312,375.

1. In a vehicle wheel the combination of an inner wheel having spokes and an iron rim, an outer wheel having an iron rim and a rubber tire and between said wheels a series of S-shaped springs having on their inner end a spring plate, secured thereto and a pivot bolt between said spring and spring plate, and side plates receiving the ends of the pivot bolt.

868,079. Tire for Wheels. Herbert B. Ewbank, Jr., New York, N. Y., assignor to Harry A. Taylor, New York, N. Y. Filed July 25, 1906. Serial No. 327,615.

1. A wheel having on its periphery a central vertical annular flange having concave seats at its opposite sides, a series of outwardly bowed transverse plate springs arranged around the wheel with their adjoining ends coiled and disposed at opposite sides of said flange in sliding engagement with said seats, means retaining said springs and guiding them in their sliding movements against said seats, and an exterior rubber tire inclosing said springs and secured to the wheel; substantially as set forth.

868,081. Controller for Motor Vehicles. Clark E. Frear, Lake Winola, Pa. Filed Jan. 2, 1907. Serial No. 350,458.

1. A controller for motor vehicles, having a pivotally mounted wheel whose hub has an external circumferential groove upon its inner end, a controller plate movably mounted upon and engaging the axle of said vehicle and provided with an inwardly projecting flange engaging said groove, and means for shifting said plate.

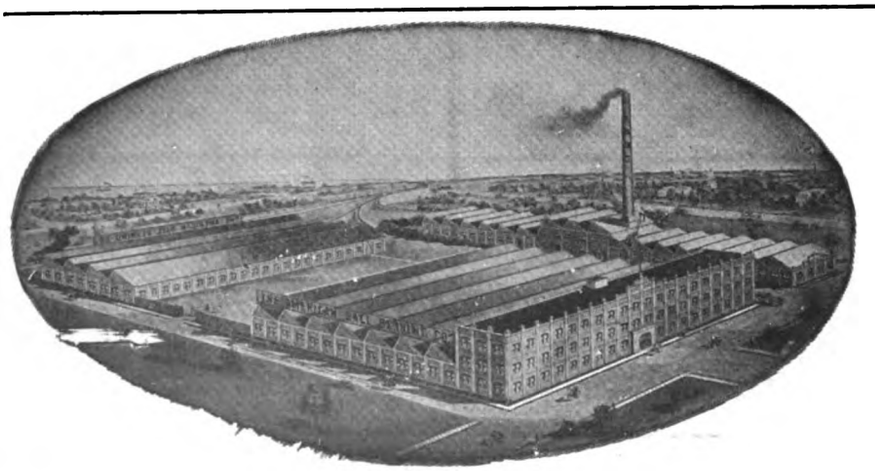
868,105. Gage for Rolls in Roller Bearings. Charles S. Lockwood, Newark, N. J., assignor to Hyatt Roller Bearing Company, Harrison, N. J., a Corporation of New Jersey. Filed Oct. 25, 1906. Serial No. 340,434.

1. A sheet metal cage, for hollow bearing rolls, having annular heads at the ends, integral guide bars connecting such heads and integral flexible prongs projected from at least one of the heads between the guide-bars to penetrate the rolls and hold them in place.

868,202. Internal Combustion Engine. Norman Macbeth, St. Annes-on-the-Sea, England. Filed March 6, 1907. Serial No. 360,961.

1. An internal combustion engine having parallel explosion cylinders, admission ports in one cylinder, exhaust ports in the other cylinder, a common combustion space, a centrally disposed air and fuel charging pump located nearer the crank shaft, pistons in said explosion cylinders and working parts, said explosion cylinder cranks pistons and working parts being set at opposite angles to and balancing the charging pump crank piston and working parts for the purposes and as set forth.

868,207. Resilient Tired Wheel for Automobiles and Other Vehicles. Abram C. Monfort, Providence, R. I. Filed May 25, 1906. Serial No.



1. In a resilient tired wheel for automobiles and other self-propelled vehicles, the combination with a suitably mounted rim, a pair of oppositely disposed annular plates rigidly secured to and extending radially beyond the rim, and an annular pneumatic or inflatable tire located between said plates and seated in the outer periphery of said rim, of a plurality of radially arranged independently movable and laterally separated inelastic sections having their inner or lower sides bearing against and being supported by said tire, means for limiting the movements of said sections, the ends of the latter transversely of the wheel being constructed so as to form narrow spaces between them and the adjacent inner faces of said plates, an annular flexible and compressible traction tire member in direct contact with the outer periphery of said sections provided with integral side flanges extending downwardly into the said narrow spaces, and means for maintaining the traction tire in position upon said section.

868,208. Device for Preventing Slipping of Motor Driven Vehicles. Alban S. Moore, London, England. Filed Aug. 17, 1906. Serial No. 331,080.

1. Apparatus for preventing side slipping or skidding of motor driven road vehicles, wherein an additional rearward wheel, driven from a motor, is coupled to and operated by the steering mechanism, so that it will be caused to change to any required extent, the direction of its motion and gripping power on the road surface, simultaneously with, and approximately corresponding to the direction of travel of the steering wheel, or wheels, of the car.

868,304. Hydraulic Clutch and Transmission Device. Clarence H. Tingley, Unionville, Mo. Filed Nov. 30, 1906. Serial No. 345,745.

1. The combination in a clutch, of a stationary fluid reservoir, two relatively rotatable members having contiguous ends inclosed in said reservoir, pump pistons carried by one member in eccentric relation thereto, pulp cylinders carried by the other member and equi-distantly located with relation to its axis, fluid inlet ducts from the reservoir to the pump cylinders, outlet ducts from the pump cylinders to the reservoir, and means for constructing the outlet ducts to regulate the degree of clutching action.

The output of complete Front and Rear Automobile Axles of this plant exceeds the capacity of all competition combined.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

The Great Arrow SIX-Cylinder

THE GREAT ARROW is now being built with six cylinders, because we believe that it is the next step in the development of the touring car. The advance from four cylinders to six is no more radical than the advance from two cylinders to four. Because we believe that six cylinders will give to a car greater efficiency, smoothness and comfort, we have put six cylinders in the GREAT ARROW for the coming season. We did not do this until we tried out the six-cylinder idea very carefully.

IT is possible to state in print the manifest advantages of six cylinders over four, but no statement, however technical or however complete, will be as convincing as an actual demonstration of a six-cylinder car. The best description of the effect of riding in a car driven by six cylinders is that it is like coasting down a fifteen per cent. grade with the clutch thrown out. It is the nearest thing to gliding that has ever been produced by machinery, so much so that we believe that the six-cylinder is the nearest thing to a perfect application of power for a touring car that has yet been devised by engineers.

HERE ARE THE 1908 TOURING CARS

Good for Every Day in the Year—and Always Good

WINTER or Summer, Fall or Spring, rain or snow—why shouldn't the dealer enjoy remarkable—almost phenomenal sales—of this remarkable car? What vehicle appeals more to women who demand style, comfort, safety and convenience? What electric vehicle of any other make combines all the good points of this

Pope-Waverley

Model 70-C Victoria Coupe?

"The electric is the simplest of all automobiles—the Pope-Waverley is the simplest of all electrics."

We want every dealer in the country to know the masterpiece in construction of the largest Electric Vehicle Manufactory—we want to illustrate how the heavy plate glass windows may be raised or lowered at will—within the doors—how the front window swings inward affording perfect ventilation—how the beautiful upholstering and hardware leave nothing to be desired.

We want to show every dealer how the entire top may be easily and readily removed without detracting in a single instance from the symmetry and completeness of either type.

Why not write for our complete catalogue and an interesting, instructive little booklet called "Profitable Electric Garaging?" We'll send it to you postpaid at once.

I Want You To Know Why

The "Maxwell"

Is The Car For You

20 H. P.—$1,450 fully equipped.

Motor-car value can only cost about so much—after that you're paying fancy prices for superfluous horse-power that swells your gasoline, oil and repair bills—that you cannot utilize, and keep within the law.

The "Maxwell" gives one full dollar's worth of **car value** for every dollar it costs.

It does not boast high horse-power, but delivers on the road right up to its **rated** horse-power.

The "Maxwell" Tourabout is a 14 horse-power car; the double cylinder Touring Car, 20 horse-power, and the new 4 cylinder Touring Car, 24 horse-power. In relation to the weight of these cars, this is just enough more than you need, so that you always have "something up your sleeve for emergencies."

No cars at any price have ever equalled the "Maxwell" records for efficiency and reliability.

No car of efficiency is so simple of operation or so inexpensively maintained.

The features which the "Maxwell" originated, and which motor-car manufacturers have since adopted, are alone sufficient to establish its superiority—The "Maxwell" Multiple-Disc Clutch, Three Point Suspension of Power Plant and Transmission, Single-Unit Construction of Engine Case and Transmission Housing, Pumpless Thermo-syphon Cooling System, Indestructible Metal Bodies.

The "Maxwell" Tourabout costs $825, the 20 H. P. Touring Car, $1,450, and the 24 H. P. Touring Car $1,750.

Considering "Maxwell" prices, the "Maxwell" records and the consensus of opinion of the 10,000 owners of "Maxwell" cars, can you think of one good reason why you should buy anything but a "Maxwell?"

Benj. Briscoe President.

DEALERS IN ALL LARGE CITIES

ADVICE TO TIRE BUYERS

WHENEVER a tire salesman tells you that the 5,000 mile guarantee on Ajax Wrapped Tread Tires "means nothing" ask him why, then, he cannot give the same guarantee on the tire HE is selling.

Also, ask him, how the makers of Ajax Tires could have increased their business 500 per cent. in 13 months on a reputation built upon a "worthless" guarantee.

And then, inquire if he can point out anyone who has found the Ajax guarantee to be anything but a SQUARE DEAL.

Rushmore Flare Front Headlight
in section, showing removable back cap

Permanent Injunction Granted Against Copying The Rushmore Flare Front Design

A PERMANENT INJUNCTION was granted on Jan. 3, by the United States Circuit Court, Southern District of New York, against the Manhattan Lamp Works, forbidding them to make or sell lamps in imitation of the Rushmore Flare Front design, or to use the words "Flare Front" in describing their product. The terms of the Judge's decision are very broad, and we shall at once proceed against other lamp manufacturers who have for the past year been trading on our reputation by the sale of cheaply-constructed imitations of the Rushmore.

Two years ago, when the American trade generally was copying a French reflector lamp, we adopted the now familiar Rushmore Flare Front as a distinctive dress. It was immediately linked in the public mind with the intense, long range beam of the Rushmore Lights, and by the fall of 1906 there was not a motorist who thought of lamps at all but recognized the optical correctness of the Rushmore, and its immense superiority over every other type offered. Other makers, seeing their trade slipping away, discarded their own models and began making copies of the Rushmore. But, lacking the means and skill to duplicate Rushmore quality—in particular the short-focus lead-glass Rushmore Lens Mirror,—they copied the shape only, using in general thinner stock, solder instead of screws and rivets, and small, cheaply-ground, green glass lens mirrors of long focus. These flimsy affairs, in many cases nearly worthless as light givers, they sought to foist on the public by cut prices, chicanery, and downright substitution. Numberless purchasers who specified Rushmores, or who did not know that every lamp and lens mirror we make bears our name, were deceived by the imitations, and laid the blame for their inefficiency anywhere but where it belonged. Thousands of others were persuaded that the imitations were "as good as the Rushmore," only to realize their mistake too late.

Of these unscrupulous practices the Manhattan Lamp Works afforded a small but flagrant example. We propose to defend to the finish our right to keep our designs exclusive, and the public's right to suppose that what appears to be a Rushmore Light is such in fact. Meanwhile we caution all purchasers to look for the name RUSHMORE etched in the lens mirror, and our firm name engraved plainly in the top of the ventilator (Rushmore Lights have no name plates).

Rushmores vs. the "Chinese Copies"

Some Usual Points of Difference

Rushmores	"Chinese Copies"
1. Heavy sheet brass; all parts held together by screws and rivets, not by solder.	Sheet brass too thin to hold screw heads or rivets, therefore solder mainly relied on.
2. Lens Mirror large, of heavy heat-resisting lead glass, ground of deep curvature and short focal distance. Removable as shown.	Lens Mirror small, of light brittle green glass, relatively flat and of long focal distance. Not removable except with soldering iron and torch.
3. Front and back of cylinder stiffened by heavy endless rings, riveted on.	Light non-continuous rings soldered in place.
4. Castings machine finished and accurately fitted. All details carefully attended to.	Castings roughly fitted, side sockets soldered, and details generally slighted where not seen.

The Car of Steady Service

as applied to the

Rambler

is more than a mere phrase, it is a title earned through correct design and careful construction and proven by years of hard, constant service wherever power-driven vehicles are known.

The practical qualities that established the Rambler reputation are,—

1st—APPLIED POWER. By this we mean actual tractive force as applied to the road wheels. Owing to the straight line drive of the four-cylinder models and the direct chain drive in the two-cylinder cars, Ramblers have greater propelling force per pound than any other car on the market.

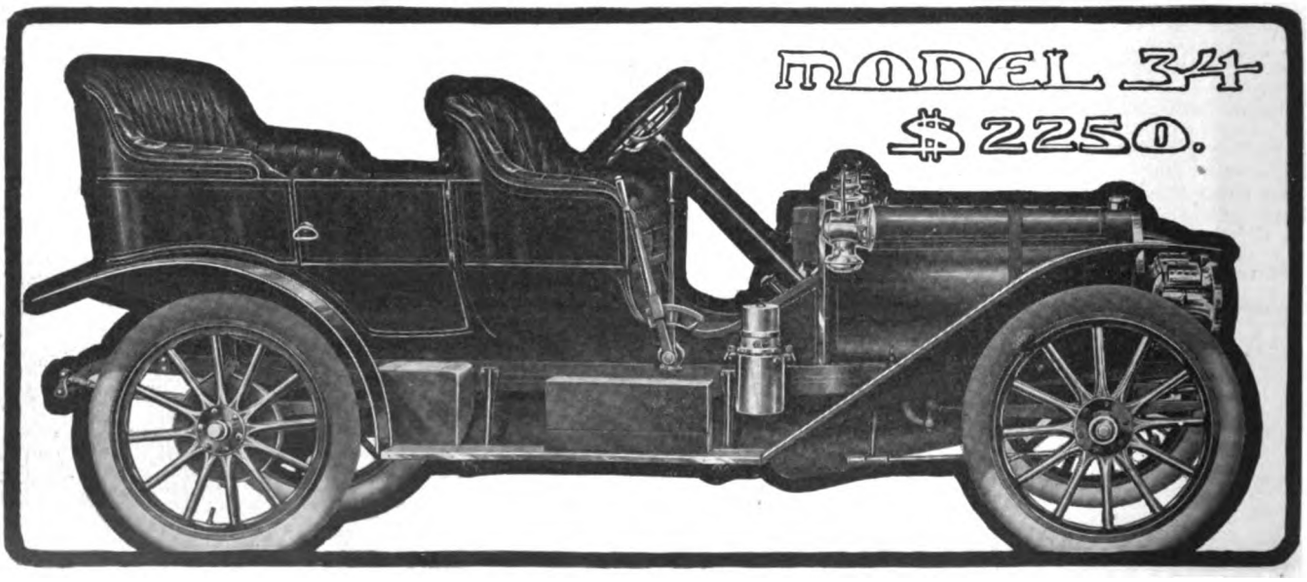
2d—DEPENDABILITY. Ramblers are built to stand the test of hard, daily service over the worst of American roads. This condition is not reached by mere weight and masses of metal, but by simple, scientific construction in which each element is stronger than the strains upon it can ever require.

3d—PRACTICAL ROAD VALUE. With the vast facilities of an enormous plant like the Rambler factory, skillfully directed to the production of two models only, greater value per dollar can be offered than is possible in a plant of lesser output.

In short, the Rambler is a car of

Power, Service and Value

Ordinary business policy dictates a careful examination of its many high qualities before ordering your new car.



Our 1908 catalog fully describing two touring cars and a high-powered roadster is at your service: write to-day.

Volume XVII. New York, U. S. A., Thursday, January 16, 1908. No. 16

MILLER PREDICTS A BUSY YEAR

His Favorable Analysis of Reports from All Sections—Business Methods Likely to be More Conservative.

It is not often that W. B. Miller, the secretary and sales manager of the Diamond Rubber Co., permits himself to be quoted in print. When he does so, it is certain that he has something worth the saying, and when it has to do with business conditions and prospects, his statements cannot but carry weight, for few, if any, are in closer or more thorough touch with the several phases of the business.

"A busy year for accessory branches of the automobile industry," is his prediction, summed up in the fewest words. "The basis of this statement is a careful analysis of reports from all sections," he says. "These reports indicate that the amount of renewal business to be done will be larger than ever before. The number of automobiles in use the past year will not be reduced. If some owners do not see fit to use their machines, the cars will pass to those who will. The number of new cars to be provided for, while not equal to that of 1907, will still reach, in the aggregate, a very large figure, making necessary in the grand total a great extent of equipment of all kinds.

"It is to be expected that business will be done along more conservative lines in all branches of the trade. The accepted forms of regular merchandising will prevail to a greater extent than formerly and high quality, particularly in tires, will be demanded because of the true economy of using such products. The far-seeing dealer and consumer are both on the quality platform, and both alike working for the greatest economy in up-keep cost. That they should do so is highly desirable. The 1908 season will undoubtedly see greater discrimination in buying exercised by all automobile owners, and the general effect cannot but be healthful and beneficial to the industry as a whole."

To Make Taximeters in This Country.

In anticipation of the growth of the taxicab a new company to manufacture the taximeter instruments in the United States has been formed under the name of the International Taxameter Co. of America. It will operate under the American patents owned by the Internationale Taximeter Co., Ltd., of Berlin, which at the present time makes a large proportion of taximeters used abroad. The company is incorporated under New York laws with $300,000 capital, of which $50,000 is preferred stock. Jacob A. Cantor, former borough president of Manhattan and an ex-State senator, is one of the leading spirits in the enterprise and J. A. Costuma is the general manager. Pending formal organization, temporary offices are maintained at 25 Broad street, New York. It is planned to lease the taximeters on a 10 cents per day basis, rather than to sell them outright, and the promoters look forward to placing 10,000 instruments in New York and its vicinity, with all the rest of the country still to be heard from.

Duryea Wins in Receivership Fight.

The action of the referee in bankruptcy in refusing to permit H. M. Sternbergh to vote his claim for $14,438.86 for the selection of a receiver for the Duryea Power Co., of Reading, Pa., of which he was president, was sustained by the United States Circuit Court on Friday last. The case was argued in October last. The effect of the decision is that there can be no further legal interference with the Berks County Trust Co., whose selection was opposed by Sternbergh and favored by Charles E. Duryea, the latter winning by a majority of one vote. It is expected that the receiver now will apply for an order to sell the property and that proceedings will be taken to compel Sternbergh to pay $26,000 which is claimed to be due for an unpaid stock subscription and which has remained in dispute.

APPRAISAL OF THE E. V. ESTATE

Report to the Court Shows a Total Valuation of $1,709,603.08—Selden and Other Patents not Included.

Excluding the Selden patent, on which, while acknowledging its earning capacity, they diplomatically declined to place a value, the appraisers of the property of the Electric Vehicle Co., Hartford, Conn., have reported to the court that the estate is worth $1,709,603.08. The appraisers, John R. Hills and F. C. Billings, pared more than $300,000 from the inventoried value of the merchandise and nearly $60,000 from the value of the book accounts. Their report shows that the New Haven Carriage Co., body builders, is one of the most profitable of the Electric Vehicle Co.'s possessions. It was purchased in 1899 for $193,578.47, and since that time has paid in dividends $211,500.

Of the Selden and other patents included in the assets, the appraisers say:

"This patent on a road engine is considered very valuable by the officers of this company, which holds the exclusive license with the right to grant sub-licenses for the use of this patent. We are informed by the receivers that the rights of the Electric Vehicle Co. in this patent have been productive of a large net income during the past five years, which income has been in excess of $500,000. This patent has still five years to run, and if the income from this source during the next five years shall equal or approximate that of the last five years, it is apparent that this patent is a valuable asset of the company. We are unable to determine the present value of the income which may in the future be derived from this source, and for this reason we have not attempted to put a definite appraisal thereon. In addition to the above, there are more than 125 other issued patents, relating directly, or indirectly, to automobiles, granted between May, 1891, and

Digitized by Google

September, 1907, and numerous applications for letters patent are pending in the United States patent office, the value of which we have no means of ascertaining and we respectfully refer to list of same. We appraise these as of value unknown. We also wish to call attention to the fact that in arriving at the grand total, we have not taken into consideration the value of the good will of the Electric Vehicle Co. as a going concern."

Following is the inventory in full:

Land in town of Hartford	$48,000.00
Spur track running to property of company	7,500.00
All buildings on property in Hartford	249,653.00
Power, electric and heating plants and accessories, consisting of boilers, pumps, heaters, filters, motors, transmission, wiring and fixtures, fire protection, including watchman's system	79,897.00
Special equipment, consisting of fuel oil system, compressed air system, plumbing for manufacturing purposes and shop fixtures (such as benches, drawers, cupboards, tanks, etc.)	9,900.00
Machinery for manufacturing purposes. (Note: Value of machinery slightly increased on company's inventory valuation for reason that said inventory shows excessive depreciation, and we estimate original cost at not less than $195,000)	165,000.00
Standard small tools such as are generally used in the manufacture of automobiles and machinery of all classes	40,000.00
Jigs and fixtures for making parts of automobiles, also dies and tools for manufacturing drop forgings for parts of automobiles	33,300.00
Patterns for making castings for parts of electric and gasolene automobiles, including metal and wood patterns (company's book value, $24,015.00)	16,000.00
Office and factory furniture, including time and cost keeping system	4,400.00

Merchandise account, itemized as below in two columns:

	Inventory Values	Corrected Values.
Finished parts stores.	$383,952.04	$255,969.00
General stores	162,094.93	129,000.00
Work in progress (parts)	154,189.35	102,700.00
Vehicles in progress.	164,930.29	123,000.00
Consigned inventory (merchandise)	3,467.13	467.00
Finished vehicles	125,635.16	110,000.00
Consigned vehicle account	17,927.11	16,200.00
Second-hand vehicles	49,884.29	12,500.00
Stationary and literature	13,279.45	5,000.00
Commerce St. stores.	18,205.95	2,000.00
	$1,093,565.70	$756,836.00

Book accounts inventoried as of December 10, 1907.

	Book Values	Corrected Values.
Suspense account amounting to	$17.006.71	
These accounts being in the hands of attorneys and collectors and many of same being very old and of doubtful value		1,500.00
Sundry debtors' account amounting to	22,383.35	
Largely consisting of unpaid royalties, which are considered uncollectable		9,000.00
Accounts receivable amounting to	104,549.51	
These accounts have been carefully investigated and $15,000 of same are considered uncollectable. We also allow 15% to cover time and cost of collection		76,117.08
Total inventory value	$143,939.57	
Total corrected value.		$86,617.08

Note: Item "book accounts" include all book accounts whether in hands of Connecticut receivers for collection or in hands of receivers in the States of New Jersey, New York, Massachusetts or Illinois, for collection by them respectively.

Consisting of the entire capital stock of the New Haven Carriage Company, located at New Haven, capitalized as follows:

2,000 shares pref. stock at $25	$50,000.00
6,000 shares common stock at $25.	150.000.00
Total	$200,000.00

The Electric Vehicle Co. purchased the entire stock of the New Haven Carriage Co. June 1, 1899, for $193,578.47. Since the said purchase the New Haven Carriage Co. has paid in dividends $211,500.00, and from statements shown is believed by us to be in good condition, having a surplus of $75,000 over all liabilities and stock. Therefore, we feel warranted in placing the preferred stock at the rate of 125 per cent. on par value, or $31.25 per share, and the common stock at the rate of 100 per cent. on par value, or $25 per share, or a

Total value of	$212,500.00
Grand total	$1,709,693.08
Total value of	12345665432

The receivers add a note to the inventory, saying there is not included in the above inventory an item of cash on hand in Hartford of $13,983.81, and assets in other jurisdictions amounting to $112,184.51.

The receivers also filed with the court the following report of business transacted by them from December 11 to December 31, 1907, inclusive:

Sales.

Charges on account	$5,209.25
Cash	10,550.94
	$15,760.19

Purchase.

On account	$1,245.96
Cash	450.52
	$1,666.48

Cash Statement.

Receipts.

Cash on hand Dec. 11	$13,983.81
Cash collected on account	10,146.14
Cash sales	10,498.99
Cash miscellaneous	51.95
Illinois accounts	2,738.40
Massachusetts accounts	40.21
	$37,459.50

Disbursements.

Pay rolls prior to Dec. 10	$12,501.16
Pay rolls receivers	11,353.93
Traveling expenses	357.39
Petty expenditures	420.52
Illinois receivers	2,207.50
	$28,840.50
Cash receipts	$37,459.50
Cash disbursed	26,840.50
Cash on hand	$10,619.00

Taxicab Service Begun in Chicago.

Chicago, part of it at any rate, taxicabbed Thursday morning last, when the first of the Thomas taxicabs was placed in operation by C. A. Coey. Fifty of the vehicles will be in operation shortly. According to advices from the Windy City Owen H. Fay also will start a taxicab business. Fay has ordered ten Elmore cabs built and will place taximeters on eight electric cars, starting with eighteen available vehicles. With Orlando Webber also about to engage in the business as well as a subsidary company of the New York Taxicab Company, Chicago apparently will not want for the modern vehicles.

New York Dealers Promote a Carnival.

At a meeting of the New York Automobile Trade Association held at Hotel Cumberland, New York, yesterday, attended by over fifty prominent members of the trade in New York, it was definitely decided to hold an automobile carnival during the week of April 6. One of the settled features is a parade on Tuesday, April 7, which will consist of four divisions. The first division will comprise cars constructed in 1903 and prior thereto; second division, gasolene, steam and electric cars owned by dealers, cars not to be decorated; third division, commercial vehicles.

Brass Bands to Boom Business.

About the time the buds begin to sprout the Chicago Automobile Trade Association is going hunting for business with brass bands. During the week beginning March 28th, the Windy City dealers will hold a "spring show" which will consist of the dealers holding "open house" along the "row," which will be gaily decorated for the occasion. Brass bands, decorated parades, luncheons, and all the other features of a carnival will be brought into play to boost spring business in Chicago.

Stratton Joins Studebaker Staff.

E. V. Stratton, for the past year manager of the New York Automobile Trade Association, has resigned that staff to engage with the New York branch of the Studebaker Automobile Co., He will be associated with C. F. Redden in the management.

Body Builders' Increase of Capital.

The C. R. Wilson Body Co., Detroit, has increased its capital stock from $75,000 to $250,000. The added money will be used in extending the business.

LEGAL VICTORY FOR RUSHMORE

His Right to Name and Descriptive Words Sustained by an Injunction—Saxon "Caught with the Goods."

The merry war in the automobile lamp business which was precipitated last spring over the questions of design in connection with the "flare front" and "Rushmore" types has found an echo in court, and the defendant lamp manufacturers who made and sold "Rushmore" lamps which were such in appearance only, seem to have been so thoroughly "caught with the goods" that they have been enjoined against their further manufacture and must give an accounting. In a decision in the United States Circuit Court for the Southern District of New York, Judge Ray takes Herman Saxon, of the Manhattan Lamp Works, of New York, severely to task for copying in detail the genuine Rushmore lamps and gives the complainant, Samuel W. Rushmore, of the Rushmore Dynamo Works, Plainfield, N. J., a sweeping injunction covering the use of the words "flare front" and "Rushmore."

Conspicuous among the exhibits during the trial of the case were receipts from the Manhattan Lamp Works covering the sale of "Rushmore" and "imitation Rushmore" lamps, together with lamps themselves made in imitation of the complaining manufacturer's product. Saxon appears to have readily fallen into the trap that was laid for him. In one case the receipt covered the sale of lamps to a purchaser during the Madison Square Garden automobile show, in January, 1907, while in another it represented an invoice of lamps to a western jobber.

Considerable stress was laid by the court on the fact that the design copying of the defendants was in some particulars so close and minute as to include defects and errors found in the original lamps, though in the main essentials of lens mirrors and brass stock the imitation lamps were quite different.

The judicial view as to the use of the words "flare front" in describing automobile lamps is of particular interest to the trade. After showing that while "flared front" and "flaring front" are ordinary and grammatical descriptions, the words "flare front" in combination, are unusual and ungrammatical, having been adopted by the complainant arbitrarily to coin a new and distinguishing mark for his lamps, Judge Ray says, "It is, of course, true that everyone is at liberty to use the ordinary descriptive words of the English language to describe goods of his own manufacture. But when one has designedly and abitrarily taken an unusual and an ungrammatical combination of two words, even if they do suggest an idea and a correct one of the construction and utility of the article of manufacture, and by long use of it has come to be so understood by the purchasers and users thereof, a competitor has no right to use it, for the purpose of deceit."

For this reason he grants a decree for the complainant, covering both the making and selling of the offending lamp shells and the use of the words "flare front."

The Week's Incorporations.

Newark, N. J.—Brush McLaren Motor Co., under New Jersey laws, with $50,000 capital; to manufacture and deal in automobiles. Corporators—Annie V. McLaren and John Stern.

Watertown, N. Y.—Warner Automobile Co., under New York laws, with $10,000 capital. Corporators—Charles D. Warner, Albert O. Warner and Edith Warner, all of Watertown.

Reading, Pa.—Reading Practical Automobile School, under partnership agreement, with $200 capital; to teach automobile operation and repairing. Copartners—Malcolm T. Newstetter and Lester E. Goenzle.

Newark, N. J.—New Jersey Automobile Exhibition Co., under New Jersey laws, with $5,000 capital; to promote automobile shows. Corporators—George Paddock, Angus Sinclair and James R. English.

East Moline, Ill.—Midland Motor Co., under Illinois laws, with $100,000 capital; to manufacture motors, automobiles, etc. Corporators—C. H. Pope, A. E. Montgomery, E. H. Guyer, C. E. White and William Butterworth.

St. Louis, Mo.—Universal Auto Spring Co., under Missouri laws, with $110,000 capital; to manufacture and deal in automobile springs and supplies. Corporators—Frank C. Koehler, Wm. Klasing, Henry Schwarting et al.

New York City, N. Y.—Automobile League, under New York laws, with $5,000 capital. Corporators—Frank J. Griffen, 116 Nassau street; Nicholas Fancher, 213 East 135th street; William T. Conville, 2493 Broadway, New York City.

Rochester, N. Y.—Rochester Motor Vehicle Co., The, under New York laws, with $10,000 capital; to sell motors, engines and accessories. Corporators—Fred C. Benson and Owen DeWitt, of Rochester; and Stephen H. Lusk, of Pittsford.

New York City, N. Y.—Columbia Lubricating Co., under New York laws, with $1,000 capital. Corporators—Avery McDougal, 176 West Eighty-seventh street; Ward W. Pickard, 60 Wall street; Morton G. Bogue, 52 Williams street, New York City.

New York City, N. Y.—Adams Repair Co., under New York laws, with $10,000 capital; to repair automobile parts, etc. Corporators—Clyde W. Adams, 457 West Fifty-seventh street; Claude L. Post, 605 West 141st street; Robert P. Kernan, 60 Wall street, New York City.

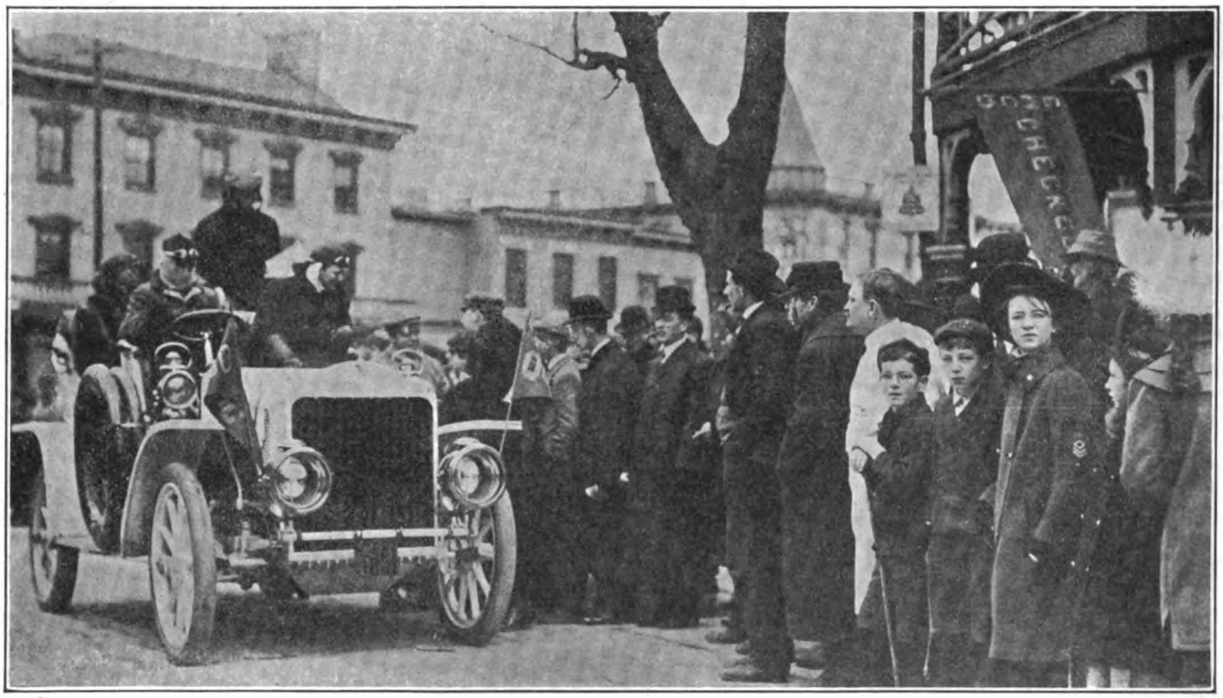
WRIDGEWAY WILL LESSEN GLARE

Secures Exclusive American Rights to Bleriot Light Shutter—Mayor's Message Opportune for Him.

Almost co-incident with the recommendation of the Mayor of New York that an ordinance be passed prohibiting the use of blinding headlights, Charles D. Wridgeway, himself a New York motorist of wide experience both on track and road, closed a contract for the exclusive American rights to the Bleriot light shutter or eclipsing device which seems to do away with the objectioable features which have caused complaint, while still permitting the use of brilliant headlights and giving to the driver all of their benefit and to the on-comer none of their disadvantages.

The Bleriot invention, which the Motor World illustrated at the time of its appearance abroad, is simplicity itself, resembling nothing so much as a miniature radiator of the horizontal stripe type. It is, in brief, a series of metal strips placed within the door of the lamp, so arranged that at a distance, there is no distinguishable difference between lamps so equipped and the regular type, but as one draws nearer the lamp the light becomes duled, and on passing reduces itself to about the same sized rays as those cast from an oil light turned down There is absolutely no reflection. The device, one of which Wridgeway has been demonstrating, must be seen in actual operation to be appreciated. In the meantime Mr. Wridgeway, thoroughly converted to its value, is preparing an aggressive campaign to place its merits before the motoring public at large.

Cincinnati Show Fading Away.



It is doubtful if the Cincinnati show, which was scheduled for the latter part of February, will be held. Following the last meeting of the Cincinnati Automobile Dealers' Association it was semi-officially announced that the show idea will be abandoned. The chief obstacle in the way is said to be the action of the insurance companies in demanding high rates, and while it is possible that this handicap may be removed, the general opinion is that it will not in time to make arrangements such as would be neeessary to make the show a success.

G & J Changes Boston Representative.

The Boston agency of the G & J Tire Co., at 204 Columbus avenue, has been discontinued and the Enterprise Rubber Co., of which William E. Barker is president and treasurer, has been appointed New England representative. D. B. Price and R. J. Barker, who have been connected with the G & J agency, will continue with the Enterprise Rubber Co.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

White Wins Quaker City Endurance Run

In the endurance run held January 1-2 by the Quaker City Motor Club, the White Steamer was the only car which made a perfect score on the road and also was declared by the Technical Committee to be in perfect condition at the finish. The Contest Committee would not abide by the decision of the Technical Committee. They gave credit for perfect scores to two other cars and ordered a "run-off."

The supplementary contest, held January 4th, served only to emphasize the superiority of the White. The examination then made by the Technical Committee placed the White far in the lead and, accordingly, the MacDonald & Campbell trophy was awarded to the White.

With our entry of but one car, we decisively defeated 27 gasoline cars representing 23 different makes. Thus has another important victory been added to the long list of triumphs achieved by the White—the distinctively American car.

Lifting of the Clouds.

During the period of financial unrest, which now is nearly dissipated, nothing has been at once so pitiful and so amusing as the efforts of the braver souls to convince themselves and others that "nothing had happened,"—that everything was rosehued and that the so-called depression was but a bad dream.

It serves no purpose to wail, or shed tears, or to spread gloom, but neither does that form of self-deception and rainbow-chasing effect any real end. It is like whistling to keep up courage. When a manufacturer cannot obtain accommodations from his bank, when his factory is operating on half time or no time at all, when a salesman cannot sell and when a man is out of employment, it is folly to try to convince him that "everything is lovely' and that "nothing has happened," or that the conditions to which he is subject are merely dreams or imaginings which may be routed by applications of faith or by cheerful whistling.

But now it may be said that the clouds are dissipating and that the sun again is shining through the rifts. Things are picking up all around. Factories are resuming their industry and salesmen are again selling automobiles. Cheerfulness is spreading and it is the real thing and not the mock article accompanied by doubtful smiles or qualifying whispers. The industry is resuming a normal tone, if not its normal tone, for its normal tone rather had been abnormal. Its pace had been too swift. Caution had been too largely thrown to the wind. There were too many who recked not of the morrow.

The disquieting flurry was not without its benefits. It taught some men the meaning of caution and conservatism and showed them the folly of attempting to rear ladders to the skies. If the chastening and house cleaning is not wholly completed, the trade at least can now go about the work of readjustment with renewed spirit and, as always, the fittest will survive.

Quicksand as a Foundation.

Some day it will filter through some heads —if not those that now are directing the organization, then their heirs or assigns— that the American Automobile Association "got in wrong" when its foundations were laid so largely on club memberships and not individual memberships.

The capital made of it by their enemies and the damaging publicity given to the recent withdrawal of the Massachusetts Automobile Club should assist the filtration process even in the present administration, of which, however, there is sign. Club memberships, which means accession of members in large blocks, enable the officials to quickly lengthen the roll and during a boom period they are obtained with comparative ease, but when a club drops, a hole is created and the dropping creates a noise that attracts undesirable attention. A succession of holes and a succession of noises do an awful lot of damage, whereas the dropping of one individual member or several hundred of them never would be heard and would excite no notice, and the voids created easily might be filled.

It is unfortunate, but it is true, that sooner or later a majority of clubs weary of paying large sums from their treasuries, or one man with a grievance often is able to persuade them that they are weary of it, and then begins the trouble and the downward slide of the national organization with which they are afflicted. It is logic. It is history. The effect of their indifference to the teachings of experience and to the individual member, which the Motor World several times has remarked, may not be felt during the terms of the present A. A. A. officials or of their immediate successors—they will be able to retire with the proud boast of a "large membership"—but on those who come after them will fall the difficult task of practically rebuilding the organization.

What has happened in Massachusetts will happen elsewhere; if not to-day, then to-morrow. It is practically inevitable. As a foundation, club membership is akin to quicksand.

Unbiased Test of "Sixes."

All partisan feelings aside, the question as to the relative suitability of four and six cylinder motors for popular usage should be regarded in a tentative way pending a decision which ultimately must be based on actual service at the hands of a large number of unbiased users. In most of the discussion which is taking place on this subject the fact is overlooked that even granted superior characteristics for the sextuple motor in certain respects, other and even uneconomical considerations may serve to render the quadruple type more useful in the majority of cases. The fact that several makers of repute have abandoned the four cylinder motor in favor of the six does not necessarily prove that the six is in every way superior any more than the expenditure of immense amounts of money in the construction and installation of quadruple expansion steam engines in ocean liners and large power plants at one time, proved the advantage of using four stages of expansion instead of three. As in the present case, each system has certain advantages over the other. But the final question of their relative utility cannot be answered until both have been given a fair trial under circumstances affording an absolute basis of comparison.

All this being so, it is extremely gratifying to discover a maker who is willing to acknowledge himself open to conviction in either direction, while doing his best to perfect both types, and while at the same time striving also to produce two motors which shall be equivalent in all respects save in the one particular of the number of

Digitized by Google

cylinders employed. It is not that the efficiency of the newer motor is in question, nor that its design offers problems of such a nature that they cannot be solved readily. It is not that the one, or two or four cylinder types of motor have outlived their usefulness. The whole matter hinges about the final acceptance or non-acceptance of the sextuple motor by the user as being, all things considered, best for his purposes. The maker who places himself in a position to test the "roadability" of each type on a thoroughly comparative basis, loses nothing by his conservatism in not advocating either to the exclusion of the other, and finally discovers himself able to cater to popular demand which ever way it swings.

It is noteworthy that the first official American road test of a car using benzol has taken place. This and all other attempts to develop newer and more economical grades of fuel than gasolene are praiseworthy and much to be encouraged. At the same time it is a pity that organized bodies, such as the engineers and some of the larger clubs, do not take a more lively interest in such tests and in addition to stimulating popular interest by organizing competitions and road trials, establish a well-organized system of laboratory investigation. Much of the alleged experimental work carried on in this country in connection with the automobile movement is of small consequence practically speaking because directed with too little regard for theoretical exactitude.

His friends who handed out the press notice meant well and the young man himself is not to blame, but they performed doubtful service when they heralded the recruit to the ranks as being "peculiarly qualified" for automobile work because of his having enjoyed a college engineering course and three months' service in the repair shop of a local garage. A college course and three months in a repair shop! It is calculated to make some men in the trade smile a very reminiscent smile.

Possibly if the promoters of the proposed Westchester road race had "showed down" a little earlier, they might not now be put to it to secure sufficient entries to prevent to project from falling through. The lack of entries indicates also that the trade was not crying so loudly for such an event as was made appear.

Rim Equipment of Taxicabs.

Editor of The Motor World:

Allow us to call your attention to a statement made in a recent issue of your paper entitled, "Success of the Taxicab Service."

You state that the New York Transportation Co.'s vehicles are equipped with Midgley rims to enable them to remove tires quickly for repairs.

Not a single New York Transportation Co.'s vehicle is equipped with Midgley rims, but on the other hand, 25 of these vehicles are equipped with the Goodyear universal rim, which the New York Transportation Co. will tell you has been found to be eminently satisfactory in every test they have given it. We might add to this that these Goodyear universal rims are equipped with Goodyear detachable tires which have averaged also 4,000 miles up to date, with repairs approximately $30 for the entire lot of 100 tires.

Inasmuch as you devoted considerable space to your very interesting article in connection with the taxicab service you will probably be willing to correct your statement as to the equipment of the New York Transportation Co. and further enlighten your readers regarding tires with the information we give you herein.

GOODYEAR TIRE & RUBBER CO.

[Upon being asked specifically concerning the rim equipment of his company's gasolene taxicabs, Secretary Palmer, of the New York Transportation Co., explained that in his earlier interview he had stated that the cabs were fitted with Midgley rims without investigating their manufacture but rather in the generic sense of detachable equipment. Investigation, however, discloses that the present rim equipment consists of 25 sets of Goodyear universal rims and 25 sets of Firestone universal rims.]

In the Retail World.

Stanley & White are building a garage in Church street, Whitman, Mass. Its dimensions are 40 by 70 feet.

The Westworth Motor Company has established a new agency at Euclid avenue and Mayfield road, Cleveland. The Ford and Mora cars will be carried.

Charles Hendy, Jr., who was formerly in the life insurance business in Denver, Colo., has set up in the automobile trade there at 1552-4 Broadway. He will handle the Ford.

P. C. Long is building a three story garage with a frontage of 63 feet at 207-209 West Ninety-eighth street, New York. The construction will be fireproof re-inforced concrete.

C. W. Risden, of Los Angeles, Cal., who has sold motorcycles to considerable advantage in California, has added automobiles. The Brush runabout is his acquisition.

The Nock Automobile Company opened its new and commodious garage in Providence, R. I., last week. It is located at 486-488 Broad street, where the Stoddard-Dayton will be exploited.

The Maxwell Company has opened an agency in Worcester, Mass., at 84 Mechanic street. It will be in charge of Melvin E. Dixon, although the establishment will be under the supervision of Lucius S. Tyler of the Boston office.

The Ohio Motor Car Co., Cleveland, moved into its new quarters in the Otis building on upper Euclid avenue, last week. The building has been entirely remodeled to make an up-to-date garage and sales rooms for the company.

The Worcester Motor Buggy Co., which has been formed at Worcester, Mass., to sell several lines of cars, has elected the following officers: President, W. J. Woods; secretary, Edward L. Caton, and treasurer, John P. Coughlin.

William Ehlers has purchased the interests of Joseph Seaman, who with Percy Duerr has handled the Maxwell in Davenport, Ia. The style of the new firm will be Ehlers & Duerr and a new garage will shortly be built on Fourth street.

The handsome new garage recently erected by the L. S. Gillette Company at Hennepin and Harmon place, Minneapolis, has been purchased outright by the Barclay Automobile Company, which occupied it. The consideration mentioned in the deed was $32,000.

Pittsburg has another automobile agency —the Pittsburg Automobile Co., which has located at Grant boulevard and Seventh avenue. The company, which will handle Thomas cars exclusively, this week is holding a show in the new salesrooms, in the nature of a house-warming.

COMING EVENTS

February 1-8, Providence, R. I.—Show in Providence State armory.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association show in Central armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

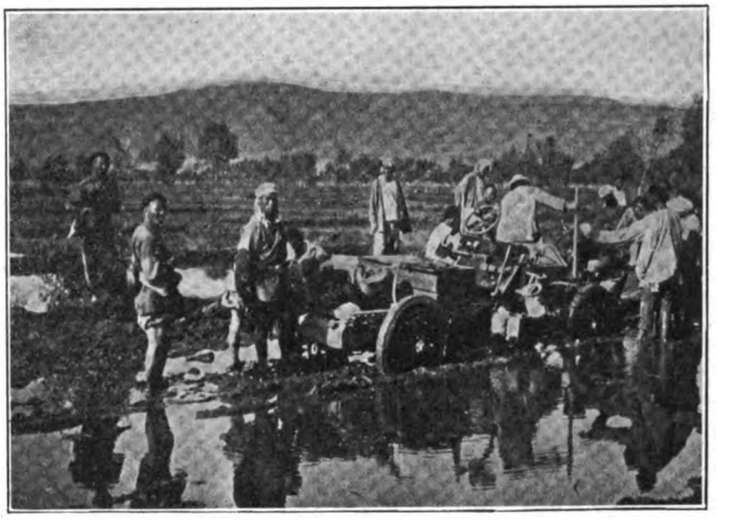
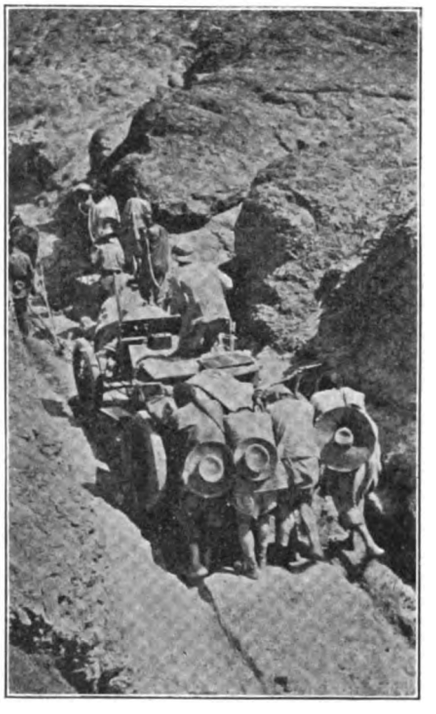
FRUITLESSNESS OF FREAK RACES

Wherein the Pekin-Paris Run Failed—What It Forecasts for the Proposed New York Paris Contest.



Effervescent but evanescent Parisian enthusiasm for the proposed New York to Paris "automobile race" has subsided to a sober consideration of its practicability and the more serious study that is given it, the more its probability dwindles, as a bona-fide undertaking. That as a race for automobiles unassisted by other power it is an impossibility, even granting the use of boats for Bering Strait and for ferrying the rivers, is becoming apparent, both by the growing information concerning the topography of the northern portions of the itinerary and the facts that are being elicited concerning the famous Pekin-Paris race which has been held up by its promoters as an evidence of the feasibility of the later project.

The very honesty and frankness of the record of that brave adventure, as told in his recently published book by Luigi Barzini, who accompanied Prince Borghese, shows it to have been a sincere and creditable enterprise on the part of the contestants, but the experiences of the latter nevertheless establish the fact that automobiles cannot accomplish the impossible and that in going from Pekin to Paris the machines were at times just like so much freight that had to be moved or transported Only a distorted conception can accept such features as anything but contrary to the usual understanding of what constitutes an "automobile" race, and certainly of no value as indicating the capabilities of the motor car.



During some 120 miles that the car of Prince Borghese was being pulled by mules and horses, or pushed and carried by coolies and laborers, Barzini had plenty of time to take pictures of the machine's plights. As shown in the accompanying illustrations, there were many times when progress was not dependent upon the power or virtues of the automobile itself but upon the available facilities in mules and men for moving heavy freight through certain districts. The trip made clear that where conditions were suitable the automobiles could run, and where the conditions were unsuitable, they could not. To propose a race where motor cars cannot go on their own power would open the way for a contest up Mt. Blanc or Mt. McKinley, where the winning car would be that preceded by the best mountain climbers to rig up the necessary tackle and windlasses to draw the machines bodily to the top.

HOW THEY WENT THROUGH, NOT OVER, A BRIDGE

HOW THEY DIDN'T PROPEL THROUGH BOGS

HOW THEY DIDN'T CLIMB HILLS

Compared with the so-called New York to Paris "race," the Pekin-Paris would be but a pleasant little excursion, and despite the gravity of Le Matin, the publication fathering the project, in describing the rigors of the journey, it is doubtful if it realizes what it asks the competitors to attempt. As showing, however, that it is not wholly insensible to the difficulties to be encountered in such an undertaking, Le Matin publishes great quantities of advice to the prospective contestants, relating to the best preparations for the trip. Regarding construction and equipment the promoters of the race have this to offer:

"A short chassis is preferable, one of 30 or 40 horsepower. The air intake of the carburetter should be supplied with a warmer. This warmer will thaw the air at the moment of starting and thus save time. This can be accomplished by affixing a thick tube to the air intake, this tube passing outside of the automobile and being adjusted to a lamp, so that it can be heated red hot. The air intake will thus be heated by conductibility. A special tap should be arranged so that the tube conducting fuel to the carburetter can be completely emptied, so that the motor can be heated by means of a little oil ignited in a metal plate under the motor.

"Spare rims and tires should be placed in the middle of the chassis above the reservoirs. Coffers for food supply, clothing and spare parts should be of such shape as to fit in between the spare rims and tires. The driver's seat should have as cushions the three sleeping bags. There should also be a special hood, furred outside and in, long enough to descend to the waist of the driver, who is being relieved so that he can sleep while his comrade continues the course. The third seat in the middle of the chassis should be left unoccupied and placed at the disposition of correspondents of the organizers, who will pass from one machine to the other in the course of the voyage. Immediately over the chassis there should be a series of at least five fuel tanks, each ca-

Digitized by Google

pable of holding as much as the usual large pressure tanks in current use.

"In San Francisco, in stores which make a specialty of such merchandise, will be found everything necessary for travelers going to Alaska. This equipment, for the most part, will be better than that which you could secure in Europe. The list includes a revolver and Winchester rifle, felt boots, rubber hip boots, moccasins, fur mittens, sheepskin sleeping sack, picks and shovels, white bear oil for greasing the face and body. Native dogs should be taken on at Valdez. From Europe should be taken yellow goggles with double lenses mounted in wood and bordered with fur or silk, the whole united in a fur mask covering the face; nine pairs of woolen stockings, superposable, so that three pairs can be worn at a time; heavy flannel shirts, boxes of preserves, a compass, silk tent, and Nansen stove.

"Wheels should have removable rims. For traveling on ice pneumatics should be replaced by metallic types supplied with steel creepers. For traveling on snow a wicker platform of six square metres, bordered with wooden runners, should be fixed under the machine. This will support an automobile of 2,000 kilogrammes. The wheels, in case of soft snow being met with, could be supplied with wide wooden rims of water wheel formation. This equipment could be in use only in certain portions of the United States. In Alaska it would be useless, as the snow there is frozen hard. All pneumatics should be vulcanized in order to resist the great cold."

Speakers for the A. C. A. Banquet.

That there will be a large attendance at the annual banquet of the Automobile Club of America on January 25 was assured long before the listing of reservations closed on the 15th inst. The banquet hall in the new club house has capacity for 361 covers, and it is probable that every place will be occupied. Incidentally the banquet will be a sort of christening of the new home of the club.

As a tribute to the claim of France to being the birth place of the modern motor car the French Ambassador, Jules Jusserand, will be the guest of honor. Among those who are to furnish the "flow of soul" on the occasion are Senator Chauncey M. Depew, Augustus Thomas, Job E. Hedges and Patrick Francis Murphy. The committee is composed of A. R. Shattuck, chairman; Dave H. Morris and O. A. Parker.

With good roads as its slogan the Youngstown (Ohio) Automobile Club was organized last week. The following officers will guide the new club's destiny: President, James A. Campbell; vice-president, John R. Squires; secrtary-treasurer, George L. Fordyce; trustees—J A. Campbel, John R. Squires, Dr. W. H. Buechner, C. A. Cochran, Dr. C. R. Clark, George E. Day and C. B. Klingensmith.

JERSEY CLUBS FRAMING NEW LAW

Twenty of Them in the Movement—Their Delegates Outline Important Amendments to the Frelinghuysen Act.

Representatives of twenty automobile clubs, comprising 2,700 members, met at Trenton, N. J., last Thursday, 9th inst., and thrashed out the question of probable automobile legislation in New Jersey during the present legislature. It was a special session of members of the Associated Automobile Clubs of New Jersey, and the discussion which followed the plan of action suggested at an informal meeting of representatives of the various clubs held in Newark, resulted in the decision to draft and have introduced amendments to the present Frelinghuysen law, which has been in operation for a year.

Radical changes in the Freylinghuysen law are asked. One of them is that automobilists registered in other States be allowed to tour in New Jersey for a period not exceeding ten days, and that all licenses shall expire on the 31st day of December; further, that license tags be furnished in uniform style by the State.

One of the most important things asked for is a law requiring all horse-drawn vehicles to display lights at night, which, if passed, doubtless will tend to lessen accidents resulting from non-observance of this. It is proposed also to make it a misdemeanor for an intoxicated person to drive an automobile; to make it a misdemeanor to throw glass, tacks or other tire destroying substances in the road; to require all license fees, and so forth, to be devoted to road repairing; to require all justices to report fines to State authorities, and to abolish personal registrations.

Summarized the amendments desired to the present law, and which will be presented to the legislature in session are as follows:

First—All horse-drawn vehicles to carry lights at night.

Second—Automobilists of foreign States to be given ten days' right to tour State without registering there.

Third—All licenses to run out December 31 of the year and tags to be furnished by the State.

Fourth—A higher fee for licenses to go to the highway commissioner for road repairs.

Fifth—Making it a misdemeanor for a drunken man to drive a machine, and for any one to throw glass or other brittle substance on the road.

Sixth—All fines must be reported to automobile inspector the day fine is imposed and all moneys from fines turned in within thirty days.

Seventh—Abolition of the personal registration idea, thus saving State about $30,000 for maintaining officers over State.

Buffalo's Shakedown Declared Illegal.

Buffalo's automobile tax ordinance received a knockout blow on Wednesday last, 8th inst., when the Appellate Division announced its decision in the locally famous Dai H. Lewis automobile tax test case. Judge Hodson's decision that the Buffalo automobile tax was contrary to the State law is upheld by the Appellate Division. It may be remembered that when the Buffalo automobile tax ordinance went into effect it was strongly opposed by the Automobile Club of Buffalo, and in order to make a test case Dai H. Lewis, secretary, offered himself as a martyr, and by refusing to pay his tax got himself arrested. He was prosecuted by the city in the Municipal court, and ex-Judge Kenefick, his attorney, made the plea that the local ordinance conflicted with the State act in that it resulted in a double tax. Hodson upheld this contention and the city appealed with the result that the Appellate Division has upheld the decision, resulting in a victory for the automobile club.

Another Tangle Under Bay State Law.

The latest disputed interpretation of the Massachusets State law relating to automobiles is likely to develop some fine legal hair splitting when the resultant appeal case is argued. Charles E. Whitten, of Lynn, was fined $15 by Judge Lummus in the local police court for operating an automobile without proper registration numbers on the side lamps. Whitten, who conducted his own case, contended that the car was registered in Pennsylvania, where the law does not require the rear or side light numbers; furthermore, he contended, he had the right under the Massachusetts law to operate a non-resident car seven days after bringing it into the State before making registration in Massachusetts. Judge Lummus ruled that the seven days of grace apply only to a non-resident car driven by a non-resident owner, and accordingly adjudged Whitten guilty and imposed a fine of $15, as stated above. An appeal was taken.

American Consuls not Immune Here.

Magistrate Steinert, a New York justice, decided last Friday, 10th inst., that only consuls in the employ of foreign governments are immune from the speed laws, when he held Caldwell S. Johnson, of New Haven, who is connected with the United States Consular Service, in $100 bail in the Morrisiana police court for trial in Special Sessions on the charge of speeding in his automobile. Johnson had protested at his arrest in Pelham Parkway, exhibiting official papers and asserting that he was on his way to Washington to keep an appointment with President Roosevelt. His excuse did not go with the magistrate, however.

"SIX" AND "FOUR" IN LONG TEST

Apperson Operating Both Types in Competitive Tryout Under Even Conditions—Relative Advantages.

A frank and decidedly novel turn is given to the much-discussed question of the relative suitability of four and six cylinder motors for popular use, by the open avowal of the Apperson Brothers Automobile Co., that with the best possible means of study and comparison at hand, their engineers have as yet been able to arrive at any definite conclusion as to which is the better of the two. For some little time two types of motor have been built, one a four and the other a six, which have about the same aggregate piston area and are otherwise similar, and may be used in the same chassis. A close observation of the performances of these two types is now being made with the idea of finally determining which is the better for general work.

It is frequently the case that six cylinder motors are made by merely extending the construction of an established quadruple design by adding two more cylinders to it. Comparisons drawn between the old and the new in such a case are manifestly unfair, even when nominal allowances are made for the difference in power. In building two motors of essentially the same power and weight, however, and fitting them into the same chassis, the Apperson brothers have placed themselves in a position to obtain the most truthful and extensive data which it is possible to gather, since the results so derived will be from practical use quite as much as from laboratory study and theoretical calculations alone.

"We believe that 'the proof of the pudding is in the eating.' We believe that both the 'six' and the 'four' each have advantages not possessed by the other, and it is our purpose and intent to find out, if possible, which of the two possesses the greater advantages, including power, speed, life of motor, cost of maintenance, and repairs," remarks Sales Manager Strout, of the Apperson company, in this connection. "Some factories have turned out four cylinder motors that have not been practically successful and it might be 'good business' for them to jump into the six cylinder field, for a while at least. But it is not fair to compare the showing of any 'six' against the showing of a 'four' that has not been entirely successful and satisfactory.

"For some years we have been building a four cylinder automobile motor, with cylinders of 5½-inch bore and 5-inch stroke that has been entirely successful and satisfactory to all concerned. The total piston area of this four cylinder motor is 95.0334 cubic inches. Many months since we designed and built a six cylinder motor with 4½-inch bore, and 5-inch stroke, total piston area, 95.4261 cubic inches. It will be noted that the total piston area of this six-cylinder motor is only .3927 of a cubic inch greater than the total piston area of our four cylinder motor. The six cylinder engine weighs approximately 75 pounds more than the four cylinder engine, and occupies only 2½ inches more space under the hood. Both engines go into the identically same chassis, and barring the small additional weight of the 'six' engine itself they must propel the same number of pounds of chassis and body.

"In our case, we now have a four cylinder car, and a six cylinder car, of the same weights, with the same carrying capacity, operated by the same drivers under the same conditions. We have been driving our 'six' in competition with our 'four' only four or five months, and so we cannot yet arrive at accurate conclusions. We believe, as stated above, that each type has advantages over the other type, but right now, although we are building and delivering both 'sixes' and 'fours,' we are under the impression that the disadvantages of the 'six,' as contrasted with the 'four," outweigh its advantages. But we cannot yet make a definite decision and statement, based on our experiments and experience, that we would be willing to 'stand on' as final. At the end of the present season we will be in a position to know positively the relative cost of maintenance, of repairs, and of efficiency of the two types of engines, when they have the same piston area, and when they are operated under the same weights and conditions."

New Type of Sheet Metal.

"Alumaloyd" is one of those terms which tells a great deal in a very few letters. It signifies a special analysis metal sheet coated with aluminum-alloyed metal which by the treatment afforded it is absorbed, not spread over the surface, and thus serves the purpose of a thorough protection to the base metal as well as a surfacer. The Stark Rolling Mill Co., Canton, O., which has been producing Alumaloyd for some little time, is now making a specialty of supplying it to the automobile trade. For this purpose it is particularly suitable as used in the construction of bodies, dashes, guards, bonnets, battery-boxes, drip pans, mufflers and the other purposes to which sheet metal may be devoted, particularly where it is desirable to retain a good degree of finish in spite of adverse conditions. Because of its ready-to-use quality it is an economical stock to carry, no finishing being required before painting, while it also may be used to advantage for die-work. According to the makers, it can be stamped, pressed, drawn, double-seamed or soldered—all without affecting the quality or value of the surface. Almost as a matter of course, it is produced in a wide variety of sizes and gauges adapted to the many uses for which it may be required.

HARTFORD PROUD OF HER SHOW

Annual Exhibition Opened Brilliantly and is a Beautiful One—List of the Exhibitors and Cars Staged.

Hartford had reason to feel real proud on Tuesday night, 14th inst., for the annual show of the Hartford Automobile Dealers' Association opened in Foot Guard Armory in a veritable blaze of glory "The Big Show," as the promoters termed it, has been the topic of conversation in Hartford for weeks, so it is little wonder that a large crowd of first-nighters visited the armory when the doors were opened at 8 o'clock Tuesday evening.

"The New York show in miniature"—that's what the Hartford dealers like to call their annual exhibition, and in justification of this assertion they point with pride to the fact that the uniformed attendants scintillate in the same resplendent regalia that enfolded the attendants at the Madison Square Garden show, from the red military caps and coats, and white riding breeches to the black leather puttees. And if further proof of the semblance of Hartford's show to the last one in Manhattan is needed, they will tell you of "Society Night," Thursday, when the price of admission will be doubled and the tickets "limited" to 1,000 of the elite, although, as one of the promoters said to a Motor World man some time ago: "If fifty thousand people come on Society Night they can get in, for we wouldn't want to rob them of the chance of their lives."

In a decorative sense the promoters have "spread themselves," and the interior of the armory really presents a beautiful picture The general color scheme is green and white, and a great canopy in this conceals the ceiling, while the side walls are prettily covered by delicately tinted fabrics. The feature is the arbor in which the band is hidden. It is in the form of a bower, located on the uprights 14 feet above the heads of the spectators. Radiating from this flowered bower are long streamers of wires covered with smilax and studded with thousands of incandescent lights. The wires droop gracefully to the side walls and give a Christmassy effect to the whole.

Every inch of space is occupied, including the basement and balconies. The cars are shown for the most part by local representatives, the complete list of exhibitors being as follows:

Main Hall.

Electric Vehicle Co., Columbia gasolene and electric cars; The Miner Garage, Pierce, Buick and Knox; R. D. and C. O Britton, Maxwell; Capitol Auto Hack & Livery Co, Mitchell; Palace Automobile Co., Autocar, Thomas and Oldsmobile; L. D. Fisk, Corbin; Connecticut Steel & Wire Co., Reo;

Digitized by Google

Elmer Auto Co., Ford and Rambler; Brown, Thompson & So., Packard, Stevens-Duryea and Cadillac; Robert Ashwell, Franklin; T. Dudley Riggs, Isotta Fraschini and Simplex.

Balcony.

Jones Speedometer Co., Jones Speedometers, etc.; Barton, tires; Post & Lester, sundries; The Aetna Life, automobile insurance; Travelers' Insurance Co, insurance; Visor Knitting Co., clothing; G. W. Fuller Co., trunk racks, trunks, etc.; New England Automobile School, tuition; Lombardi Speedometer Co., speedometers; A. L. Foster & Co., clothing; W. H. Wiley & Son Co, leggins, tire covers, etc.; Vacuum Oil Co., lubricants.

Basement.

A. L E. Rhodes, automobile washers; Harriman Motor Works, motors; Auto Body & Top Mfg. Co., bodies and tops; Atlas Motor Co., Atlas trucks; Lighting Specialty Co., specialties; G. A. Snow, motorcycles.

Chicago Schedules Three Events.

A 1,200 miles reliability run, covering four days, will be the star feature of the 1908 card of the Chicago Motor Club. This decision was reached at a meeting held last Friday, 10th inst. The dates selected are June 24, 25, 26 and 27, and the run will require a car to do 300 miles each day, which should make it the most strenuous endurance run ever promoted in America. The desire for earlier dates for its contests was manifested at the meeting. The Algonquin hill climb was set for May 15th, three months earlier than usual, and the annual economy run was booked for August 14th instead of in September. The contest committee also discussed holding a reliability test for high-wheeled motor buggies, but no definite decision was arrived at.

The Blanket Insurance of Automobiles.

Among new legislation affecting insurance recommended to the Massachusetts legislature by its joint special committee on insurance is a provision to enable persons having insurable interests in antomobiles to obtain insurance under one policy against the risk of property damage from all the hazards encountered in their use, this policy to be issued under the inland navigation and transportation form of policy. This recommendation aims to have incorporated in the laws authority for a practice already permitted by the Attorney General of the Commonwealth, as was stated in a recess hearing before the special committee late last summer, reported in the Motor World at that time.

Grand Rapids Chauffeurs Organize.

Employed drivers of private automobiles in Grand Rapids, Mich, have formed the Grand Rapids Chauffeurs' Association with these officers: President, Jacob S. Baker; secretary, P. A. Donaldson; treasurer, W. M. Andrews.

MORRELL AND MOORE EXPLAIN

Chief Sponsors of Westchester Road Race Disclose "What's What"—Must Have 25 Entries or no Race.

If there are not 25 entries in hand by February 1st, there will be no race for stock cars on the roads of Westchester county on April 24th.

This statement comes directly from Robert Lee Morrell, Esq.—he is a lawyer—who is chairman of the Automobile Manufacturers' Committee, which has the project in hand.

The entry list was to have closed on Wednesday last but as but 13 were then in hand, the date has been extended in order to give the hesitants more time in which to decide whether such a race is worth $1,000 to each of them. Of the 13 entrants in hand six are foreign cars, and of the others three are entered by the Cleveland concern which has been most anxious for the contest.

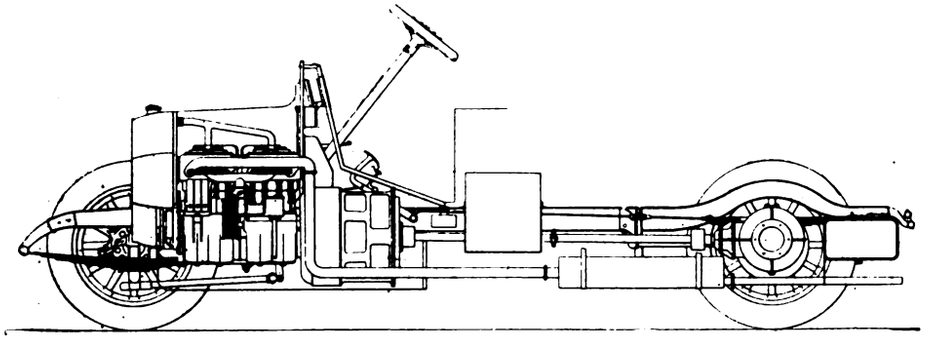
Mr. Morrell's statement followed a period of excited wrath, for the Motor World's suggestion that it were time for a showdown considerably aroused the gentleman. It induced the chairman to call a meeting of the committee, at which he read the Motor World's editorial with due emphasis, and while Morrell did not say so in as many words, he intimated quite generously that he would be made very happy if none of those present would advertise in this publication. But the editorial effected its purpose and a complete showdown resulted. While Morrell explained his position to one Motor World man, Thomas F. Moore, the secretary of the committee, produced letters and records that prove that Morrell and Moore do not constitute "the whole thing," as everything seemed to indicate, practically no other names having been permitted to see the light. It develops that the Automobile Manufacturers' Committee is made up of the following tradesmen, all of whom either verbally or by letter authorized the use of their names: Benj. Briscoe, C. A. Singer, Charles Schmidt, E. R. Hollander, Henry Ford, H. A. Lozier, Fred P. Brand, Andre Massenat, Hayden Eames, F. B. Stearns, Walter Allen, Paul Lacroix, A. H. Whiting, James Joyce, Percy Owen, W. H. Hurlburt, G. C. Johns, A. W. Church, A. L. Riker, E. T. Birdsall, H. C. Maxwell, Alden McMurtrie, G. S. Weidley.

In addition, there is an "advisory board" made up of newspaper men.

As for the fixed responsibility which the Motor World insisted should be made clear and which was the vital point in issue, one of the gentlemen concerned stated that the mere fact that the committee was not a closely knit or incorporated body made every one connected with it individually responsible, which he held was the best sort of responsibility. Mr. Morrell, however, placed the matter in a different light. He guessed that as he is worth about a million dollars his responsibility could not be questioned, but as a better safeguard he said it is the intention to take out an indemnifying bond to the amount of $100,000 which it is believed will be amply sufficient for all purposes and which will protect every one connected with the race except the entrants. In signing the entry blank the latter absolve the promoters and agree to bear their own burdens.

All of those concerned prefer that the so-called Metropolitan Automobile Association, which first undertook the road race for stock cars, be passed over with the fewest possible words. Moore, who "organized" it merely by printing a letterhead, now frankly admits all that the Motor World said regarding it was true—that as an association it was without shadow or substance, and was a mere "frame-up" for the purpose of promoting a hill climbing contest for the exploitation of a certain car. Mr. Moore laughs in his good natured way at mention of the "reorganization" of the "association," which was duly recorded by several members of the "advisory committee." In the "reorganization" it was stated that Mr. Morrell had become "chairman of the executive committee" and Job E. Hedges, "chairman of the legislative committee." Its disappearance almost immediately thereafter and the sudden creation of the Automobile Manufacturers Committee served to throw a suspicious mystery around the whole road race project. Moore states that he has been voted a salary of $50 per week, none of which has he drawn, and that all accounts are to be audited by a sub-committee. If any surplus remains the actual starters in the race will have their entry fees rebated up to $500 each.

In talking of his Metropolitan Automobile Association, Moore tells a good story of his abortive effort to secure a course on Long Island for the road race. It appears that another New Yorker became possessed of the same ambition and had arranged to meet the supervisors of Nassau county in order to obtain the necessary permission. Moore heard of it after the other fellow had departed for Long Island, and procuring an automobile he went posthaste to Mineola. Although the rival promoter had a long start, his car went wrong en route and Moore reached the supervisors and told his story first.



He also relates a laughable incident that attended his efforts to secure the course in Westchester county. In one place the farmers were obstinate because they feared the race would interfere with the delivery of their milk supply on the morning of the contest. Moore solved the problem by agreeing to pay fifty cents for each can of milk that might remain undelivered. It goes almost without saying that the farmers' obstinacy immediately melted.

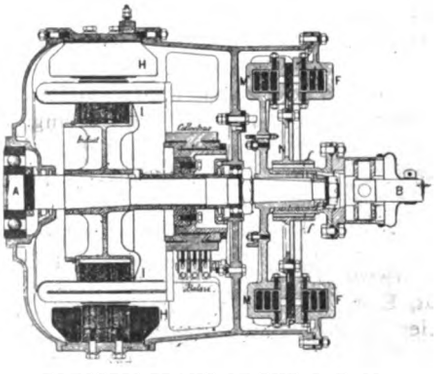
CLUTCH AND BRAKE POWER EQUAL

Transmission Features of a New French Gasolene-Electric Car—Wonderful Simplicity of the Control.

Though comparatively slow in development, and even yet but little known in a practical way, there are nevertheless many reasons to believe that the combination gasolene-electric vehicle, or in other words, the gasolene car with an electric transmission will eventually become the most familiar and acceptable in popular useage. Theoretically it possesses many advantages impossible of attainment with the purely mechanical transmission and even though tremendously expensive in cost of development, it is reasonable to suppose that once brought to a moderate degree of perfection it may be produced at a cost which is inconsequential, all things considered. Europe is doing much more in this direction at the present time than is America. One of the neatest and most pleasing designs yet produced, judging solely by its specifications, is the new G. E. M. car, which has just been introduced by the Société General d'Automobiles Electro-Magnetic.



CHASSIS OF THE G. E. M. GASOLENE ELECTRIC CAR

In principle the transmission of this vehicle comprehends the use of a direct-connected generator, magnetic clutch and clutch brake all enclosed within a single casing, and operated in conjunction with a 24-cell accumulator which is in parallel connection with the main line so that it serves the purpose of an equalizer and may be used for starting the engine, assisting it when operating under heavy loads, and is also subject to charge in the intervals when the drag on the clutch is relieved. The control of the car is marvelously simple, consisting of two hand levers mounted above the steering wheel, and two pedals. Of the former, one is used for starting and reversing, the speed changes being brought about by the movement of the other. Of the two pedals, one serves to apply the clutch or the magnetic brake as the case may be, while the other applies a pair of internal brakes on the rear wheels in the ordinary way.

The general layout of the vehicle is perfectly ordinary and modern. As will be seen from the accompanying illustration, the arrangement of the motor and transmission in the pressed steel chassis, as well as the suspension and axle mounting follow closely the lines of the ordinary touring car of moderate power and weight. The motor, which is of the four cylinder vertical pattern, has cylinders of 3 15-16 by 4¾ inches bore and stroke, and is rated at 20 horsepower at the normal speed of 1,400 revolutions per minute, though its maximum output is probably nearer 25 horsepower. It has interchangeable, mechanically actuated valves, drop forged steel connecting rods, light pistons and crank shaft mounted on three large ball bearings. Ignition is by high tension magneto, the ground switch being under the control of the master controller on the steering column.

It is governed automatically, this feature being the unique element of the carburetter which otherwise is of normal construction. The throttle, instead of being actuated in the ordinary fashion, is governed by a soft iron core which is retained by a spring and plunges into a double-wound solenoid under the influence of its magnetic attraction. One of the two windings of the solenoid, which is of fine wire, is connected in shunt with the main current line. The other, which is of heavy wire is in series with the ground of the battery current. The plunger is thus affected by a differential action in the two windings and is extremely sensitive to current conditions in the system. The action of the solenoid and so of the motor, is to equalize the action of the battery and dynamo currents as far as possible.

ELECTRIC PLANT OF THE G. E. M.

The chief organ of the electrical equipment consists of the dynamo which is of the 8-pole, shunt-wound type, as shown in the accompanying section. From this it will be seen that the field, H-H, consists of a magnetic iron spider centered in an aluminum frame which is bolted directly to the crank case of the engine. The armature, I, is keyed directly to the crank shaft, A, and is built up on laminations in the ordinary way. Three pairs of brushes are used, the brush holder being mounted in such a way as to be readily accessible for the replacement of the brushes. The maximum output of the machine is something like 200 amperes at 48 volts, or nearly 10 K. W., its normal output, however, averaging nearer 7, or between 9 and 10 electrical horsepower.

The arrangement of the clutch and brake are exactly similar, both acting on the same clutch disc and in the same fashion. Hence the braking power is exactly equal to the clutching power and may be controlled in the same way. The rotating field of the clutch, M, comprises an annular ring carrying a number of coils which receive current through a pair of collector brushes. The clutch disc, P, is suitably mounted in the casing to revolve independently of the crank shaft, and is connected with the differential through the ordinary form of cardan shaft, B. The field coils of the brake are similarly mounted, but are fixed to the frame of the transmission, as shown at F. Thus the magnetic drag exerted on the clutch disc whenever current is sent through the adjacent coils may be directed to causing the disc to turn with the revolving field of the clutch, or to retarding its motion according to whether the current is sent through the moving or stationary coils.

The control system has been outlined already. To start the machine it is necessary only to place the starting switch in the first position, when the battery current will be directed through the dynamo thereby setting it and the crank shaft in motion. A further movement of the starting lever serves to accelerate the group, at the same time cutting in the magneto and igniting the gas in the cylinders, the throttle being held open as a result of the current distribution. The controlling pedal being released from its midway position, the current is then directed into the clutch thus starting the machine, when the speed may be controlled by varying the strength of current in the dynamo fields. Similarly by depressing the pedal to its full extent, the current is switched over into the brake, when the retarding power becomes as strong as that of the clutch. For reversing, the starting switch is thrown over into its other extreme position when the battery alone is used for the time being. The clutch and brake functions act in exactly the same way under these conditions as for forward motion.

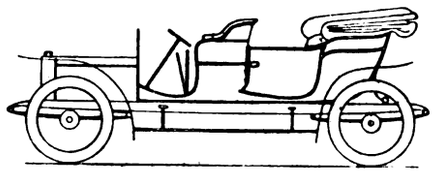
FLY WHEEL'S GYROSCOPIC ACTION

Possible Effects on Ultimate Behavior of Cars Described by an Observer—Some Other Possible Explanations.

A subject from which the non-technical reader has been happily relieved for some little time is that of the effect of the possible or probable gyroscopic action of the fly wheels of the motor on the life and action of the car. This matter at one time troubled motor engineers not a little, but was finally laid aside with the conclusion that whatever might be the gyroscopic effect it was not of sufficient importance to necessitate allowances being made for it in the design of the vehicle A thorough revival of the discussion is now threatened, however, by a communication recently published in an exchange, in which the writer claims to have observed a marked difference in the behavior of cars having right and left turning engines.

"I have noticed that the springs of a car driven by a right-hand revolving engine either touch the frame on the right-hand side or allow the tires to touch the wings on the right side, this usually taking place after the car has been driven some time and when well loaded, and driven over rough roads. The reverse is the case with a car which is driven by a left-hand revolving engine. The springs and tires then, under similar circumstances, commence to touch on the left side," is his startling observation.

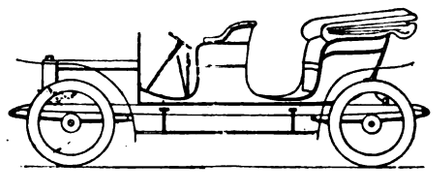
"I have never required to strengthen or assist the springs of a left-hand revolving engined car, as, owing to my experience, such cars are or were all of low power, and the touching was slight I have often had to strengthen or assist the springs of various right-hand revolving engined cars. I have also had an occasional fracture of a leaf or two, taking place on right-hand revolving engined cars, all on right or off side, left-hand revolving cars excepted, all being low-powered, springs giving no trouble. I have also been unlucky enough to bend and fracture a few axles, all taking place on the right side of right-hand revolving engined cars, left-hand revolving cars again excepted, being low-powered.



"I have noticed that the off side spring bolts and shackles on right-hand revolving cars show far more wear than their opposite neighbors. The reverse is again the case with left-hand revolving cars.

"I have often driven abroad, where the right-hand side of the road holds sway I still notice that right-hand revolving cars are weak on off side. . . . . The springs of a car driven by an engine whose fly wheel runs parallel to the road wheels never behave in any way out of the ordinary."

Some of the possible explanations suggested in accounting for these phenomena are: habitual running on one side of the road cambre, the constant weight of the driver on one side, regardless of the state of the load in other respects; the unequal thrusts, due to the piston impulses, and the pull of the steering gear. "All this might be applicable to right-hand revolving engined cars, but what about the left-hand cars?" he concludes. "I am inclined to think the root of the matter lies in the relation to the gyroscopic action of the fly wheel of the engine being conveyed to the springs and axles of the car."



Victoria Body of Convertible Type.

During the last year or two the trend in the direction of the surrey and victoria types of body has been extremely marked, but never more so than at the present time when, both in the more luxurious of the open town cars, and in the lighter forms of open runabout of the two seated va-

riety, the spirit of these designs is constantly reappearing. While of great utility in some respects, and lending itself well to ornamental design, the open-sided body possesses considerable disadvantage when it comes to long distance running over country roads—due to the effects of dust, mud and wind. For the light touring runabout, this effect may be overcome in part by the use of rather high, straight sides. But for the victoria town carriage this is manifestly impossible, and consequently, that vehicle in its most attractive form is not wholly adaptable for touring or country use.

In keeping with the development of the convertible idea which also has seen no

small amount of development within a short time, a London garage proprietor has designed the body here outlined, which is intended to be equally suitable for city and country running, but which in its former capacity, carries all the elegance of the true victoria. To this end a set of removable doors are used which may be readily attached when required, thus giving to the car the appearance of the regular touring vehicle, and affording the occupants all the protection which the high sides of that type provide. When required for city use alone, on the other hand, the doors may be removed, leaving the open victoria, as seen in the second illustration, which in ease of access and general air of comfort and luxury probably is unsurpassed by any other type imaginable.

ABSORBENT OF SOUND IN THE HOOD

Suggestions for Supplementing the Effect of the Muffler—MeMthods for Making Hood Linings Fireproof.

While the advantages of properly silencing the noises of the motor are universally appreciated, it is generally believed that when a proper muffler is in use nothing further can be done to quiet a well designed machine. It is unquestionable, however, that the remarkably quiet performance of many of the more expensive automobiles arises not so much from any special provisions in the motor mechanism to silence the rattle of metallic parts as to the close construction of the hood. In this connection, it is noteworthy that in many other cases the hood acts as a sort of sounding board in accentuating the noise of the motor to an unpleasant degree.

Muffling the motor in this way, while done in effect on several machines which have tightly closing hoods, might be carried to a still further and more effectual degree by lining the hood with felt or some other sound absorbing material which could be suitably fire-proofed if required, and secured by means of a special heat-proof cement. It is probable that an asbestos lining would prove somewhat beneficial in this way, but there can be no question that a layer of thick felt would produce more satisfactory results.

In this connection, the Scientific American is responsible for the following method of compounding a cement for this purpose:

"Take 16 parts gutta percha, 4 parts cauotchouc, 2 parts pitch, 1 part shellac, 2 parts linseed oil. Heat the first until liquid and add the others in order, stirring thoroughly. Good glue, to which tannin has been added until the glue becomes ropy, is also useful for this purpose and cheaper, but will not stand so high a degree of heat; it is fairly secure up to 150 degrees F. Adding quick lime to ordinary glue will render the glue fireproof, but it will not sufficiently permeate the felt to fireproof the latter. The felt had better be soaked first in a solution of the following proportions: Boracic acid, 6 parts; sal ammoniac, 15 parts; borax (pure), 3 parts; water, 100 parts."

When for any reason a spark plug manifests a tendency to stick when it is desired to remove it, a good plan is to smear the threads with a paste made by rubbing into a small quantity of Albany grease as much flake graphite as it will hold. When the motor heats up the grease, of course, runs away, leaving behind it in the interstices of the thread, a thin coating of the graphite, which acts as a lubricant when it is desired to remove the plug, and secures its easy removal.

EVILS OF SLIPPING THE CLUTCH

How They Affect the Multiple Disc Type—What is Gained by Increase of Clutch Surface.

Although multiple disc clutches are commonly advertised by the makers who use them as being adapted to withstand successfully an almost unlimited amount of slip the fact remains that clutch slip is not beneficial to any device of the sort at present in use, since any relative motion between the driving and driven parts is at the expense of a certain amount of friction of motion. Friction between moving parts always implies the generation of heat and abrasion to a greater or less degree, and it is a dubious fact that the clutch which is designed to slip seldom proves able to hold with any degree of certainty when a heavy load is applied.

In a general way the evils of slipping the clutch apply equally well to the disc and cone types. Much slipping grinds the surfaces together in such a way as to reduce the co-efficient of friction between them so preventing them from holding when required to do so. By increasing the amount of working surface in the clutch, as is done in the disc system, it is possible to increase the total amount of slip possible before destructive abrasion commences, and to do so to a remarkable degree. But the evil results of slipping are bound to remain after that limit has been passed, and to be just as important in their effects.

Two important points are gained by increasing the surface. First, the unit pressure on each infinitessimal area of clutch surface is reduced, thus reducing the tendency to abrasion without diminishing the holding power of the device as a whole. Second, the increase in surface also permits of more rapid cooling owing to conduction and radiation combined, as a result of which, the working temperature of the clutch is kept low and the tendency to abrasion counteracted in another way.

In this way the multiple disc clutch offers no new solution of the clutch problem, but merely an improved form of the old and familiar one. Its advantages are that with careful handling, such as might get good results from a clutch of almost any sort, it will last much longer and continue to give satisfactory results much longer than the plain cone type. When subjected to abuse, however, it is bound to give out, and though not apt to "set" as at present built, it is liable to abrasion to such a degree that a renewal of the surfaces will be required.

Such a renewal may be brought about by removing all the discs, grinding them down until a perfectly clean and uniform surface is presented, and reassembling the device taking care to readjust it both in spring and pedal or lever connections to compensate for the metal which has been removed and the consequent reduction in over-all length. As this is work which should properly be done on a suitable grinding machine, and involves considerable labor, it will be seen that the effects of careless handling are in the main more expensive than those involved in the maltreatment of the plain leather-faced cone clutch. The only requirement of that trustworthy arrangement is for a new stip of leather, which may be cut out and inserted by any mechanic with a fairly good degree of success.

It will be seen that though more expensive to build and more expensive to renew or repair, the greater life of the disc type affords a strong recommendation for it, especially as it will stand a greater amount of abuse without giving way than the older form, all things considered. By using good oil, however, and taking care to renew the supply at not infrequent intervals, washing all residue out of the case at the same time, the careful user will seldom if ever have to resort to any more strenuous measures of repair than an occasional polishing off of the plates and readjustments of the mechanism. It is even more important that it receive proper attention than is the case with the cone clutch.

Hillhouse Customs Fight Goes on.

In the hard fought case of J. T. B. Hillhouse, involving the question whether the owner of an automobile of foreign manufacture can be required to pay duty on the car a second time when he has kept it abroad a year and had it extensively repaired, a petition for a writ of certiorari has been presented to the Supreme Court of the United States by the Attorney General. The United States Circuit Court of Appeals for the Second Circuit held that duty could be collected only on the new part of the machine, but the government contends that it should be paid on the entire car. The case has been a long drawn out one and it was thought had been settled until notice of the action of the Attorney General was sent out from Washington last week.

Burglar Alarm for the Garage.

Along with the motor thief and the burgler who motors, comes the burgler of motor garages and their contents, who is becoming so much of a menace in England, as to have attracted the attention of the eager-eyed accessory maker. One of these enterprising individuals has recently perfected a special form of burglar alarm which consists of a whistle operated by compressed gas contained in a suitable tank. As installed in the private garage of the rural owner the apparatus is capable of giving an alarm which can be heard for a distance of several miles and one which, all things considered, is held to be more certain than the average electric bell combination.

COMMERCIAL VEHICLE TEST RULES

Program for the Coming Contest in France —Formula to Determine the Final Standing of Contestants.

The chief rules that will govern this year's commercial vehicle contest have been made public by the Automobile Club of France. There are to be eight classes, viz.: 1, vehicles carrying 50 to 200 kilogs. useful load; 2, vehicles carrying 201 to 900 kilogs. useful load; 3, vehicles carrying 901 to 1,500 kilogs. useful load; 4, vehicles carrying 1,501 to 2,000 kilogs. useful load; 5, vehicles carrying 2,001 to 3,000 kilogs. useful load; 6, vehicles carrying over 3,000 kilogs. useful load; 7, public service vehicles, 6 to 10 passengers; 8, public service vehicles over 10 passengers. No vehicle must weigh more, fully laden, than 4 tons per axle, the weight being arrived at by dividing the total weight by the number of axles.

The trial will comprise about 25 stages. Each stage will be divided into a number of sections. The average maximum speed, which must not under any conditions be exceeded in any single section, is fixed at 25 k.p.h. for all classes.

The final standing will be arrived at under the following formula:

$$\frac{T \times C}{P \times D}$$

, in which T represents time in hours; C the fuel consumption through the trial in francs; P the useful charge carried, to which will be added the weight of the vehicle body in kilogs.; D the distance covered in kiloms.

No speed above 20 kilometres per hour for Classes 1, 2, 3, 7, and 8, and of 15 kilometres per hour for Classes 4, 5, and 6, will be taken into consideration.

In regard to repairs, this section is divided into three categories, viz., (1) spare parts which can be changed at will; (2) stamped parts which must not be replaced except by duplicate parts officially stamped, of which each competitor may carry a certain limited quantity under the rules; (3) all other parts of the vehicle, not included in the above two categories, which may not under any pretext whatsoever be changed. The employment of pneumatics is forbidden, and no tire shod with rubber, or parts of elastic wheels, will be allowed to be replaced.

Neighbors Fight Against a Garage.

After Everett Mehrer had been stopped by the Building Department in his work of erecting a $4,000 garage at Chelsea, N. J., he secured a permit for a building 49x100 feet. Chelsea is a fashionable residential section at Atlantic City,, and there promises to be a pretty legal fight over the garage, as the Chelsea Protective League has determined to balk Mehrer's plan of building a garage in the midst of Chelsea's pretty cottages.

AROUSED BY AN ENDURANCE RUN

Pennsylvanians See Necessity for Better Roads—Probability of New Turnpike from Allentown to Reading.

Two important results are likely to be the outcome of the Quaker City Motor Club's endurance run to Allentown, Pa., on New Year's Day, according to advices from that city. The first of these is the formation of a Lehigh County Automobile Club; the second, a free State turnpike from Allentown to Reading.

The Philadelphia club's event was a revelation not only to Allentown automobilists, but to business men and the public in general. It also opened the eyes of citizens with an eye to civic and industrial progress. Allentown has more than 400 owners of automobiles, a splendid showing in proportion to its population of 35,423. With more than 500 owners in Lehigh county it is in a position to organize a big automobile club.

Lehigh county has taken due advantage of the new State roads law, but all the new roads so far built run to the north of Allentown, into the cement belt. This also is practically true of the Walberts pike, the creation of John W. Eckert. In other directions no advantage has been taken of the State's liberality. It was just a trifle humiliating to Lehigh Countians to hear that the worst stretch of roads encountered on the Quaker City Club's run was between Allentown and Reading, and that the Lehigh roads were even worse that the Berks highways. This has brought about the movement for a State turnpike from Allentown to Reading, a distance of 36 miles, 12½ miles in Lehigh and 23½ in Berks. The chief obstacle to the building of State roads in Lehigh county has been the objection of the people of the townships, despite the fact that the townships need pay only one-eighth of the cost. The example set by the automobile run, however, has had a good effect in liberalizing views, and many of the farmers feel it is about time that permanent roads be built. Another leaven is the fact that many of the farms in the townships affected are owned by residents of Allentown, where there is a wonderful sentiment in favor of paved streets. Allentown can now boast 12 miles of asphalted streets, at an average cost of about $6,000 a block. This mileage of paved streets would be greater but for the fact that the municipality hasn't quite kept pace with public demand in the movement. Farmers coming to Allentown are of course delighted with the paved streets, and they have come to think that if city people can pay $6,000 for a block of good road, it isn't too much to spend $6,000 to $8,000 for a mile of good turnpike in the country, especially when the township need pay only one-eighth, the State and the county paying the rest. Of the proposed road about 3¾ miles would run through South Whitehall, 3 miles through Lower Macungle, and 5½ miles in Upper Macungle, Lehigh county, and the cost to the townships would not be more than $1,000 a mile, perhaps less. The total cost of the proposed turnpike between Allentown and Reading would be somewhere between $200,000 and $250,000, and could be finished with State aid in five years.

Two Police Wagons for New York.

Two automobile patrol wagons have been added to the New York City Police Department's rolling stock—one gasolene and the other electric. When it is determined which form of power is the more practical for the city's needs, other wagons will be purchased. The gasolene patrol wagon is attached to the Twenty-second precinct in West Forty-seventh street, and the electric makes its trips to and from the new Tenderloin station, in West Twentieth street. They are alike in appearance, but differ somewhat from the horse drawn wagons in being larger and in being painted a pea green color. The New York department expects to prove what police departments in many other cities already have learned, that the self-propelled vehicle is far superior to the horse drawn vehicle where quick action is necessary. After "seeing for themselves," it is expected that so far as possible the entire department will be similarly equipped.

Slow Running to Test the Motor.

Probably the best test of the condition of a motor is to run it as slowly as possible, observing whether its action is perfectly even or not. In many cases, to be sure, a motor which runs powerfully and well at normal or high speed, will not "hit evenly" when throttled down, owing either to improper carburation or to uneven ignition. The motor which runs perfectly well at low speed, however, usually retains its action under higher speed and load conditions, provided only it is equipped with a proper carburetter. Incidentally it should be mentioned that a prevalent and most deceptive cause of irregular running at low speeds is lost motion in the linkage between the control levers and the carburetter and timer. Where such slack exists, even a slight amount of vibration is often sufficient to throw out the regulation.

Japan Gives Precedence to Automobiles.

Japan is fast catching up to the eastern world in civilization. In the detail of recognition of the supremacy of the automobile in traffic, the land of Nippon would seem to be a bit ahead of its rival nations; for among the regulations recently issued by the police department of Tokio appears the following: "Automobiles shall have precedence in the street to fire engines, post carriages and military, funeral or the processions of the people."

CINCINNATI PLANS A MOTORDROME

Land Purchased and Half the Necessary Money Pledged—Proposed Site Located Amid Picturesque Landscapes.

Cincinnati may have a motordrome. Land for the project has been purchased and $50,000 of the necessary $100,000 already has been pledged. The men interested in the scheme are Harvey Myers, manager of the Latonia race course; Sid Black, John J. Ryan, ex-Mayor Julius Fleischmann, and other prominent Cincinnatians.

The course will not be built in Ohio, but across the river in Kentucky, adjoining the famous Latonia trotting track. That the Cincinnati project will be carried through seems possible, as the men interested in the venture have not press-agented the scheme at all; rather the opposite policy has prevailed, as the land was bought and all the preliminary arrangements made before any but the few interested persons knew anything about it.

The site for the proposed track is on the Licking river, near the Latonia property, and was purchased by Mayor J. T. Earle from the Latonia Racing Association It comprises 65 acres and the scenery is just the sort to make a popular summer resort, which it is planned to do.

Regarding the track no official details have been made public, but it is stated that it will probably be a mile and one-half course banked to such a degree that will preclude the possibilities of accidents attendant to high speeds on insufficiently banked tracks.

Besides the automobile track it is planned to make a popular resort by putting on all kinds of amusements along the line of the Ludlow Lagoon, a popular place with Cincinnatians. As soon as the damming of the Ohio river is completed the Licking river, which borders the property, will be navigable, and motor boat races upon it will be a possible feature. Naturally a large club house figures in the plans of the promoters.

Automobile racing around Cincinnati has heretofore been confined to the Latonia race track, but the managers do not court it because of the expense of repairing the track before and after each meet. Therefore the horse track people are interested in the new project, to the extent of investing their money in the proposed scheme, and selling the property at a reasonable figure, upon condition that no horse races be held on the new track when it is completed.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

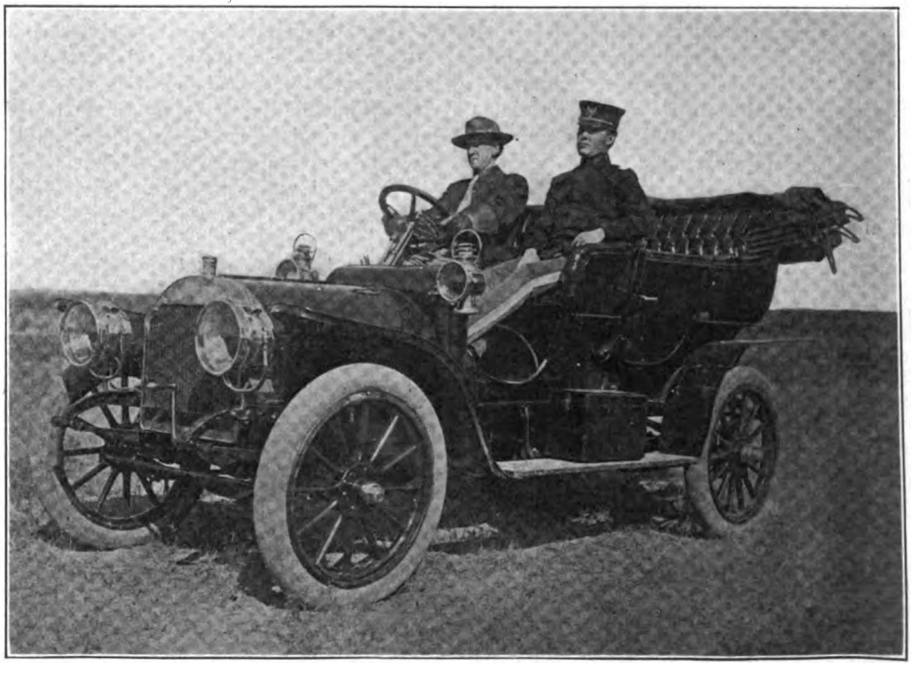
MOTOR CAR AID IN MAP MAKING



Supersedes the Prairie Schooner and Army Mule in a Topographical Expedition —Lieut. Gimperling's Outfit.

That beloved American military institution, the army mule, which has for so many years been at once the reliance and the despair of those responsible for the army's overland travels, is threatened by the motor car. It is only an entering wedge so far, but is redolent with suggestive prophecy. For the first time in army circles a topographical mapping expedition is to use a motor car instead of a mule team for transportation across the territory under observation. The innovation is due to the enterprise of Lieut. Gimperling, of the Twenty-first U. S. Infantry, and the enthusiasm of H. M. Westcott, his personal friend, who is the owner of the machine. When Lieut. Gimperling had been detailed to make a progressive military map of Southern Arizona, he secured the permission of General Thomas, commander of the Department of the Colorado, to use Westcott's automobile instead of the mule team and prairie schooner outfit usually employed.

As it is, the trip will take several months, although the car, a Stoddard-Dayton, will be able to make as great a mileage in an hour as the mule team could make in a day. Starting from Denver, the party, consisting of Gimperling, Westcott and Arthur Harris, the mechanician, will go to Pueblo and thence along the old Santa Fe trail through New Mexico to Arizona. The ultimate objective point is Fort Huachuca in the south central part of Arizona, and the topographical mapping to be done covers a large part of Southern Arizona. The accompanying pictures illustrate the old and the new way of prosecuting the important sort of task to which Lieut. Gimperling has been assigned. The first shows him standing at the head of his four-mule team. The sturdy animals with the lumbering prairie schooner to which they are harnessed present a quaint and curious contrast to the spick and span automobile wherein the young officer is seated, the owner of the vehicle at the wheel, ready to start upon his journey.

THE OLD WAY: LIEUT. GIMPERLING AND HIS PRAIRIE SCHOONER

THE NEW WAY: LIEUT. GIMPERLING AND HIS STODDARD-DAYTON

RIVAL FOR STEAM ROAD ROLLER

Oil Cooled Gasolene Motor in Machine for Highway Work—Other Novel Features in the Device.

The road roller is a type of vehicle, to which the gasolene motor would appear to be hardly suited because of its extreme light weight in proportion to its power. The use of the steam engine in this capacity has become so well settled, moreover, and the demand for road rollers would appear to be so small, comparatively speaking, that the development of a gasolene machine would seem to be hardly profitable. Nevertheless, a line of these machines is now being built by the Austin-Western Co., Chicago, in sizes ranging from seven to fifteen tons, the entire design being laid out with regard to the novel form of motor employed.

As a matter of fact, in at least one respect these machines have outrun their presumptive evolutionary ancestor, the automobile, in that they are adapted to oil-cooling, no water being carried, and the cooling oil being used over and over in the system. In other respects they are very automobile in construction, having clutches, change speed gears, wheel steering, and single lever speed control. Otherwise they follow the time honored form of the steam roller, both in general outline and in massive detail. Fuel tanks are provided holding sufficient gasolene for an entire day's running, but by using a trailer the supply may be extended almost indefinitely, thus eliminating the necessity for a tender.

EXPERIMENTAL ROAD TREATMENT

Results of Comparative Methods Conducted in Newton, Mass.—Materials Used and Cost per Yard.

In the search for suitable methods of construction for the American highway, there is a marked tendency to overlook importance of highway maintenance, though happily the mileage of roads once good, now grown into poor condition through neglect or careless handling is yearly diminishing. At the same time it is plain to see that however much the road makers may know of the ideals of laying foundations and building up the bed of the road, the actual working surface both in first state and in renewed condition, remains a continual source of anxiety and question. In a few notable instances, road builders are facing the matter squarely and outlaying considerable amounts in what are acknowledged to be experiments pure and simple.

In this connection the work of Charles W. Ross, street commissioner of Newton, Mass., is a striking example of straightforward effort. The stretch of Commonwealth avenue running out from Boston for a distance of five miles through Newton, has been subjected to a number of comparative treatments to which it is particularly well suited as supporting a variety of traffic. The southerly driveway is used exclusively by automobiles, while the northerly driveway is given over to carriages. An opportunity is thus given not simply for comparing the efficiencies of different methods of treatment on the same road, but also of studying the results under different sorts of usage. Commissioner Ross outlines these tests in a recent article in the Good Roads Magazine.

In 1906 one section of Commonwealth avenue was treated, 3,500 square yards of tarvia being put on," he says. "That was the first experiment we tried, and was on a five per cent. grade. The roadway was swept clean, and the tarvia came to us in tank wagons from Everett. When it got to the road the tarvia was at a temperature of about 170 degrees to 180 degrees. That road went through the winter and came out last spring in fine shape, and to-day is better than it was last year.

"I think that rubber tires have had the effect of rolling it down and keeping it perfectly smooth. There has been no expense this year on this roadway, except, when, in June, a light coat of stone screenings was spread upon it. This was rolled in by the wheels of the automobiles, and that is the only outlay on this road for over a year. The screenings are rolled entirely in now, and the road is as smooth and hard as any asphalt street, and is not slippery in rainy weather. Horses get good footing on it, on account of the large amount of screenings that have been rolled into it.

"Another section of Commonwealth avenue was covered with tarvia this year. The work was commenced as soon as the weather became hot and dry, which was about the first of June. This preparation was applied in the way followed in treating the section previously mentioned, except that it was covered with fine screened gravel instead of screened stone. . . . . During the entire season this preparation has been very satisfactory, as it has been free from dust, seems to work fully as well as the fine screened stone, and could be obtained at a much less expense. We used 28,843 gallons of tarvia and that cost $0.1115 per square yard. These figures are somewhat higher than they otherwise would have been, because we had to haul the tarvia by teams something over twelve miles.

"The section treated in 1906 cost about 14 cents per square yard. A heavier coat of tarvia was put on, which, of course, added to the expense of the work. . . . . You can to-day take a screwdriver and lift up the surface of this roadway to the depth of over an inch. It is like India rubber, and I see no reason why it should not last two or three years without any additional expense.

"A light coating costs less in the first place, but it cannot last as long as a heavy coating. After this work was done we were so well satisfied that we tried experiments on other streets which were subject to heavy traffic. A street in Newton Lower Falls had very heavy teaming over it; tarvia was put on and spread with brooms, at a cost of 19 cents per square yard, but in my opinion it is going to last three to five years. It seems to me that a road which is subject to heavy traffic is much different from a road where there are only light carriages and automobiles. The road just mentioned was first swept, then spiked up with a roller and covered with a coat of one-inch stone. This was rolled down to a smooth surface, and something over one and one-half gallons of tarvia per square yard were applied to the stone. This was covered with screened gravel, as I have described before, and rolled in with a steam road roller.

"Another section of Commonwealth avenue was by contract treated with 'asphaltoilene.' This did not include the sweeping of the roadway and preparing it for asphaltoilene, as that was done by the city. Six cents was the price paid for furnishing and applying the asphaltoilene, which was brought to the city in tank cars and pumped into the sprinkling wagon furnished by the contractor. . . . . In some cases it was necessary to put more on the center of the streets than near the gutters, as the material flowed toward the gutters, and for about two days had to be swept with brooms into the center of the road. After that time it penetrated the roadbed enough to keep its place until the coat of screenings was applied. This could be done with a coating of stone screenings, or of fine screened gravel, which I think I much prefer to stone screenings in such cases. The road was then closed to traffic for about 48 hours. After that it was ready to roll with the steam road roller. . . . . It has been there for over two months, and much resembles the tarvia road, only that it is more elastic and easier for a horse to travel upon.

"Texas oil has been used by the city and has been applied in the following manner: First we applied light Texas or fuel oil by heating the stone screenings on a sand heater, and pouring the oil upon the screenings, putting on from about 25 to 30 gallons of oil per cubic yard of stone. This mixture was turned over by shovels and piled up. It was allowed to remain about 12 hours in a large heap, then was shoveled into the teams, spread with shovels upon the surface of the road, and immediately rolled down with a steam roller.

This work was satisfactory, and in my opinion is a good way to apply oil to the surface of a street. On other streets we tried a heavier Texas oil which had more of an asphalt base. This was spread upon the street by a watering cart with perforated tubes in the rear, the flow through which could be regulated by valves to give the desired amount per square yard. This was allowed to remain on the surface of the street from ten to twelve hours, and then covered with a light coating of screened gravel. The expense for labor was much less in this case than in the former, and the material used cost 2½ cents per square yard. The quantity of oil used was a little less than one-half gallon per square yard, and one-half the roadway was treated at a time, allowing the other half to be used by teams, which were kept off the treated part for three or four days, until the oil had plenty of time to penetrate into the roadbed. After this there was no spattering, nor was it otherwise disagreeable to traffic.

"Another section of Commonwealth avenue was treated with a mixture of Portland cement. The surface of the roadway had been thrown off by the automobiles, was worn down to the No. 2 stone, and its center, which should have been higher, was two or three inches lower than its sides. That material was screened out and put back into the surface of the road. Then we mixed a very thin grout of four parts sand with one part cement, spread it on with large coal shovels, and swept it in with brooms. That mixture soaked down, grouted the stone together, flush up on the surface, and made it perfectly smooth. The grout was put on about the 10th of June, and has given very good satisfaction. The cost per square yard of this work in detail was as follows: Cement, 3.36 cents; sand, 0.38 cents; labor, 2.03 cents; teaming, 1.56 cents, making a total cost of 7.33 cents per square yard."

WOMEN CABBIES QUIT IN DISGUST

Frau von Papp of Berlin Found the Occupation too Strenuous—Rude Men Discouraged Mme. Lutgen of Paris.

Berlin's chauffeuse is no more! Frau von Papp, the only woman licensed as a public automobile driver in the German capital has not shuffled off the mortal coil, but she has given up in disgust the career of cab driver according to cable advices from abroad. Thus ends an innovation which aroused much interest as to the outcome, particularly in this country, where every item bearing on the sex equality question is seized with avidity by those women who would cope with men on an equality upon the field of hard labor not intended for those of the gentler and less physically able sex.

Frau von Papp has now come to the conclusion that driving an automobile cab is a work not designed for women. She says she did not possess sufficient endurance to withstand the arduous duties of the calling. Being out at all hours and the necessity of facing all kinds of weather did not agree with her, in addition to which, the baroness chauffeuse declares, the occupation of public driver is one which must eventually prove distasteful to women of finer instincts, wherever attempted, something that Mere Man thought when Progressive Woman decided to invade his field of labor. Therefore Mere Man will smile a broad smile when the baroness's conclusions become generally known.

The experiment with women cabbies in Berlin has been similar in Paris, states the dispatch. Madame Lutgen, formerly Countess du Pin de la Bueniere, has decided to give up being a taxicab driver and will attempt to secure a position as coachwoman in a private family. Madame Lutgen divided honors with Madame Dufaut in the new occupation. It was a matter of great surprise when the former countess decided to quit as it was believed she was in the business to stay. Madame Lutgen's reasons for giving up the work are much the same as Frau von Papp's. She complains of having been grossly insulted by what she declares were "dignified looking men."

"Although I received occasional tips of larger demonination than usually given to other cabbies," Madame Lutgen is accredited as saying, "still there have been days when after being out in the rain and cold all day, I have taken but one fare. Some men, too, took advantage of the fact that they had a woman cabby to give free rein to language of a most shocking sort. I do not believe being a cabby is the proper sort of occupation for women."

"Women in this business are a nuisance," a manager of a large Berlin concern that keeps automobile cabs for hire, is said to have declared. "There is no doubt that the experiment in Berlin is dead. I shall certainly engage no more women. They do not know how to take care of their cabs and they do not earn as much as the men. Women chauffeurs always expect the men to do all the work at the garage and to wait on them, which the men are unwilling to do, nor is there any reason why they should do so. Women are not cut out for automobile cab drivers."

State Association for West Virginia.

If the efforts on the part of the Ohio Valley Automobile Club, of Wheeling, meet with the success they merit, West Virginia will have a State automobile association. At the last meeting of the Wheeling organization a resolution was passed with this object in view. A convention, the date of which cannot be determined until the various clubs have been heard from, has been called to meet in Parkersburg, some time during February, when the State association will be organized. At its meeting the Ohio Valley Automobile Club voted to purchase signs to mark the highways in the county most frequented by automobilists. The county commissioners have agreed to stand half the expense. The club will purchase the signboards and the county officials will see that they are put up.

Chauffeurs Organize a State Association.

Illinois chauffeurs have decided to take hold of the chauffeur question themselves and settle it to everybody's satisfaction. The Illinois Chauffeur Association has therefore been formed to "raise the moral, intellectual and social tone of chauffeurs in the State; to assist owners to get good, efficient drivers for their cars and to exercise a guardianship over members calculated to keep them up to a high standard." The officers of the association are: President, F. M. Johns; first vice-president, A. Sanderson; second vice-president, D. F. Farrar; treasurer, G. F. Chapin; secretary, H. W. Powers; corresponding secretary, E. Wallace; board of managers, F. W. Kickbush, Thomas T. North and William O'Hara.

Inter-State Organization in Brooklyn.

Another "helping hand" automobile association has been formed, Brooklyn being the offender this time. It is called the Inter-State Motorist Association, and has been incorporated under New York laws The association, which will provide "legal aid" to persons arrested for breaking the speed laws and will toy with legislation, is to be located at 177 Montague street.

Batchelder Heads Worcester Club.

The governors of the Worcester Automobile Club, of Worcester, Mass., met last week and elected a president and a vice-president. George W. Batchelder will occupy the chair and Charles M. Booth will assist him.

WITT WAS NOT QUICK WITTED

Might Have Escaped with Light Penalty for Larceny of a Lamp—Now Charged with Stealing an Automobile.

It would have been far better—better for himself—had F. A. Witt in the pursuit of his psychologic studies acquainted himself with Professor Munsterberg's treatises on human emotions and the control thereof; for if he had done so, doubtless he would not now be languishing in jail, charged with stealing an automobile. When Witt was arraigned in Judge Chambers's court in Los Angeles, Cal., one day recently, and asked to plead to a charge of having stolen an automobile lamp, profound astonishment was pictured on the young man's face. In a dazed voice Witt pleaded not guilty and thereby almost railroaded himself to the penitentiary. For be it known, Witt did not steal the lamp; he stole the automobile.

The car belonged to George Hart, a hotel proprietor, and was stolen by Howard Francis, J. K. Harrington and Witt. The last named was the chauffeur who drove it away. Francis was arrested shortly afterwards at Bakersfield; Harrington fell a victim to the detectives at Sacramento and Witt was "pinched" in Los Angeles last week. Harrington and Francis confessed, and on account of their previous good records escaped the penitentiary and are now doing time in the city jail. Through some error Witt was charged in the complaint with having stolen merely a lamp, and when the charge was read he was so dumbfounded that he pleaded not guilty, when an admission would probably have gotten him off with a fine. But Witt could not control his emotions and so was bound over for trial. In the meantime the charge in the complaint was changed.

Got Even for Affront to His Bull.

"Farmer John" Graham, of Upper Graham, Pa., got "square" one day last week for the bump given his big bull by a touring car along the Manatawna road last September. The bull was the challenger and was a month recovering from the shock. Another automobile of the same color, or perhaps it was the same one, opines Graham, got stalled on Manatawna hill Wednesday afternoon. Graham was at work in a field nearby. The two men and finally the two women in the car pleaded with Graham to hitch his team to the axle and pull it up the hill.

"I will for $25," said Graham, thinking of the occurrence last summer, and planning to get even.

After much haggling, during which he described the bump the last red automobile gave his bull, the farmer compromised on $15, paid in advance.

The Week's Patents.

868,210. Cushion Tire. William D. McNaull, Toledo, Ohio. Filed Sept. 1, 1906. Serial No. 333,012.

1. In a wheel, the combination of an inner rim, an outer rim, a strip of flexible material between the rims, secured to the inner and outer rims at alternate points, blocks on the inner rim against which the strip rests, bolts passing through the strip and engaging sockets in the blocks on the outer rim, and pins passing through the blocks and holding the studs in position.

868,251. Carburetter. Leon Bollee, Le Mans, France. Filed April 4, 1904. Serial No. 201,549.

1. A carburetter comprising a variable sized mixing chamber constituted by two movable walls therein, a fuel outlet pipe extending into said variable sized chamber, and means for simultaneously and proportionately regulating the size of the mixing chamber and the opening of the fuel outlet, substantially as set forth.

868,265. Carburetter for Internal Combustion Engines. Edward V. Hartford, New York, N. Y. Filed Aug. 25, 1905. Serial No. 275,738.

1. A carburetter having a valve and automatic and frictional means for regulating the action of the valve.

2. A carburetter having an automatically acting valve and frictional means for retarding the action of the valve.

868,293. Acetylene Gas Generator. Edwin M. Rosenbluth, Philadelphia, Pa. Filed March 9, 1907. Serial No. 361,562.

1. In an acetylene gas generator, the combination with a valve casing having a port and forming a trunnion for said generator; of a plug in said casing having a port complementary to the port in said casing; and means arranged to maintain said plug stationary in said casing, substantially as set forth.

868,319. Reversible Automobile Fender. Luther P. Barrett, St. Louis, Mo. Filed March 4, 1907. Serial No. 360,509.

1. An automobile fender having the shape of a double cone and rotatably mounted upon suitable bearings.

2. An automobile fender consisting of an upwardly and rearwardly inclined axle, and a double cone of spring metal hoops rotatably mounted up said axle.

868,337. Combined Steering and Braking Device for Motor Cars. Ernst H. Geist, Cologne, Germany. Filed Feb. 26, 1907. Serial No. 359,438.

1. In combined steering and braking devices for motor cars, wheels, each being revolubly secured in individual frames connected to the chassis by vertical pivots, means to turn the wheels with their frames at will in parallel positions at an angle to the line of motion of the car and into convergent positions substantially as described.

868,404. Spark Plug for Explosive Engines. Francis W. Brady, Englewood, N. J. Filed May 11, 1906. Serial No. 316,322.

1. A spark plug for explosive engines, provided with a stationary electrode, the stem of the stationary electrode being supported in insulating bearings and being surrounded intermediate of said bearings with an air insulation space communicating with draining passages; substantially as described.

868,405. Wheel. George F. Brandenburgh, Irvington, N. J. Filed April 6, 1906. Serial No. 310,248.

1. In a wheel, the combination of a hub having a closed annular chamber, hollow spokes opening at their inner ends into said chamber, hollow felly sections independent of one another and each providing at its inner side a slideway adapted to receive the end of a spoke as a plunger, and a tire around said felly sections.

868,585. Force Feed Lubricator. Albert A. Stelting, Madison, Wis., assignor to The Madison Kipp Lubricator Company, Madison, Wis., a Corporation. Filed Sept. 26, 1905. Serial No. 280,148.

1. The combination with a rotary driving shaft and a plunger adapted to be reciprocated thereby, of an eccentric mechanism mounted on said driving shaft and comprising independent elements mounted on said shaft and eccentrically thereto and adapted to be adjusted relatively to each other to vary the eccentricity of said eccentric mechanism relatively to the axis of said driving shaft, and power transmitting devices interposed between said eccentric mechanism and the said plunger.

868,611. Vehicle Wheel. Winfield J. Mitchell, Pittsfield, N. H., and James R. Mitchell, Templeton, Mass., assignors to Mitchell Punctureless Pneumatic Tire Company, Swampscott, Mass., a Corporation of Massachusetts. Filed Nov. 14, 1906. Serial No. 343,446.

1. A vehicle wheel comprising a chambered rigid body having an inner seat, a pneumatic cushion bearing thereon, two outer seats, an annular spacing member formed independently of the outer seats, and rigidly attached thereto, said spacing member having leg-receiving openings between the outer seats, an elastic tire U shaped in cross section, and having base portions permanently bearing on the outer seats, and leg sections bearing on the pneumatic cushion and on the elastic tire, and movable in said openings.

868,673. Automobile Transmission Gearing. John W. Lambert, Anderson, Ind. Filed March 27, 1905. Serial No. 252,332.

1. A gearing of the type set forth, comprising a driving disc, a driven disc adapted to be brought into frictional engagement with the driving disc, a driven shaft carrying the driven disc, means for shifting the driven disc on its shaft, a supplemental two-speed reducing gearing mounted wholly on said driven shaft and embodying a sprocket wheel loosely supported on said shaft, a train of gears permanently in mesh, one of said gears being connected to the sprocket wheel and one being rigidly secured to the driven shaft, means for locking the sprocket wheel and attached gear against independent rotation to drive the sprocket wheel directly at the same speed as the driven shaft, and means for locking some of said gears against rotation around the driven shaft, whereby the sprocket will be driven through the train of gears and at a lower speed than the driven shaft.

868,689. Explosive Engine. Harry M. Neer, Columbus, Ohio, assignor to The Neer Air Cooled Engine Company, Plain City, Ohio, a Corporation of Ohio. Filed Nov. 7, 1906. Serial No. 342,334.

1. The combination with an explosive engine, of a fan shaft, connections between said engine and said fan shaft, a fan mounted upon the fan shaft, and a yielding connection between said fan and the shaft upon which it is mounted.

868,693. Device to Prevent Tampering with or Theft of Motor Vehicles. Leon Ottinger, New York, N. Y. Filed Dec. 18, 1905. Serial No. 292,247.

1. An anti-theft device for motor vehicles, comprising a latch mechanism for the bonnet or hood, an electric switch for the motor circuit, and a lock for controlling both said switch and said latch mechanism.

868,707. Carburetter. Walter C. Schneider, Detroit, Mich. Filed Feb. 25, 1907. Serial No. 359,232.

1. A carburetter comprising a carburetting chamber, a channeled hub within said chamber, a feed inlet passage opening leading into the channel of the hub, a manually

operated valve to control said channel, and a rotatable fan supported upon said hub below the valve.

868,728. Automobile Vehicle. Jules M. M. Truffault, Paris, France, assignor to Societe des Automobiles Truffault, Paris, France. Filed April 29, 1907. Serial No. 370,857.

1. An automobile vehicle comprising in combination two small grooved pulleys keyed on the driven shaft, two large grooved pulleys solid with the driving wheels and independent of one another, two belts connecting each a small pulley to the large pulley situated on the same side, lateral sliding members connected by one of their ends to the rear train which carries the two large pulleys solid with the wheels, lateral rods pivoted on a fixed part of the chassis and inclosed in the lateral members, operating rods connected by one end to the lateral members, an operating lever connected to the operating rods, a vertical ball and socket suspension situated between the chassis and the rear train, and a friction abutment inserted at each side between the chassis and the rear suspension, subtantially as described and for the purpose set forth.

868,732. Press for Vulcanizing Pneumatic Tires. Amedee E. Vincent, Noisy-le-Sec, France. Filed June 12, 1907. Serial No. 378,563.

1. A press for vulcanizing pneumatic tires comprising, an upper half-shell securely fixed in position, a lower half-shell, the main cylinder of the press and its piston, a movable platen borne by the piston of the cylinder to which the lower half-shell is secured, a core on which the pneumatic tire to be vulcanized is applied, hydraulic jacks whose cylinders are securely fixed in position and which bear the core, springs which join the movable platen of the hydraulic press with the core, substantially as described and for the purpose set forth.

868,752. Variable Reactive Coil. Ralph E. Barker, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Jan. 23, 1907. Serial No. 353,627.

1. A variable reactive coil comprising a core forming a closed magnetic circuit of varying cross section and a winding on said core, the core and winding being relatively adjustable.

868,757. Oil Regulating Valve. George S. Bennett, San Francisco, Cal. Filed Oct. 1, 1906. Serial No. 336,834.

1. In a regulating valve, the combination of a valve body having a seat therein, a valve stem having a seat at its end and means to regulate the flow of fluid when the valve is full open at the valve seat,, and a flange on the valve body above the valve seat within which the valve stem slides, substantially as described.

868,765. Internal Combustion Engine. Herman Dock, Wyncote, Pa., assignor to The Dock Gas Engine Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 19, 1906. Serial No. 343,949.

1. In an internal combustion engine an exhaust valve controlling means including a cam shaft a main cam, an oppositely arranged secondary cam carried thereby and in alignment therewith and means for projecting and retracting said cam to move in into or out of an operative position, said means including a longitudinally movable inner shaft passing through said secondary cam.

Solar Lamps—SHOW THE WAY

An Automobile Without Solar Equipment

cannot possibly reach its highest state of perfection, for Solar Lamps and Generators are recognized throughout the World as Standard.

Simplicity of construction is a most necessary point to consider in the building of an automobile lamp. Solar Lamps have fewer parts than any other make—each part is of heavy drawn brass. No parts are soldered—but are riveted or screwed together. Each lamp is tested for accuracy of focus before leaving the factory.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

The Mitchell

The car you can afford to buy—and *keep*

The Mitchell appeals *to you*, Mr. Business Man, because it gives you just as much *pleasure*—just as much and as *good service*, is just as *stylish* and neatly *finished* as any car, and doesn't cost you a small fortune to *buy*—or *keep*.

The Mitchell at $2000 is the standard automobile value.

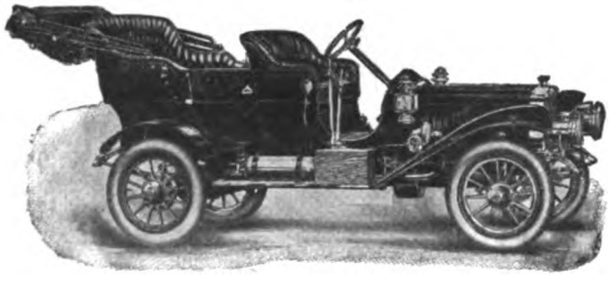
Prove it—Mr. Business Man.

Get *demonstrations* of the extravagantly high-priced cars—and then try the *Mitchell* over the *same* route.

The Mitchell agent will be glad to take you out if you're interested for 50 or 100 miles any time you say. Call him up (it places you under no obligation)—*Challenge* him—

Just say, "Show Me."

He'll come around with a car and show you a "silent argument" that will get your order or he will retire without a word.



Our catalog No. 18 is fully descriptive of the Mitchell 1908 Touring Car $2000—Limousine $2800—Roadster $1250 and Runabout $1000. Write for it—we'll also send letters from users, proving the Mitchell to be the most economical car to *operate*.

Mitchell Motor Car Co. 278 Mitchell Street, Racine, Wis.

Member American Motor Car Mfrs. Ass'n.

Just say "Show Me"

This car—shown here—35 h. p., 4 cyl., speed 50 miles, finished in Mitchell blue—price $2000—is excellent throughout—the car you ought to have at the price you ought to pay.

One Price for Warner Auto-Meters

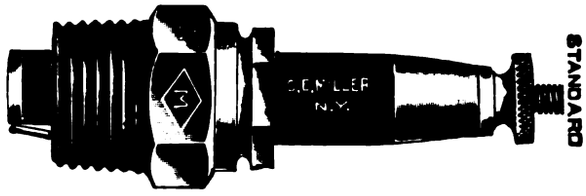
NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also—and the jobber cut the price.

Then there was fun in the camp. That hurt us—it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out—that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.



THIS STAND IS POSITIVE.

The Heavier the Load the Greater the Saving

The first cost of TIMKEN equipment for Commercial Vehicles is out of all proportion to the resultant saving in up keep and increased earning power through added carrying capacity.

Timken Roller Bearing Axle

illustrated above is especially designed for vehicles doing heavy duty. This Axle is fitted with TIMKEN ROLLER BEARINGS in the knuckle head, making steering, even under the full load carrying capacity easy and simple—is forged out of heat treated steel and equipped with TIMKEN ROLLER BEARINGS in the hubs.

TIMKEN ROLLER BEARINGS are especially designed to carry as much end thrust as radial load—both principle and construction providing for an evenness of wear that does not impair or destroy in any manner the characteristics of the bearings. This is the TIMKEN principle distinctive and individual—and cannot be found in any other type or form of anti-friction bearings and that is the reason WHY the Successful Commercial Vehicle Builders use

Timken Roller Bearing Axles

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company, South Bend, Ind.

The Car of Steady Service

as applied to the

Rambler

is more than a mere phrase, it is a title earned through correct design and careful construction and proven by years of hard, constant service wherever power-driven vehicles are known.

The practical qualities that established the Rambler reputation are,—

1st—APPLIED POWER. By this we mean actual tractive force as applied to the road wheels. Owing to the straight line drive of the four-cylinder models and the direct chain drive in the two-cylinder cars, Ramblers have greater propelling force per pound than any other car on the market.

2d—DEPENDABILITY. Ramblers are built to stand the test of hard, daily service over the worst of American roads. This condition is not reached by mere weight and masses of metal, but by simple, scientific construction in which each element is stronger than the strains upon it can ever require.

3d—PRACTICAL ROAD VALUE. With the vast facilities of an enormous plant like the Rambler factory, skillfully directed to the production of two models only, greater value per dollar can be offered than is possible in a plant of lesser output.

In short, the Rambler is a car of

Power, Service and Value

Ordinary business policy dictates a careful examination of its many high qualities before ordering your new car.

Our 1908 catalog fully describing two touring cars and a high-powered roadster is at your service: write to-day.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, January 23, 1908. No. 17

RECEIVERS FOR E. V. CONFIRMED

Connecticut Court Makes Appointment of Barrett and Nuckols Permanent—Allowances Granted.

In the Superior court at Hartford on Monday last, Judge Shumway made permanent the appointments of Halsey M. Barrett and Henry W. Nuckols as receivers of the Electric Vehicle Co., and allowed them $600 each for their services during the six weeks, December 10 to January 21. In doing so, Judge Shumway asked if the receivers expected to make claim for compensation in the other jurisdictions where they have been appointed receivers. Mr. Nuckols said he had not thought so. M. Toscan Bennett, lawyer for the receivers, said that he did not want to have it understood that the $100 a week, which the receivers asked for, could be taken as a precedent for their future compensation. John R. Hills and F. C. Billings, who appraised the property of the company, were each allowed $1,000 for the service.

Judge Shumway also made an order that all claims of creditors be presented to the receivers within four months from January 17, 1908.

Search for Missing Grout Assets.

The receivers of the Grout Bros. Automobile Co., Orange, Mass., are endeavoring to clear up the alleged disappearance of certain assets of the firm, and for that purpose Karl Grout was examined in court last week as to the reported mutilation of a ledger, and the alleged sale of an automobile at just about the time the concern went into the receivers' hands. He produced several pages from a ledger and book of accounts due, and testified to the sale of the automobile in question to a Boston man for $1,000, half of which was received by him and the rest by Charles Grout, who is supposed to be in Seattle, Wash., at the present time. There was also inquiry as to supplies said to have been taken from the factory and placed in a barn. The hearing was continued.

Knox Ready for Creditors' Officers.

A. N. Mayo, trustee of the Knox Automobile Co., Springfield, Mass., has called a meeting of the preferred stockholders for Tuesday, 28th inst., at which time officers of the reorganized company will be elected. Mr. Mayo reports that the resignations of all the present officials are in his hands. Under the terms of reorganizations, the capital stock of the company was increased from $500,000 to $1,000,000, and all of the creditors now are in possession of the preferred stock, accepted in payment of their claims, which gives them the voting power. They will elect the clerk, the treasurer and six of the nine directors at next Tuesday's meeting.

Frenches Offer to Withdraw Claim.

A meeting of the creditors of the St. Louis Motor Car Co., Peoria, Ill., has been called for January 28, to consider a proposition to be laid down by Jesse French, Sr., and his wife, Callie L. French. Mr. and Mrs. French have offered to withdraw their claim of $61,287.21 if they are allowed to have a certain touring car which was in the factory at the time the company was thrown into bankruptcy, and also if the balance they owe on unpaid stock subscriptions is struck off. J. M. Sholl, the trustee, believes that it would be for the benefit of all the creditors to accept the French proposal.

Diezeman Liabilities and Assets.

Schedules in bankruptcy of the Diezeman Shock Absorber Co., New York, which failed several weeks since, show liabilities of $41,913, and assets of $4,826, consisting of machinery, etc., at the plant in Hoboken, $3,250; accounts, $1,504; notes, $22; money deposit, $50. The largest creditors are Samuel Fisher, $22,402, and Carl Bomeisler, $11,987.

BOOMING A NEW WONDER-WORKER

Company Demonstrating Remarkable Capabilities of a Primary Battery—Its Novelty and Construction.

A primary battery suited to all purposes to which the accumulator or storage battery now is applied, yet weighing only half as much and costing in maintenance even less than commonly is charged by city electric light companies for the use of current alone, is the alluring offering presented by the Decker Electrical Manufacturing Co., of Philadelphia, which has come to New York for the purpose of exploiting the wonders of its product. The Decker battery is the invention of Frank A. Decker, also a Philadelphian, who, on the recommendation of the Franklin Institute, has been awarded the John Scott Legacy medal and premium for "the most deserving invention." The Decker company has offices at 371 Bullitt Building, Philadelphia, but at present is demonstrating the performance of the battery in a suite of rooms in the Mills Building, 15 Broad street, New York City.

While still practically unknown to the public, the Decker battery is not strictly new, since it first came to the attention of the scientific world a little over a year ago, when it received extremely flattering notice from a number of eminent authorities. It was then stated that the inventor had been working on the idea for several years. Since then, it is said, extensive tests have been made, an automobile equipped with the battery having been in use for a year or so, and various other special trials carried out with complete success. In the case of the car, it is claimed that the mileage obtainable with the new battery was just about double that which was developed by the original storage battery which it replaced.

Generically, the Decker battery is the or-

Digitized by Google

dinary two-fluid primary cell using graphite and zinc plates, but of improved mechanical construction in several respects. The essential feature upon which its novelty rests is in the method of renewing the "charge" by replacing the electrolyte and depolarizing solutions with fresh material as fast as they became depleted. To this end a two-compartment tank is used in conjunction with the battery, and the fluids are raised into the cell by pneumatic pressure when the current service is required. When the current falls off owing to depletion of the electrolyte, the cells are drained, the fluids being allowed to mingle with the supply in the tank, and afterward the renewed solution is pumped back into the cells which are then practically as good as new. The tanks ordinarily supplied contain sufficient liquid for three charges of the battery. The tension of a single cell is 2.2 volts on open circuit, and 1.7 volts on closed circuit. The cells may be confined in any way desired.

The original spply of chemical energy for the battery thus comes from the fluid, which is a solution of sulphuric acid and sodium bichromate. The charging process, therefore, which is analagous to the "charge" of the ordinary accumulator consists in renewing the supply of liquid. In addition to this the zinc plates must be renewed from time to time—usually after 3 to 8 charges of fluid have been exhausted, depending on the rate of discharge.

The scheme of the Decker Co. includes not simply the manufacture and sale of the battery, but also the purification of the electrolyte, from which the zinc salts are electrically deposited and the fluid prepared to be used over and over. The plan is to allow customers a rebate on used solutions, furnishing the fresh supply in tanks ready to install in the plant. The zinc plates are rolled and afterward amalgamated by a special process which tends to prevent gassifying in action.

As applied to automobile use, a special form of tank is used mounted in the front of the car and so arranged that it may be tilted downward, thus lowering it sufficiently so that the fluid will drain by gravity from the battery in the rear of the vehicle. When the tank is in its normal position, the fluid runs into the battery by gravity also, so that no pump is required to effect the charging. A two-way ball check prevents the electrolyte from surging back and forth when the car is on grades. The automobile type of battery is made up of 3-cup cells, that is to say, of a group of cells each having 3 zinc and 6 graphite plates, and weighs in all some 300 pounds. With the entire amount of fluid contained in the supply tank it is capable of 500 miles of average service. The total cost including maintenance and charging is much less than that of the storage battery, the first cost being about the same at present.

The assertion is made that by the use of the battery, current may be obtained at a guaranteed cost of not more than 15 cents a kilowatt hour, as against the usual charge of 25 to 30 cents, for current alone by the average city lighting company. A very liberal demonstration of the possibilities of electricity as supplied by a primary battery is afforded at the local office where a multiplicity of dazzling lights, various appliances, such as a sewing machine, dental engine, X-ray machine and an electric forge, furnish ample means of illustration.

That those most intimately connected with the venture are by no means inexperienced in corporation matters, is testified by the legend on the door to the outer office in New York, which reads:

O. A. Turner,
Mines & Mining.
Ely Central Copper Co.
Goldfield Souvenir Mining Co.
Decker Electrical Manufacturing Co.
Mr. Troupe.

Mr. Turner is a broad man of medium height and noticeably stoop shouldered, while Mr. Troupe wears white spats. There are numerous assistants and demonstrators to show the visitor around, and no one is permitted to come away without being convinced that he has seen wonderful things.

Davenport, Iowa—Meteor Motor Car Co., under Iowa laws, with $50,000 capital; to build automobiles. Corporators—C. N. Voss, H. F. Petersen, Arno L. Petersen, J. H. Haas, and W. F. Speers.

New York City, N. Y.—Continental Automobile Co., under New York laws, with $5,000 capital. Corporators—Henry Best, Walter E. Godfrey and George W. Hess, 60 Wall street, New York City.

Denver, Col.—Elderkin Electrical Co., under Colorado laws, with $100,000 capital; to make electrical current converters. Corporators—James Elderkin, Ellen M. Oviatt, Emeline T. Rundell, Clarence A. Granger and Burton F. Rickel.

New York City, N. Y.—National Auto Top Co., under New York laws, with $5,000 capital. Corporators—Andrew Herman and John J. Bush, 1904 Broadway; Robert Perlman, 8 East 113th street, New York City.

New York City, N. Y.—Broadway Motor Cab Co., under New York laws, with $100,000 capital. Corporators—Samuel K. Kellock and Frank P. Reilly, 60 Wall street; Mabel Gondchaux, 218 West 112th street, New York City.

In the Retail World.

The Marshall Automobile Co. lost two cars in a fire at Marshall, Texas, on January 17th. Loss, $3,000.

Devaney & Co., Hastings, Minn., will build a one story stone garage. It will be located at Third and Vermillion streets.

W. M. Ball, a liveryman at Devil's Lake, N. D., and C. A. Stottler, of Grand Forks, have formed a partnership and will establish a garage at the former place. Ball's former stables will be transformed into a garage.

The Elmore Motor Car Co. has opened sales rooms in Cleveland, with F. S. Rathwell and J. A. Carter in charge. The branch is located on Euclid avenue near East Nineteenth street, in the quarters just vacated by the G & J Tire Co.

The Studebaker Automobile Co., South Bend, Ind., has opened a branch house in Seattle, Wash., in connection with the Studebaker Bros. company northwest vehicle sales department at 308 First avenue, south. C. J. Zintheo, who formerly had the agency, will be in charge.

Two cars were destroyed and six others damaged in a fire which broke out in the Fifth Avenue Automobile Garage, at 45 West Forty-fourth street, New York City, Monday afternoon. The flames were subdued in fifteen minutes. A broken electric light wire is given as the cause.

J. B. Terry & Co., who have carried on an extensive electrical business in Cedar Rapids, Iowa, for a number of years, are preparing to "go into automobiles." Repair work of all kinds will be the specialty, and the building occupied by the firm will be enlarged to meet the requirements.

Ground has been broken for the new sales building of the Buick Motor Car Co., at McGee street and Admiral boulevard, Kansas City. It is to be a three story structure of dark brown paving brick with Carthage stone trimmings. The dimensions will be 95x72 feet and the cost approximately $40,000.

Jacobs & Bartlett is the name of a new firm in Boston, and is located at 887 Boylston street. Jacobs was formerly with the Thomas agency and more recently sold the Kilgore shock eliminator, and Bartlett has been connected with the Royal Tourist agency. The firm will handle the Allen-Kingston car.

AGENCY BARS ARE NOT LET DOWN

Licensed Association Refutes Reported Abandonment of Its Exclusive Policy —Will Reaffirm Its Position.

Although it was reported that the Association of Licensed Automobile Manufacturers had abandoned its exclusive agency policy, or at any rate, would not longer object to licensed agents handling unlicensed cars, such proves not to be the case. It is understood that the report grew out of a circular letter to that effect which was issued by an official of another organization but General Manager Budlong, of the A. L. A. M., stated that far from abandoning the exclusive policy or winking at evasions, it is the intention of the Association to reaffirm its position and to make it unmistakably clear and emphatic that all who violate the policy will pay the penalty. Budlong is now engaged in drafting a letter along these lines.

New York Supply House Changes Hands.

The Detroit Motor Car & Supply Co., at Broadway and Eightieth street, New York City, has been succeeded by the Green-Beebe-Weed Co., Inc., the latter having bought the business, lock, stock and barrel In addition to handling a complete stock of automobile accessories and supplies, the old concern was New York representative for the J. N. Willys Co., of Elmira, N. Y., which connection has now been terminated. The new company will devote itself to the accessory and supply business exclusively.

Overland Makes an Offer to Creditors.

The Overland Automobile Co., Indianapolis, which found itself in straits due, it is said, to its sponsor, D. M. Parry, having over-extended himself in the financing of a trolley line, is seeking to effect a 40 per cent. settlement with its creditors. A number of them already have accepted the offer and if the others are brought into line it is the intention to reorganize the company, giving the larger creditors stock in payment of their claims.

Death of Daniel C. Stover.

Honorable Daniel Carroll Stover, one of the foremost and the wealthiest citizens of Freeport, Ill., died at his home in that city, Thursday morning last, 16th inst., after an illness extending over nine months. At the time of his death Mr. Stover was president of several companies, among them the Stover Engine Co. and the Stover Motor Car Co. He was in his 69th year.

Wagon Makers Choose a Manager.

Walter Wardrop, publisher of Power Wagon, has been appointed manager of the Commercial Motor Vehicle Manufacturers' Association, the foundation of which was laid during the Chicago show. Concurrently, Wardrop announces that the headquarters of the association will be established in Chicago and that "in the future it will conduct all national shows as well as all public demonstrations of industrial motor vehicles." The officials of the organization are: President, G. M. Weeks, Weeks Commercial Vehicle Co., Chicago; vice-president, Oscar Lear, Oscar Lear Automobile Co., Springfield, Ohio; treasurer, H. F. Hamilton, Rapid Motor Vehicle Co., Pontiac, Mich; secretary, J. E. Burke, Lambert Motor Truck Co., Anderson, Ind. Board of managers; the president, vice-president, secretary and treasurer, and G. V. Rogers, Mitchell Motor Car Co., Racine Wis; Hayden Eames, Studebaker Automobile Co., Co., Cleveland, Ohio, and H. C. Eddy, American Motor Truck Co., Lockport, N. Y.

Swetland Purchases "Motor Age."

The Motor Age, of Chicago, was this week sold to the Class Journal Co. of New York, which also publishes the Automobile Although the fact is common property in Chicago, and although A. B. Swetland is on the scene, H. M. Swetland, president of the Class Journal Co., at his office in New York, refuses either to confirm or deny the transaction. Mr. Swetland has owned a number of trade publications and has been very successful in their purchase and sale.

Harper and Elliott in New Positions.

H. B. Harper has resigned the management of the advertising department of S. F. Bowser & Co., Fort Wayne, Ind., to assume the similar berth in the Ford Motor Co., Detroit, left vacant by the resignation of E. Le Roy Peletier. Harper's place with the Bowser people has been filled by the appointment of B. W. Elliott.

Jamestown Medals for Manufacturers.

The awards made to the automobile exhibitors at the Jamestown exposition were as follows: Gold medals, Dayton Motor Car Co., Stoddard-Dayton car; Reo Automobile Co., non-stop car; Studebaker Bros. Mfg. Co., automobiles, street sprinklers wagons and trucks. Silver medal, Haynes Automobile Co., chassis.

Elderkin Electrical Incorporates.

To take over the patent for an invention of James Elderkin, which is built around a compound for converting an alternating electrical current into direct current, the Elderkin Electrical Co. has been organized at Denver with $100,000 capital. The company expects to establish several charging stations in Denver.

G & J Philadelphia Branch to Move.

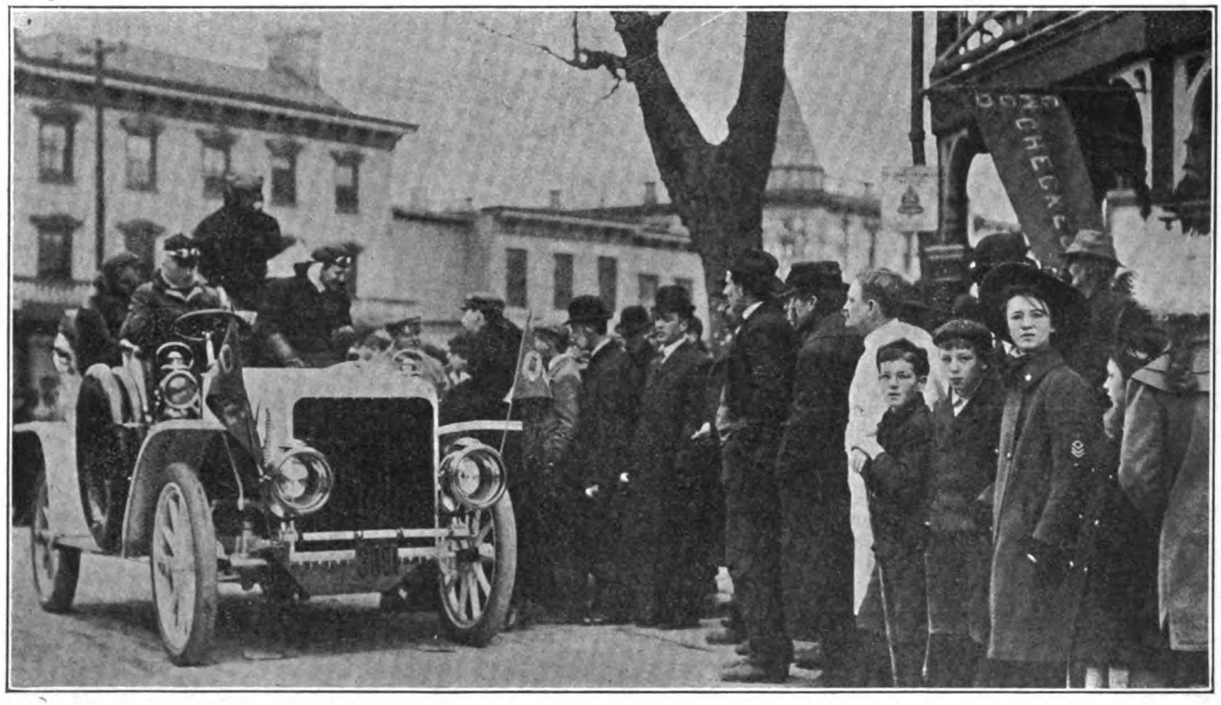
On February 1st the G & J Tire Co's Philadelphia branch will be removed to 713 North Broad street, next door to the place it now occupies. The new store will afford a corner location and about twice as much room as the present quarters.

MORE CARS FOR NEW YORK CITY

But Only One Permits of Competitive Bidding—Four Others to be Purchased by Private Arrangement.

The New York Police Department is in the market for a four-cylinder, five-passenger gasolene touring car of not less than 24 horsepower. Bids for it will be received up to 10 o'clock next Monday morning, 27th inst., and, what makes the matter of moment, there appears to be no "joker" in the specifications which will confine the bidding to one manufacturer. The nearest approach to anything of the sort is a provision requiring that the engine shall be fitted with a governor, which, small as it is, will greatly serve to restrict the competition, as comparatively few engines now employ governors. The specifications are unusually far-reaching also in that they require even a guarantee of the physical properties of the steel, as follows:

"Nickel chrome steel shall be used for axles, crankshafts, all shafts, all gears, and all other important parts. Its composition and properties shall be as follows: Chromium, 1.40; nickel, 3.30; carbon, 0.30; silicon, 0.26; sulphur, 0.015; phosphorus, 0.013; manganese, 0.40. Tensile strength: Untreated not less than 110,000 pounds; elastic limit, 95,000; extension in 8 inches, 16 per cent.; contraction, 60 per cent. Each bidder shall submit with his bid a guaranteed analysis and test of the steel used for the above purpose For unimportant parts, steel carrying as much as 0.025 prosphorus will be accepted."



In the matter of accessories to be provided with the car, the specifications call for remarkably generous tire equipment—rear tires, 5 inches—and these "spares": one extra front and one rear casing and four extra inner tubes for both front and rear casings—a provision which will apparently considerably reduce the cost of actual maintenance of the car.

It is understood that the specifications that apply in this instance were drawn with the view of making them the city's standard.

The New York Charities Department also desires four automobiles, but they are not to be bought in the open market as is the police car, that is, not unless some one makes himself heard in opposition to the present plan to purchase the vehicles from some official favorite. The four charity cars will cost $14,000, and although the city charter prohibits the purchase of anything exceeding a value of $999, without public letting, the obliging Board of Aldermen on Tuesday last found a loophole and authorizing the expenditure of the $14,000 in a private deal. The charity department presented the naive argument that "satisfactory machines cannot be purchased except privately."

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

White Wins Quaker City Endurance Run

In the endurance run held January 1-2 by the Quaker City Motor Club, the White Steamer was the only car which made a perfect score on the road and also was declared by the Technical Committee to be in perfect condition at the finish. The Contest Committee would not abide by the decision of the Technical Committee. They gave credit for perfect scores to two other cars and ordered a "run-off."

The supplementary contest, held January 4th, served only to emphasize the superiority of the White. The examination then made by the Technical Committee placed the White far in the lead and, accordingly, the MacDonald & Campbell trophy was awarded to the White.

With our entry of but one car, we decisively defeated 27 gasoline cars representing 23 different makes. Thus has another important victory been added to the long list of triumphs achieved by the White—the distinctively American car.

Street Conditions in New York.

A "Warning to Automobilists" sent to the daily press of New York City by the Automobile Club of America suggests that the municipal officer responsible for the pavement of the streets has not profited by the lesson that was intended when Governor Hughes removed the Borough President because of his failure to properly administer the business of his department in that he failed and neglected to keep the thoroughfares in a condition fit for traffic.

In their "warning" the A. C. A. specify twenty of the prominent streets to be avoided, because of holes in the asphalt, a condition which suggests the return to conditions that prevailed a year ago when the course of an automobile presented the appearance of a ship without a rudder as the machine was steered all over the streets in the desire to prevent broken wheels and axles, as well as to preserve the comfort of the occupants.

Is the re-elected Borough President entirely incompetent or is it merely a defi to the power that removed him?

Labor and the Commercial Vehicle.

While the labor problem is commonly held to be the chief stumbling block in the way of the immediate acceptance of the commercial vehicle by a wide variety of users, it is not as readily to be seen that no more resistance should be offered to commercial progress in that quarter than in the ordinary affairs of the business world. The fact that it is difficult to secure the services of treasurers who are honest and faithful in the performance of their duties, never has deterred concerns handling large monetary interests from electing men to direct the operation of their funds. The difficulty of securing good cooks never has driven the patient housewife into the kitchen, nor her husband to the restaurant. New obstacles merely introduce new methods of overcoming such hindrances to advancement, and the world at large recognises the ability to develop men in equal measure with the development of their duties as one of the greatest assets of the successful executive.

"It is a sign of administrative weakness for a concern to advertise its inability to compel its operatives to attend to duties which other concerns succeed in having performed without much difficulty"—is the terse comment of one power wagon user regarding another's abandonment of his automobile service because of the difficulty of securing efficient attendance. It is perfectly true without doubt that the causes leading to the relinquishment of a substantial investment in commercial rolling stock were in this case the same as have led to enormously disproportionate maintenance charges in other cases, and have gone a long way toward hindering the advancement of the commercial vehicle propaganda. But to discharge the horse simply and only because of the ignorance of its driver is a piece of ill-logic which should never be tolerated, and savors of a mismanagement which, except in a novel system such as that of motor traction, would not be countenanced anywhere.

The entire commercial vehicle problem at present is overshadowed by the stigma of its novelty—a stigma which prevents business men from applying to it the close analysis which they are accustomed to using in other departments of their business. If the labor problem is the greatest drawback to the successful adaptation of motor traction to existing business conditions, then it is the labor problem which must be faced. But it is pueril to regard it in any other light than as a labor problem, or to discard the system as useless when its application is known to have been faulty.

Block the "Private Arrangement"!

The City of New York finally having formulated specifications, which, save in respect to engine governors, permit open bidding on automobiles required for municipal use, on a fair and equitable basis and which, at the same time, assures the selection of high grade cars, it should be some one's or some organization's business, to insist that $14,000 of the taxpayer's money shall not be handed out for the private purchase of the four automobiles required by the Charities Department.

It is true that the commissioner of that department is very anxious to make his "satisfactory" selections privately and that the Board of Aldermen has authorized him to do so, but those most concerned should not sit supinely and permit the "deal." Loud protest against the payment of the $14,000 should prove effective in blocking the "satisfactory" private arrangement. The amount of the contract is sufficiently large to make it worth working for.

Motor Wagons for Farmers.

"A revolution in pleasure, a revolution in business, a humanitarian revolution"—is the manner in which an enthusiast hails the automobile. To quote the eulogy a little further: "The railroad put a stop to stage coach inhumanities. The electric street cars put a stop to the inhumanities of city travel. Who sees a jaded team, lashed and beaten up a slippery grade with an inhuman load, but he wonders that popular sentiment does not demand the use of auto-delivery wagons. Why should a farmer keep two or three teams and slowly drag his produce to market when one automobile farm wagon will do the work more cheaply and quickly in a human and moral way."

Why, to make a still more pertinent inquiry—why does not some one build an automobile farm wagon that will do the work of the farmer more cheaply and quickly in a human and moral way, than his two or three teams will do?

Granted freely and gladly the three sav-

Digitized by Google

ing graces of the automobile in a revolutionary way, and granted even more—that these are an accomplished fact and not a pleasant dream—the fact remains that at present the ordinary farmer has not a fair chance of replacing his horses and wagons with a perfectly suitable equivalent. He may invest in any one of a dozen or so of motor trucks any one of which is suitable for heavy duty under certain conditions, each of which is the product of good engineering practice, and each of which will replace from two to three horsed wagons if given a fair chance. But counting all the limitations to their service which a perfectly fair judgment must acknowledge, probably none of them offer inducements such as to make them very attractive to him for the routine work of the farm.

The farmers' automobile—the light vehicle especially adapted to rural use, is a present day reality and whether a permanent type or not, is finding favor with the rural user. The farmers' wagon must be built along the same lines, psychologically at least, in order to meet with an equally cordial reception. The motor buggy appeals to the farmer because first of all it is a buggy. The motor farm wagon must also be a wagon first and always, in order to meet with complete approbation in the country districts. Not that it must of necessity have the outward semblance of the typical farm wagon in every respect, but that it must be staunch and simple; that it must not constitute too much of an innovation in the vehicular line. The farmers' wagon must be able to negotiate the stubble field, the woods road, the cart track, and the sandy highway with equal impartiality, it must be safe in operation, not given to setting fire to highly inflammable loads, simple to maintain, and easy to understand.

The stack of discarded mowers, gas engines, threshers and pumps behind many a wayside barn and the idle windmills in the fields are monuments to misguided investment and inability to comprehend the requirements of machinery, which is lamentably prevalent. But it shows that a market for farm machinery exists, quite as well as the opulence of the reaper trust shows it. The rural attraction is a strong one on the market, but it is wiser to encourage its lasting development than to handle it with regard to present sales alone. The farm wagon proposition is beyond question a winning proposition. But it must be handled on a wagon basis, because the farmer thinks in terms of wagons and he must be approached in his own language.

Types that are Disappearing.

Considerable ingenuity is being displayed in the designing of vehicles to fulfil more or less specific purposes. The time when the automobile was sufficient unto itself simply because it was an automobile, is well passed. Also, it would appear that to a certain extent the convertible body is going out of fashion. That is to say, the balloon top and the demountable limousine are giving way to the full limousine and landaulet types, while the latter affords the accommodation formerly accorded by the types mentioned. The landaulet, as well as the runabout with folding rumble, are convertible to a certain extent, to be sure, but in a totally different way, since they are useable in either of two capacities at any time. It is the special car for the special purpose, which finds most favor at the present time.

Doubtless in the range of low and medium priced vehicles, there is and will be always, a demand for combination cars of one sort and another. Such machines must cater to the requirements of the user who is more or less cramped for money and must utilize his automobile in an economical and largely a business way. With the owner who is able to afford a better machine, however, the machine made for the purpose which is to furnish its use, is the machine which is likely to prove most attractive.

In catering to this sort of demand, the makers are acting not simply on the precedent of the carriage trade, but also with considerable wisdom. With a single chassis as a basis of construction, many different varieties of pleasure car may be constructed at comparatively low cost. A good range of types, gives the maker standing, increases his chances of pleasing the possible new customer, and further increases his chances of retaining the patronage of the old. Hitherto, much stress has been laid on mechanical improvement. This is no longer possible in the same degree, nor is it always advisable to play too strongly upon the occasional changes in design which may be thought necessary. Consequently much depends upon the discretion expended in choosing body designs, and though the trend of the market evidently is in that direction, it is well to emphasize the importance of a movement which is as certain as it is significant of changing conditions in the industry.

COMING EVENTS

February 1-8, Providence, R. I.—Show in Providence State armory.

February 3-8, Kansas City, Mo.—Kansas City Automobile Dealers' Association's annual show in Convention Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association's show in Central armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

Accident with a Possible Moral.

Despite its scientific banking, another spectacular accident has been added to the growing list of casualties on the Brooklands motordrome in England—this one being due to a cause so remarkable as to justify comment. The basis of the disaster which ruined the car and nearly cost its driver his life, was the bursting of one of the hind tires. Instead of behaving as most burst tires do, however, this one stuck to the wheel long enough to become wedged between the rim and the frame, thus locking the wheel and completely upsetting the control. After a prodigious evolution the machine landed on the far side of a roadway which tunnels the track and on its wheels. The unmistakable evidence that the performance was due to the wedging of the wheel rather than to any loss of control owing to the deflation of one of the tires, adds another item of proof to the theory that such accidents are seldom caused by tire deflation alone. But the possibility of locked wheels may come to be held as a strong argument against the use of large tires, or what amounts to the same thing, of body clearances less than the width of the tire. If this comes to be recognized as a real menace to safety, the lesson will prove to have been an important one.

NEW MATERIAL FOR LAW MAKING

Bunch of Bills Submitted to the Massachusetts Legislature—One of Them Provides for a Codification.

That the Massachusetts legislature will get busy, as usual, in tinkering the automobile laws was made evident long before that "Great and General Court" convened for its annual six months' job. In the shape of petitions, recommendations and formulated measures it already has a large supply of raw material on hand, while the committee hearings that undoubtedly will be given on some of the propositions will add to the volume. That some of the material will be raw indeed may be argued from past legislation on automobile matters in the old Bay State. At the same time, there is much that can be done to better the legal path of the automobile there, and some excellent suggestions are available for the steering of the solons.

The Safe Roads Automobile Association is responsible for no less than eight formulated bills which have been offered.

With the aim in view of reducing the laws relating to motor vehicles to a compact and consistant whole one of the bills provides for a codification. The automobile law has been amended so frequently that it is a somewhat difficult task to piece together the original enactments of 1903 and the subsequent changes. Two other bills are intended to perfect the law of the road. One provides that all vehicles shall carry at least one light from a half hour after sunset until a half hour before sunrise.

The second road bill of the Safe Roads Association provides that every vehicle must keep on the right side of the highway, whenever any other vehicle is in sight and whenever there is not an unobstructed view for at least 100 yards ahead; that no vehicle shall pass another going in the same direction unless the driver has an unobstructed view of the highway ahead and can pass without interfering with vehicles coming in the other direction. Under this bill all vehicles would have to keep to the right on corners and a vehicle coming in the opposite direction from that intending to pass would have the right of way.

The other bills have to do with the Highway Commission and in a general way increase the power of that board. One bill provides that the commission may summons witnesses and pay witness fees, a privilege which the governor has recommended and the commission itself has asked for, in order to make more effective its investigation of infractions of the law.

The Highway Commission in its annual report recommended that a law be passed whereby the Commission could have the assistance of the State police in making investigations. The Safe Roads Association goes further than this for it has put in a bill providing for the appointment of not more than four persons with powers of police officers, whose duty it shall be to investigate the causes of any accident in which a motor vehicle is involved, which results in the death of any person, and such other accidents as the Commission shall think it desirable to investigate. This bill, if passed, would provide the Commission with practically the same equipment for investigating motor vehicle accidents as the Railroad Commission now has for investigating railroad accidents, and the same sort of duty would be laid upon the Highway Commission as now rests upon the railroad board.

It is further provided in the bills of the association that the license of any operator who has caused the death of a person shall be at once suspended, and shall be revoked unless the Highway Commission, after investigation and hearing, decides that the accident occurred without serious fault on the part of the operator. A person whose license is so revoked cannot have his license renewed for at least six months, nor thereafter except at the discretion of the Commission.

It is also provided that the Commission may suspend and order delivered up the license of any operator whom it has reason to believe is an improper or incompetent person, or is operating improperly or so as to endanger the public. The Commission may reissue the license if upon examination it decides that it should be reissued, Under this provision it would be possible for the Commission to cancel any license and require an operator, private or professional, to pass an examination.

Still another proposed change in the law is that the license of any operator who is convicted in a court of operating recklessly or so as to endanger the public, or while under the influence of intoxicating liquor, shall be suspended until he is acquitted, if he appeals, unless the Highway Commission, after an investigation or hearing, decides to reissue it. This provision would not apply to overspeeding cases.

Other bills of the Safe Roads Association are intended to extend the provisions of the law which provides for fine and imprisonment in certain cases, to cover cases in which operators, after causing a serious accident to persons or property, run away without justifiable excuse, and to cover driving without displaying registration numbers, when such numbers were not displayed in an attempt of the driver to conceal the identity of his car. A further provision applies to cars from outside States and provides that during the seven days in which they may be driven in Massachusetts without being registered they must display the registry numbers of their home State substantially as provided in the law for display of numbers issued by the State of Massachusetts.

NANTUCKET AGAIN IN THE RING

Islanders Win First Round in Massachusetts Legislature—House Passes Bill Tending to Bar Automobiles.

Nantucket has entered the Massachusetts legislative arena for another bout with the automobile. The islanders, those of them who are afflicted with motorphobia, are possessed of that pertinacity which made them successful whalers in the days before the rock drill superseded the harpoon in the production of oil. They have had to take the count in several preceding bouts, in court and before the Massachusetts Highway Commission, but immediately after defeat they have gone into training for another go. This time they have won the opening round by securing the passage in the House of Representatives of a bill that emphatically is drastic.

This bill provides that the selectmen of Nantucket shall be authorized to regulate and prohibit the use of automobiles and motorcycles on any highway in Nantucket. This, of course, gives that board power practically to exclude such vehicles from the whole island, as the only terminus of the steamboat line plying to and from the mainland can be reached by no road not under the jurisdiction of the selectmen. The bill further provides that the decision of the selectmen shall be final, which, in effect, would place Nantucket roads beyond the jurisdiction of the State highway commission. That body, it will be remembered, is committed through its chairman, against any such entire exclusion of automobiles from the island as the selectmen of Nantucket have attempted, and this feature is a vital one in the bill.

The next round in the bout will be decided in the Senate, and it remains to be seen whether the forty men constituting that body will, in their concentrated wisdom, endorse the action of the House. It is doubtful. The House is a somewhat unwieldly body of 240 men, in which young city politicians and inexperienced rural legislators are two very conspicuous elements. The senators, as a rule, are men of large affairs, experienced lawyers, and legislators who have had some training for the work. They will be more apt to see that the Nantucket measure is special legislation of a mischievous character, and the bill, if it does not fail entirely, is likely to go back to the House greatly modified.

Worcester Wants Hill Climbing.

The Worcester Automobile Club, it is understood, intends again to put in its bill under which it hopes to revive its hill-climbing contest on Dead Horse Hill or elsewhere. This bill gives town or city authorities the right to close roads on which automobile contests are to be held.

Digitized by Google

SAVANNAH AWAITS THE ENTRIES

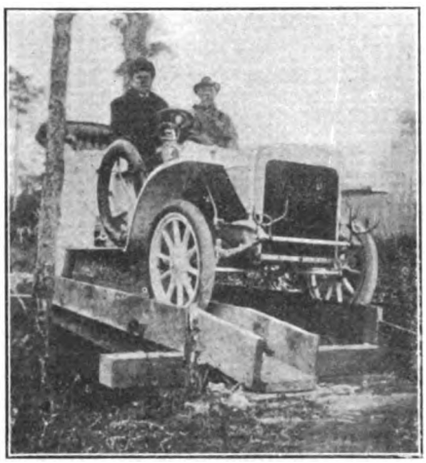
Thirty Required to Assure the Three Stock Chassis Races—Local Enthusiasm for the Meet.

If thirty entries are secured before March 1st next, the proposed three stock chassis races of the Savannah Automobile Club will be held over a course near the Georgian city during that month. The dates selected are Tuesday, March 17th, and Wednesday, March 18th. Rules for the proposed meet were formally adopted by the Technical Board of the American Automobile Association this week.

Three events have been provided, as follows: for stock chassis with engines limited to a maximum piston displacement of 575 cubic inches, 360 miles; for stock runabout chassis with engines limited to 375 cubic inches, 150 miles, and for six cylinder stock chassis with engines having a greater piston displacement than 575 cubic inches, 150 miles. The long race is to take place on Thursday and the other two on the day preceding, that for runabouts in the morning. Unless fifteen entries in the long race, ten in the event for runabouts and five in the six cylinder class are secured, the meet will not take place.

There is nothing new or startling in the rules. They provide that no car shall be eligible that essentially is not a stock car, or rather a stock chassis, one that is so constructed that it can, by adding the necessary parts, be assembled into a complete car of its kind. Also that the car entered shall be subject to sale at the list price and orders be accepted by the manufacturer for any number of exact duplicates. The cars must be the product of a recognized manufacturer who during a period of one year prior to February 1st, 1908, shall have built not less than 50 cars of all models, of which not less than 10 per cent. shall have been manufactured of any model entered.

Although there is nothing unusual in the rules several features are manifest. One is that while the chassis may be stripped of lamps, lamp brackets, guards, guard irons, running board, irons and step, it must carry the regular stock hood, the loss of which during the race will result in disqualification of the car. In respect to the location of engine, transmission, dash, steering wheel and so on, the car must conform to standard equipment. The matter of exhaust is made optional with the entrant. It may be directed through the side of the hood or under the car, and in the latter case must be horizontally pointed backward, with the rear end sufficiently high to prevent throwing up dust.



To qualify for either of the three events a car will have to show that it can cover a mile over a substantially straight measured course, under official observation of a committee of three members of the Technical Board, at the rate of 45 miles an hour.

There will be no weight limit, the restrictions being in piston displacement as stated previously. The driver or mechanicien or both may be changed during the progress of the race, if necessary. All repairs and adjustments, including tire replacements, are to be made on running time and by the occupants of the car. No extra parts may be carried, excepting tires.

Manufacturers are limited to enter two cars in each event and the fees vary.

Road Improvement Work in Florida.

Thomas H. White, president of the White Sewing Machine Co., and the father of Windsor, Rollin and Walter White, of the

THOMAS WHITE AND HIS TRESTLE

White company, has recently been doing considerable work in improving the roads between St. Augustine and Ormond, Florida. Mr. White has a fine winter home at Daytona and frequently makes the trip to St. Augustine in his car. There are innumerable little creeks without bridges along the road and it occurred to Mr. White that suitable automobile bridges could be built across these streams at very little expense. Accordingly, he has contrived what has been dubbed by his neighbors "The Incomparable White Motor Car Trestle." This device may be described as made up of two troughs each consisting of a plank laid horizontally with a plank fastened on either side in a vertical position. The latter, besides strengthening the trestle, serve as guides for the wheels. The two troughs are connected by cross pieces which keep them the proper distance apart, this distance corresponding with the tread of an automobile. Since Mr. White engaged in his work of bridge building the automobile trip between St. Augustine and Ormond has lost all its terror and more tourists are making the trip than ever before. In addition to bridging the streams, Mr. White has had the laborers from his estate at work cutting down the branches and bushes which project into the roadway.

ENTRIES FOR THE LONG RACE

Promoters of New York to Paris Run Announce Ten Have Been Made—Schedule for Early Stages.

Although the complete details of the proposed New York-Paris race are as yet shrouded in beautiful uncertainty, the New York newspaper which has taken upon itself the burden of managing the American end of the affair, this week announced that ten "formal entries" had been secured, and that there are four other European and two American cars in prospect.

Of the number already said to be entered, four are American and are named as a Thomas, Maxwell, White and Hol-Tan. The other cars and country of manufacture are De Dion, Moto-Bloc and Sizaire-Naudin, of France; Italia and Brixia-Zust of Italy, and Porthos of Germany.

The New York promoters state that a meeting of the American entrants will be held in New York City this afternoon (Thursday) when they will discuss conditions of the long ride across the United States to Alaska, to Asia, and thence across Siberia, Russia and Germany to Paris.

Although there seems to be an undercurrent of opinion that the so-called New York-Paris "race" organized by Le Matin of Paris, the same newspaper that promoted the Pekin-Paris trip last year, will be called off at the last minute because of the lateness of the season and the consequent improbabilities of the cars being able to reach Nome before the melting snows commence to run, preparations are going on for the journey across the American continent. Several cities are preparing to welcome the explorers and the itinerary from New York to Chicago has been fixed.

A five day schedule has been laid out between this city and Chicago, and the run made so that the cars will keep practically together for that distance at any rate. The first day's run, as announced, will be to Albany, a distance of 148 miles. This will be the shortest of the trip, so arranged that a start may be made from New York at an hour late enough in the morning to enable the photographic brigade to take a sufficient number of snap shots to provide illustrated matter for some weeks. The second day's run will be to Rochester, 248 miles, and on the third day the night's stop will be at Cleveland, a distance of 271 miles, the longest of the five. The fourth day's run will stop at Waterloo, Ind., 204 miles, the first day bringing the tourists into Chicago, 162 miles, where the Chicago Automobile Club is preparing to "spread" itself."

No car will be allowed to leave Chicago before 9 a. m. Thursday, February 20th after which it is expected they will be permitted to go as they please to San Francisco.

Motor Cars as Mediums for Municipial Graft

Eighty Per Cent. of Their Use in One City is Illegitimate—Use Taxpayers' Cars and Chauffeurs as Conveniences for Officials' Families and Friends—The Frightful Narrative of One of the Chauffeurs Who Mistook the Profession but Who Kept a Diary.

Perhaps because his sensibilities have been dulled by long continued repetition of stories and instances of unfaithful or conscienceless service rendered by city officials or employes, the man in the street is too prone to accept that sort of thing as a matter of course. He presupposes that practically every man employed by a municipality owes his job to "political influence" and he does not look for faithful service from politicians. That such assumptions are not wholly true has small bearing on this story.

In a general way, this man in the street has become possessed of the idea that since automobiles came on the scene and were placed at the command of city officials and department heads that a new form of "graft" and unfaithfulness has been developed. Very many men identified with the automobile business are well aware that the evil has attained huge proportions and after two years spent in the automobile service of a large city, I feel quite competent to say that there is no form of city property that is so largely misused and abused or so generally and grossly and shamefully converted to private use as the automobiles paid for by a generous and long-suffering public.

Luxury at Public Expense.

With a few notable exceptions, these automobiles are to all practical intents and purposes, private equipages. I know that I am well within the bounds of conservatism when I assert that 80 per cent. of their use is wholly private use. There are some of the cars that usually contain a city official when "joy riding" is the pursuit, and its misuse thus is given the color of authority. But there are others that are as often used by the officials' wives, daughters, or friends. One of the most conspicuous commissioners of the city of which I write and who is a boon companion of the mayor himself, is one of the most notorious offenders in respect to this department of "graft." His family regularly uses the city's car and driver and fuel for shopping and for nearly all other pursuits of convenience and pleasure.

The cost of upkeep, that bugaboo of the motorist, never concerns these public servants. Their use of automobiles is ideal use! They buy whatever becomes necessary with a free hand and the city repair shop keeps the cars in "apple pie order." The cars are supplied free and no expense—to the users—thereafter attaches to their use If it were possible to obtain a truthful accounting of the cost of this phase of "municipal ownership," the figures surely must stagger the tax-payers who foot the bill.

The occupation of driving a city's car naturally affords an insight into the conditions that exist and it is my purpose to detail them as I found them. I say in advance, however, I do not see how any self-respecting and educated man can hold the position of chauffeur and retain his self-respect. I myself had a rude awakening in this regard, which I think makes it fitting that my first article should deal rather largely with the autobiographical and even egotistical and require frequent use of the personal pronoun, but for all of that, I think it serves the object of placing the job of "chauffeuring" in a light in which it has not previously been placed.

Status of the Chauffeur.

I frankly confess that there is a great deal of pride in my makeup—or shall I say self-respect?—for I have always held that no honest work is dishonorable, yet I cannot feel that the converse of that is true, that all honest work is honorable. For surely for one, to whom has been given the advantages of an education, whose parents have bequeathed a good name and the training which entitled him to associate with gentle bred folk and to be one of them, cannot in justice to himself, or in justice to those to whom he must make accounting of the stewardship of the talents entrusted to him, retain a position which society classifies or grades as menial, which requires a labor easily performed, a technical knowledge quickly acquired and involves a personal appearance of sufficient untidiness to preclude the possibility of sitting at table with those whose clothing is neat, hands free from dirt and grime and nails clean.

Now in using the word "society" I do not want to be construed as meaning that social set comprised of the idlers of fashion or any moneyed class; for I have ever had a humorous tolerance of them amounting almost to contempt. I have always thought of them with pity and known myself to be better than those who could not earn a living if thrown on their own resources, so when I say "society" I want to be understood as using the word in the sense of "that collective body of persons composing a community."

As a child I was given the usual education that is thought wise for the children of parents who have means: the general run of mathematics, English, modern and dead languages. I was not especially proficient in any branch and was remarkable only for a retentive memory.

From early childhood I possessed the quite common boyish trait of dissembling mechanical contrivances, and I could essemble as well. My toys, a clock or watch were made to reveal their reasons, then restored and continued in their intended capacities. In boarding school a small steam engine, obtaining its energy through a hose attached to the steam heating system, was a source of exquisite delight for many years; to be sure the engine was but a part of the whole, for by belt of thread miniatures were made to move and notes sent the length of the long hall, where at intervals the correspondents returned the replies. Batteries and small motors were also among the assets and served to develop an interest in electricity.

At college I made the 'Varsity nine in my freshman year, an evidence that athletics had found favor in my youth; the tennis championship came to me, and I did well in cycling and sprints. I entered enthusiastically into the life of my fraternity and took keen interest in a debating society of which I was one of the speakers. My mechanical tendencies were not strongly in evidence during my university life though several labor saving devices were to be seen such as an ingenious scheme of lowering and raising shades from my bed, of regulating the ventilation and extinguishinging the light when I had read myself into a condition of sleepiness. Then, too, there was an electrical alarm to warn me of the approach of sophomore invaders in time to escape through a window from their natural curiosity as to my ability to row, while seated in a wash basin of water with lead pencils for oars, to sing, declaim, etc.

Turning to Mechanics.

Finishing college with eyes much impaired from reading in bed and a fair record in studies, I accepted a position, offered by a friend, with a large electrical manufacturing company, where, starting at $3 a week I served a year as machinist's helper and in various grades until I became one of many "electrical experts" at seven dollars; I had taken the regular "student's course" and was considered equipped now to earn a livelihood. Another year devoted to yachting, riding to hounds, etc., with an occasional glance at a card table or wheel, was soon over, and I became linesman on a surveying corps of an important electric railroad, from

Digitized by Google

which work the change to a municipal position seemed but the following of a natural bent and I became a civil service employe in, say, the Leaks Department of—well, never mind the name of the city. It occupies a very large place on the map.

For two years the routine work of leaks department inspector furnished an endless source of interest.

The extent of my territory was so great that I was naturally interested in anything which promised transportation possibilities in place of the horse and carriage, or public traction companies. Because of this interest I had bought a motor bicycle and made it reveal to me its mysteries, my first contact with an explosive engine. By it and from it I learned of the jump spark and timing of valves and their why for, until I felt competent to handle a more ambitious vehicle.

Amateur Chauffeuring.

At this time there was stored in one of the city's stables a motor car which, having been a source of trouble to the commissioner, had been discarded and was forgotten as an asset of the department. I knew of its existence and asked for it for my own use. As my position would not warrant the expense of a chauffeur, the salary of his position being twelve hundred, whereas mine was but a thousand, I operated the machine myself, soon becoming able to get most satisfactory results, in fact, so satisfactory that the car with me as an operator was in frequent demand by officials of the department whose work did not justify the maintenance of a motor outfit for them; in consequence, I often became actually the chauffeur of my confreres, my own official identity being sacrificed to this new demand on my utility.

I am not sure but that the work I was now doing so frequently was more agreeable than my regular duty. On days when I drove for another I had no report to write out, and my eyes welcomed this relief, for frequently the evening hours were required for detailed statements of conditions observed or complaints answered. The freedom from confinement in an ill-smelling, poorly ventilated court room where much of my time was necessarily spent; the absence of "scenes" when we arbitrarily removed a "contagious disease" from protesting relatives to reception hospitals. The freedom from necessity of antiseptic baths after contact with disease; no sickening cellars or putrid privies, or any of the thousand disagreeable features which, after the novelty of the work wears off, are not compensated for by the humor or enchanced by repetition. As an offset of this was the grease which left its impression on the hands and nails, or clothing, and the dirt which seemed to cling to all over you when a tire had to be replaced.

My relations with the men I drove, my associate officers, had not changed because of my assumption of new duties and releasing myself from old responsibilities. We drove about from ward to ward, smoking, laughing, stopping at my home for lunch if in that vicinity, or at their homes if more convenient; at restaurants where one or the other discharged the reckoning, and at all times and in all ways the social condition was unchanged.

In the Regular Ranks.

Week by week the number of hours given to my regular duties became less and less until finally there was seldom a day when my own work was as important as my driving; when this condition arrived I began to give serious thought to the advisability of transferring to the mechanical department, where as a "gas engine expert" my salary would be two hundred better a year, and with no responsibility, or any of the disagreeable conditions consequent to the work of "Board Inspection," and my duties would be the same as at present. I thought of my social status and felt that it would not be altered by the mere fact that I was accepting twelve hundred dollars for services I had been performing for a thousand. To be sure, I would become a chauffeur, but a chauffeur for the municipality, engaged in city's work, a thing different from the groom or coachman, different even from a private chauffeur, who accepted tips, ate with servants and ranked between a secretary and a valet, above the coachman, less than the stenographer. Deciding to do it I sought the commissioner with my request for a transfer and explained my motives; his negative reply was, paradoxical, as it seems, very positive.

"Why," he said, "I can't pay twelve hundred for running an old clap-trap that isn't worth two hundred."

"But," I responded, "if I can get, as I have been getting for the past four months, as much service out of a machine not worth two hundred, as your chauffeurs are getting out of your modern expensive cars, am I not worth at least as much as they?"

He pondered a moment.

"Take me out this afternoon. If you can get results out of that machine, I'll transfer you." A few days later I was transferred.

From the first I enjoyed the new conditions. With sole charge of the car I found opportunity on rainy days to develop a closer acquaintance with it; I actually became fond of it with a fondness one sometimes has for things of close association; it became that curious thing we sometimes hear of but never see, an almost entirely reliable car, always ready, always going I seemed to know its whims and humored it and it repaid in kind. Then the finance bureau condemned it and at auction it became the property of a second-hand dealer who paid the sum of two hundred and forty for it.

Types of the Chauffeur.

While waiting for another car I spent my time in the department machine shop where was sufficient equipment for any work from turning down a crank shaft to cutting threads on a rivet. Now came my first opportunity of getting acquainted with my fellow employes. Of course, I had known them, even before I had become one of them, but my acquaintanceship was casual and even their names were not surely fixed in my mind. One was the best "ground getter" I ever have known. He was hard on his car; he used the emergency brake all the time, but his eye for distance was so acute that he would take at high speed an opening between trolley car and lamp post just wide enough to permit passage, leaving the padlocks from the side baskets on the street where they had been scraped by obstructions on both sides. It seems incredible, but it is true. I have seen him do as much. Socially he was unmentionable.

Another was about as good, but even more reckless—a harum scarum individual whom everybody liked. He kept his car in a condition requiring constant overhauling, and drove when so full of whisky that he had to be held in his seat. He has turned his car to avoid a collision when traveling so fast that the skidding tore off both rear tires, and this on a popular thoroughfare of a busy city, at the noon hour. He was ready for fight or frolic, had a keen nose for commissions on lamps, tires or spark plugs, and possessed political backing.

Another was a splendid fellow who had been forced from boyhood to earn his living; he was a machinist, a mechanic, a good careful driver, reliable and honest.

The "boss" of the automobile shop, though a chauffeur like the rest of us, had successfully bluffed the powers into thinking him so expert a shop hand that his services were required in that capacity. In point of fact, he could not cut threads on a bar or bolt and get them to size. Eventually they fired him, and in his place came a good machinist who quickly left to accept a better paying position, being succeeded by another, a delightful, quiet, competent mechanic, who brought order out of chaos and reduced expenses by making parts, instead of buying them, for the foreign cars.

And last, there was Gus, the Beau Brummel of the outfit—"Heiny," we affectionately called him. He was first a helper and later was made a chauffeur. He was the one who wore "clothes," who attended soirees, who called our attention to his figure, to the symmetry of his legs, the shape of his foot, to his muscle, in fact, to everything about him, until his conceit, which passed all understanding, actually endeared him to us for the amusement he created, one whom we otherwise would have found commonplace.

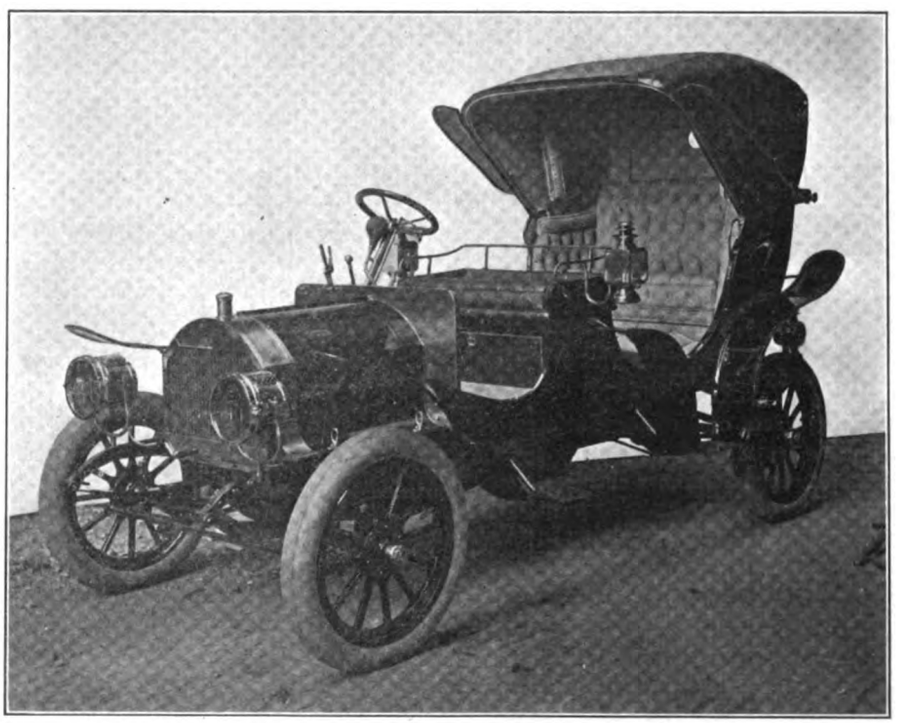
Such were my associates. Others had come and gone without leaving any impress of their individuality. Some were good; some knew nothing; one, who headed the civil service list before the position was

Digitized by Google

put in the non-competitive class—was certified to us for trial. He had trouble in starting a car on which two sections of the coil were broken down and accepted the suggestion of one of the men that the spark coil needed "charging," and took it to the master mechanic with a statement to that effect. Then he left.

A city election at this time gave us a new administration. We came under a new commissioner, and among his appointments was—call him an inspector, a young colegian who, fresh from his university, had made no attempt to earn his livelihood, though anxiously casting about for the field in which to begin. To him was assigned a low powered rear entrance tonneau car of old vintage, with a record of many miles to its credit, or rather history, and I was assigned with the car.

That my position may be better understood, I will explain that my evenings had always been spent at home, of which I was passionately fond. Literature and study were my pursuits, and I had never been required for work beyond four or five o'clock. Imagine then, if you can, the wonderment of my first day's work when at seven I was offered money with which to pay for my supper, while the superintendent and a friend went to a restaurant for theirs. The "tip" was declined and I waited with growing indignation for the next development. It came in about an hour, when with some of his friends, I took him on a round of clubs where presumably congratulations were the order. About midnight I stabled, and so ended my first day under the new regime.



The next morning we started again and scoured the city like a fine tooth comb, up one street and down another, into hospitals, police stations, comfort stations, halls, lodging houses and what not, until I wondered if the little 10 horsepower didn't want a rest. We kept this up until about four, when I drew up before a private dwelling, surmising what sort of affliction could have visited that home. Two hours later I knew, for the superintendent came out followed by a dainty woman whom he tenderly helped into the tonneau. I removed, at his request, the "D. P. L."—which may as well be considered as standing for Department of Public Leaks as for anything else—sign on my radiator and turned my course toward one of the largest of the downtown restaurants.

The young "inspector" was beginning to play the graft game early in his career. But this was merely the beginning. He "improved" amazingly as he went along. Of these "improvements" and other things I purpose telling next week. With the preparation of this article in mind and at the suggestion of the Motor World, I kept a diary for many months. It was kept faithfully enough to preserve the names of most of the deputy's friends, both male and female. It would be improper to term all of the latter ladies.

SMARTNESS IN A NEW VICTORIA

Latest Offering in the Stoddard-Dayton List an Attractive One—Mechanical Characteristics of the Vehicle.

An extremely neat and attractive victoria body, somewhat suggestive of the cabriolet in general outline, yet thoroughly a victoria in the luxurious appointment of its rear seat, is the newest offering on the rapidly growing list of Stoddard-Dayton cars. It has just been announced by the Dayton Motor Car Co., Dayton, O. It is known as the Model 8-X Victoria, which indicates that it is an adaptation of the chassis employed in the landaulet of the same characteristic, but owing to the complete alteration of its appearance under the new conditions it must stand as practically a new vehicle in every sense of the word. In its newness it also is thoroughly up to the mark in style. And style is fast coming to be an important factor in automobile body design, particularly as applied to vehicles destined for city use almost exclusively.

STODDARD-DAYTON VICTORIA

As the picture clearly proves, it is a vehicle of comfort first of all, in which the rear section is considered of prime importance. The use of the open-backed driver's seat in front gives a tinge of dignity to the vehicle suggestive of liveried servants and stately progress. The general outline carries nothing which can offend the eye and the effect while enough out of the ordinary to be noticeable, is not sufficiently striking to be objectionable.

The mechanical characteristics of the machine are: quadruple motor, with cylinders 3⅞ by 3¼ inches bore and stroke, rated output 18 horsepower. Transmission by selective sliding gearset and cardan shaft, rear axle of the full floating type. Three forward speed changes are provided, and both gearset and rear axle parts are mounted on Timken adjustable roller bearings. The wheel base is 101 inches, the road clearance 9 inches, and the wheel and tire sizes are 30 by 4, front and rear. Semi-elliptical springs are employed, both front and rear, the former being 36 and the latter 46 inches in length, both sets being 2 inches in width. There are the usual foot brakes on the transmission shaft and double emergency brakes on the rear wheels. The regular equipment includes a full set of lamps, together with generator, horn, and full supply of tools. The weight of the complete vehicle is only 1,400 pounds, which, considering the ratio of weight to power, should provide rapid acceleration.

To Avoid Vise Marks on Body Work.

Those who have had difficulty in holding the pieces tight in a vise without leaving vise marks, which are ineffaceable on finished work, should have two pieces of harness leather cut to the size of the vise and bent over it, so as to rest against the vise jaws and to hold in position. The leather will prevent the jaws from cutting into the wood or iron, and will hold the pieces sufficiently tight to finish them. For heavier work, where it is required to apply more pressure in order to obtain a better grip, the common soft brass or lead jaws are more suitable.

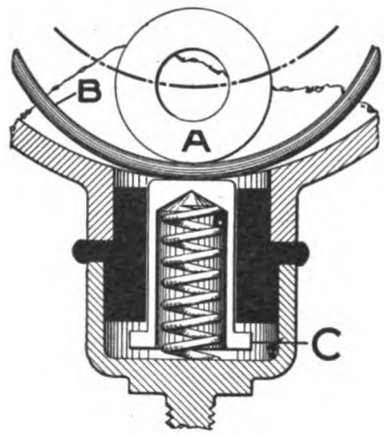
Shrinkage of Wood When Dried.

Interesting experiments on the shrinkage of wood due to the loss of moisture have recently been completed by the United States Forest Service at its timber testing station at Yale University. These experiments show that green wood does not shrink at all in drying until the amount of moisture in its has been reduced to about one-third of the dry weight of the wood. From this point on to the absolutely dry condition, the shrinkage in the area of cross-section of the wood is directly proportional to the amount of moisture removed.

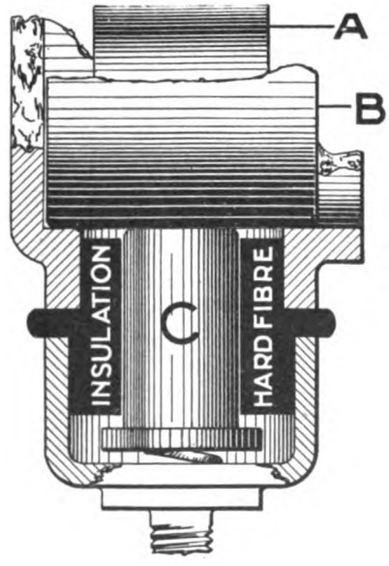
The shrinkage of wood in a direction parallel to the grain is very small; so small in comparison with the shrinkage at right angles to the grain, that in computing the total shrinkage in volume, the longitudinal shrinkage may be neglected entirely.

The volumetric shrinkage varies with different woods, being about 26 per cent. of the dry volume for the species of eucalyptus known as blue gum, and only about 7 per cent. for red cedar. For hickory, the shrinkage is about 20 per cent. of the dry volume, and for long leaf pine about 15 per cent.



In the usual air dry condition, from 12 to 15 per cent. of moisture still remain in the wood, so that the shrinkage from the green condition to the air dry condition is only a trifle over half of that from the green to the absolutely dry state.

Lessening Wear on Braking Surfaces.



Though most drivers complain loudly of the rapid wear of braking surfaces, comparatively few of them make it a practice to clean off the drums after coming in from a run over muddy roads and after the machine has been taken from the wash rack. The drums, no matter how well protected by cover plates are bound to accumulate a greater or less amount of plain unalloyed mud under such circumstances, and the result goes a great deal further in accounting for rapid deterioration of the metal than any legitimate wear can do. It is a simple matter to flush out the brakes when mud and water have been abundant and to pour in a few drops of oil which will prevent rust and counteract any tendency to grinding when the car is first started.

Wico "Ring and Roller" Timer.

In the design of commutators it is the constant aim of the maker to do away with the effects of wear as far as possible. The plain roller contact was thought to be a great step in the right direction, if not the final thing, but in adding to the roller a loose ring through which the contact is made, the development of the new Wico "ring and roller" timer has been carried a step further in the same direction. The ring and roller timer is the latest development of the Witherbee Ignitor Co., 541 West Forty-second street, New York City. In a general way it follows the principle of the ordinary roller timer, but its action is considerably modified, and the purpose of the roller entirely changed by the adoption of the ring, which rolls around the inside of the timer casing under the influence of the roller and constantly presents a changing point of action to the current at the contact points. The effect of mechanical and electrical wear are thus materially reduced and the life of the device is prolonged.

The diameter of the ring, B, as illustrated in the accompanying picture, is greater than that of the orbit of the roller, A, so that a slight planetary action is set up, and in consequence, the points of contact on the ring are constantly changing. The insulated pole comprises a tool steel plug, held toward the inside of the casing by a brass spring and retained by a shoulder in such a position that its point just projects beyond the surface of the casing and in the path of the traveling ring. As the ring approaches, the contact plug is depressed and contact is made between it and the casing on both sides, a large area of contact and a firm union of the parts thus being assured. The rolling action, distributes the arcing tendency at the instant of break, and prevents burning either of ring or point. The ring, which is the only part susceptible to wear in any degree, may be replaced readily and at small cost.

Causes of "Bubbles" in Varnish.

Bubbles which occasionally appear after the varnish has been applied to bodies five or six hours are in reality not bubbles at all, but represent a seedy or specky or sandy condition of the varnish, due to a number of causes enumerated as follows: Imperfectly cleaned surfaces, or surfaces varnished over when located in a damp or cold room, or when colder than the varnish itself. Using a varnish that through exposure to the air for any unreasonable period of time has skinned over, particles of the skin having become mixed with the varnish; also using an unripe varnish, that is, a varnish that has been unloaded on the consumer before it has sufficiently "aged" in the maturing vats of the manufacturer. Again, using a varnish that had been chilled during shipment, thus causing the driers to separate from the other ingredients. A lousy or dirty varnish brush will develop the "bubbly" or specky surface.

Defective systems of manufacture, by virtue of which particles of the gum separate on cooling, and for a long time remain suspended in the varnish, are even in these advanced days the head and front of the specky varnish.

Exposure of the varnish to the air will occasionally cause the sanded appearance often mistaken for minute bubbles, and it develops through the operation of a chemical law. High-grade varnishes, as experiments have shown, absorb moisture easily through exposure to a damp or moist air, during application to the surface, or preceding application, and this moisture chemists have long since explained forms with the turpentine a crystalline hydrate, which separates in small grains, having upon superficial examination the precise appearance of bubbles, but which upon thorough inspection, under a glass if necessary, will be found to be crystals of matter. Some one of the above causes is at the root of the trouble described by many owners of new cars, though the particular cause cannot always be easily cited off hand.

Rambler Record of Full Time Work.

There is one factory in the industry that has not felt the depression of this or any other year—the Rambler factory in Kenosha, Wis. Thomas B. Jeffery & Co. report that it has never missed a full working day in its eight years' existence, which in these times is a boast to be proud of.

Thomas Books Taxicab Orders.

The E. R. Thomas Motor Co. report having booked an order for 50 taxicabs each from New York and Chicago parties. An order for 100 cabs from a New York company in process of formation is in prospect.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

DEVELOPING THE CARBURETTER

New Foreign Types Embodying Some Original Features—Compensating Devices Show Most Originality of Idea.

After all the peculiarities of the internal combustion engine have been considered severally and in detail, the fact remains beyond question that none of them furnish more food for thought or perplex the designer more deeply than does the problem of carburetter those who prefer orig- signers are fairly quiescent in this respect, many builders relying on commercial types of carburetter and those who prefer original designs sticking pretty closely to types already well known. This is not the case with foreign constructors, however, the last

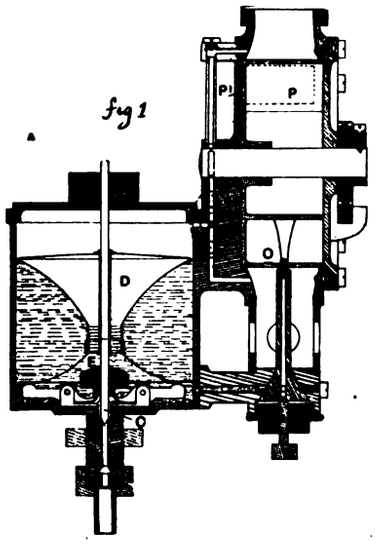

fig 1

few months having developed an astonishing amount of new thought in this field, and an equal amount of new material in the way of types, described in the local prints. Some idea of the wide range of development possible with the jet type alone, wherein the sole claim for originality must lie with the compensating device, may be obtained from a cursory glance at a number of these carburetter novelties of the more authentic and plausible sort.

One such, in which a commendable idea is found in the arrangement of the time-honored float system, is the new Gillett-Lehmann, an English device, shown in Figs. 1 and 2, wherein it will be observed that in place of the usual cylindrical float a conoidal section has been chosen, the upper portion, D, serving for purposes of floatation, while the lower section, E, actuates the weights of the needle-valve system controlling the valve, C. The float chamber is made of unusually large capacity for the pur pose of supplying enough fuel for some little running in the event of the main supply being cut off. In this way where gravity feed is employed, steep hills of considerable length may be climbed without danger of starving the carburetter.

The object in adopting the conoidal section for the float is to increase its sensitiveness beyond what is possible with the cylin-

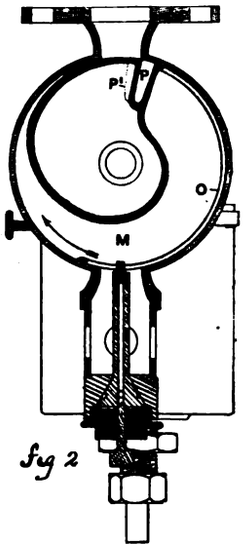

fig 2

drical form. It will be evident that as soon as the fuel level in the chamber begins to fall, a relatively large portion of the float will be uncovered, the decrease in bouyancy accelerating rapidly as the level falls so that the opening of the valve must be almost instantaneous upon the slightest diminution in the quantity of fuel in the chamber. Per contra, the valve must be closed with equal suddenness when the fuel level reaches its normal at the top of the float. The inverted conoidal shape of the

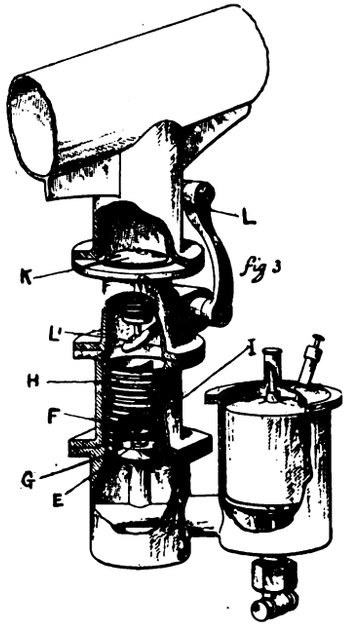

fig 3

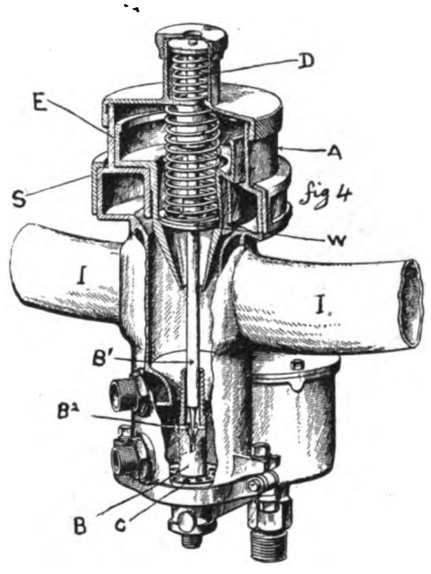
base portion of the float gives it a dashpot effect.

The second illustration shows the mixing chamber and throttle, the latter, which is snail shaped, having been used on a previous type by the same makers. Among its particular virtues may be mentioned the fact that the wall, C, containing the air port through which the atmospheric component of the gas is admitted around the jet, M, is so contrived that when the throttle is fully opened the air supply may be practically cut off. This position, of course, is used only for starting. Furthermore, when the throttle is quite closed, a port, P, comes into registry with a second port P1, in the casing, thus admitting pure air to the cylinders when the car is coasting or the engine is being used as a brake.

Another British device, which though not strictly new, yet possesses rather novel features both in its throttle and regulator valves, is the Chenard-Walcker. Here the float chamber and its contents, as well as the jet with its cone-shaped and ridged baffle plate, E and F, Fig. 3, are of familiar form. The air supply is drawn upward



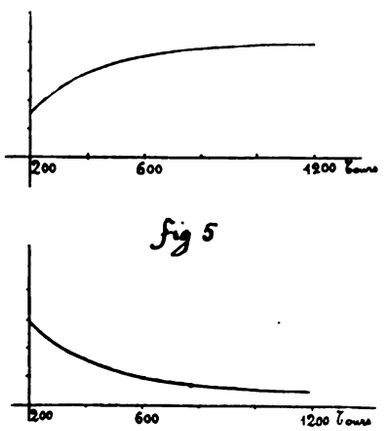


fig 4

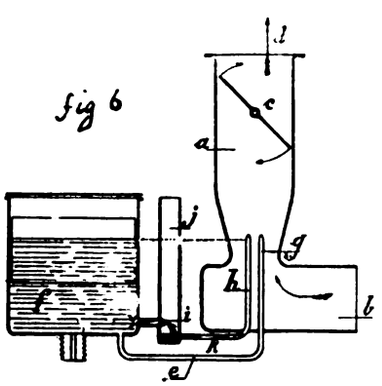
through the annular opening, G, around the jet, the complete mixture rising thence into the hollow, corrugated, piston, H, which carries the slender needle valve, I, thereby regulating the gasolene constituent of the gas. An in-turned annular flange at the base of the piston forms a throttle upon the air and also causes the part to be elevated as the draught through it increases. Thus the movement of the piston effects the complete regulation of the gas as to quality. Quantity regulation rests entirely in the poppet throttle valve, K, which is normally held to its seat by means of the stout helical spring, K1, and may be lifted by means of the lever, L-L1, when desired. As the valve opens, the draught in the tube below is increased, and the piston raised proportionately, thus compensating for the higher running speed condition. The lever L is under foot control and is constantly used in running the engine. Two small holes in the face of the valve, however, permit starting and slow light load running without unseating the throttle.

Another ingenius method of double compensation is found in the new Westing-

Digitized by Google

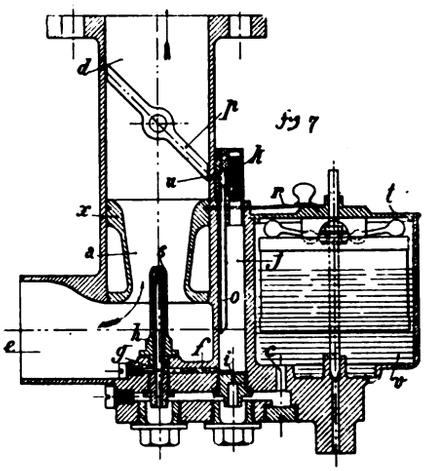
house carburetter, shown in Fig. 4. In this, the more ordinary method is adhered to, of admitting the main air supply from below and the diluent, used for compensating the gas at high speeds, from above. The jet, B, has horizontal orifices, B2, opening directly into the mixing chamber, into which the principal air supply is directly admitted from beneath by the holes, C. The auxiliary air valve, E, is located at the top in the annular chamber, A, and is of stepped construction, terminating below in a conical portion which extends downward for some little distance. The cylindrical head is



lifted by the pressure of the outer air as the speed of the motor increases and the interior of the carburetter experiences a partial vacuum, thereby permitting air to enter through a series of ports surrounding the chamber, S, whence it passes downward by the conical portion of the air valve toward the jet. The opening of the valve enlarges the annular opening between its lower portion and the walls of the regulating chamber also lifting the needle valve, B1, and admitting more fuel to the jet. The extra air passing downward, meets the upward flow from the main orifices in the base creating a sharp swirling action about the jet openings, and is finally delivered to the manifold pipes, I-I, through an annular passage surrounding the regulating chamber, wherein is located the throttle sleeve. The movement of the main valve is resisted by the main spring, W, while a second and lighter spring, D, mounted in a compartment at the top of the carburetter, opposes it somewhat and steadies the movement of the valve.

The most unique of these examples, however, is that developed by a French inventor, M. Baverey, in the Zénith. As in all other instances, the object has been to "furnish a uniform mixture regardless of speed and load conditions in the motor." If the quality of the gas be represented by a diagram in which motor speeds are measured on the base and the relative quality of the gas, vertically, evidently the perfect carburetter would be characterized by a straight horizontal line. The characteristic of the plain jet type, is shown roughly in Fig. 5, in the upper portion of which the natural tendency to enrich the mixture as the speed increases, is clearly brought out. In theory, the compensation required to produce the desired straight line, must take the form of the lower of the two curves, which is so drawn that if superposed upon the other the compound of the two curves would be a horizontal line.

In the Zénith carburetter, an effort has been made to compensate the mixture by annexing to the plain jet carburetter a second and supplementary one the characteristic of which shall follow the line of the lower curve in Fig. 5. The method of construction is shown diagramatically in Fig. 6, in which the regular float system, f, the main jet, g, the air intake, b, and the throttle in the upper part of the mixing chamber, a, are perfectly regular. A supplementary chamber, j, into which fuel is admitted freely through the regulated opening, i, is open above to the atmosphere, and below through, k, to the second jet, h. Under ordinary circumstances, it is evident that the fuel flowing from the float chamber will find its level in the chamber, j, but that owing to the free access to its surface of the air, as well as to the reduced length of the tube leading to its jet, its delivery must be considerably greater than that of the main orifice, when the motor is first started, or is running very slowly.



As the motor speed increases, the delivery from the second jet soon becomes so rapid as to exhaust the supply in the secondary chamber, j, so that only as much fuel can flow from the jet, h, as may pass the small regulated opening, i, in the wall of the float chamber. The delivery from the main jet, on the other hand, is accelerated with the increasing suction at high speeds, so that the tendency is to equalize the quality of

the mixture throughout the entire range of speed.

In Fig. 7, the device is shown in working detail. The main and supplementary jets are made concentric, the secondary element being the outer. Eliminating this, the carburetter will be found to be of elementary type, but minus any extra air valve connecting with the mixing chamber. The small port, i, admits a small and predetermined amount of fuel to the vertical chamber, j, which is open to the atmosphere from above, but protected from dust by a screen k. The fine bore, f, leads the supplementary fuel to the outer tube, s, surrounding the main jet, h, and the general action is ordinarily as indicated in the scheme just outlined. A small tube, o, however, leads from a point part way up the secondary chamber, j, to a point in the intake pipe, u, where it communicates with the interior of the latter when the throttle is open, but is cut off when the throttle is closed.

This device serves a two-fold purpose. When the motor is at rest, the chamber, j,

fills with fuel to the same level as the float chamber, so that the bottom of the tube, o, is submerged. When the motor is started, the suction in the small tube, o, becomes very strong; so strong, in fact, that a small quantity of fuel is injected directly into the mixing chamber at the throttle, instead of being carried around through the jets, the effect being that starting is made possible without flooding in the usual way. Similarly, when the motor is turning so slowly that an insufficient quantity of fuel is lifted from the jets to form a suitable mixture, the level in the supplementary chamber becomes high enough to allow a small quantity of fuel to be drawn through the tube, o, thus priming the intake. The flat spring, r, serves the double purpose of clamping in place the cover, t, of the float chamber and locking the Venturi cone, x, in position in the mixing chamber, a.

Leaks in Flanged Connections.

One of the most fruitful causes of leakage in flanged pipe connection arises from the careless habit of many mechanics of drawing up the bolts unequally when assembling the motor. It is a simple matter to gauge the tension of the nuts closely enough for all practical purposes by observing the movement of the wrench and giving the same number of turns to all the nuts. At the same time, careless manipulators if unwatched, will frequently set down one nut as far as it will go, drawing up the others in the same way afterward, thus skewing the coupling and straining the flanges far beyond their natural capacity without a tight joint.

FRAMING NEW LAW FOR NEW YORK

Proposed Provisions for New Enactment in the Line of Uniform Legislation—Graduated License Fees a Feature.

Although it appears to have escaped public notice at the time, action was taken last week by the Board of Aldermen of New York City on a portion of the Mayor's recommendations in regard to the use and abuse of automobiles in the city. The most radical and alarming provision called forth in this connection is that requiring all motor vehicles to come to a full stop before crossing an intersecting street or avenue on which a surface railroad is operated. In the matter of automobiles used for purposes of hire, whether the so-called sight-seeing vehicles, or cars of smaller capacity, a schedule of licenses is established, covering both the vehicle and its driver, while the provisions affecting cabs and carriages used for hire in the city are made to apply to motor vehicles so used. This action was taken at a meeting of the board on Tuesday, 14th inst., when the regular annual revision of the city ordinances was brought to a conclusion, and the necessary action was taken to make the work effective.

No record appears of any action upon the Mayor's recommendation in regard to the use of siren horns in the city, or to the use of muffler cutouts, the emission of smoke from exhausts, or the curtailing of the use of acetylene headlights within city limits. The licensing provisions, however, are complete and specific.

The clause affecting the control of cars at the intersection of streets on which street railway lines are laid, comprises merely a single sentence tacked onto section 555, Article 7, Chapter 13, of the "Rules of the Road." The body of the section relates to the requirements of stopping on signal from the drivers of restive horses or other domestic animals. The addition says that "Every automobile or motor vehicle shall come to a full stop before crossing an intersecting street or avenue on which a street surface railroad is operated." It will be observed that the requirement contains no stipulation as to the presence of cars on the tracks at the time.

The ordinance affecting the use of motor vehicles as public conveyances appears as a separate section of Chapter 8, under Article 3, relating to special regulations and rates. The text of Section 373 entire, is as follows:

"The Mayor of the City of New York shall, from time to time, issue licenses, under his hand and seal, to so many and such persons as he shall think proper, to keep for hire in the said City, automobile coaches, carriages and cabs, not seating more than four passengers, excluding the driver or chauffeur, in all, designed for propulsion by electricity, gasolene, or similar motive power, and may revoke any and all of said licenses for cause.

"The provisions and penalties of the ordinances of said City of New York relating to the licensing of hackney coaches or cabs, and of drivers thereof, and to rates and prices of fares, so far as the same may be consistent, shall apply to coaches, carriages and cabs to be licensed hereunder, and to the owners and drivers thereof.

"Every such automobile coach, carriage or cab shall be equipped with a bell or horn, to be used to signal its approach to pedestrians and to other vehicles.

Section 374, controlling the operation of motor vehicles of greater seating capacity than the above, reads as follows:

"No automobile carrying more than four passengers for hire, including sight-seeing automobiles and power vehicles of every description, shall take up or carry any person for hire, unless duly licensed so to do. The fee for such license shall be estimated on the basis of the seating capacity of such automobile, as provided in Section 351 of these ordinances. The Mayor shall also issue an annual license to the driver or chauffeur of any such automobile, the amount of which shall be one-quarter of the license fee for such automobile; but in no event shall the amount paid for such chauffeur's license be less than $10 annually."

Under the section governing the granting and regulation of licenses the word "chauffeurs" has been inserted, while the subsequent clause fixing the amounts of licenses for vehicles plying for hire, it is provided that "For each public automobile having more than four seats for passengers, for each seat thereon," the annual annual license fee shall be $1. For each public hack or automobile hack having not more than four seats for passengers, the license fee is $3 per year.

Buffalo Plans Exorbitant License Fees.

Having been defeated in its efforts to tax all motor vehicles Buffalo, which evidently needs the money pretty badly, has determined to mulct those who operate and maintain motor vehicles for public hire. By the ordinance drafted by the city attorney for approval by the Board of Aldermen a sliding scale of taxation is outlined that will doubtless not be received with any manifestations of great joy. If passed by the city fathers a sight-seeing car carrying 30 passengers will be "squeezed" for the small sum of $450 yearly, while a touring car carrying eight passengers or less will be required to pay $35 for a license; touring cars carrying more than eight passengers will have to pay $15 a head. "Barkers" or touring car solicitors will be compelled to give up $25 each yearly. The tax on public freight transporting motor vehicles is fixed at $25 each. It readily can be seen that the shakedown, if approved by the Aldermanic Board, will yield a very large revenue.

MUST STOP AT TRACK CROSSING

Remarkable Requirement Quietly Enacted by the New York Aldermen—Other New Provisions in the Ordinance.

In the general effort being made for uniform automobile laws, New York automobilists will not be last in attempting to secure that legislation which they deem best suited to their needs. Charles Thaddeus Terry told a Motor World man this week that he expected to have his uniform automobile bill drafted within a few days and that it will be introduced in the New York State legislature as soon as possible, probably next week. It first will be referred to the special committee on legislation of the New York State Automobile Association, of which Mr. Terry is chairman, after which it will be sent to the legislature.

While its provisions have not been made public as yet one of the features will be a sliding scale of taxation based upon the weight and character of the vehicle, and it is thought that an effort will be made to have all the money thus derived apply directly to the building and maintenance of State roads. According to report it is proposed to divide cars into four classes—light runabouts, light touring cars, medium touring cars and heavy vehicles. The fees will be $2, $3, $4 and $5, respectively.

While this bill is being put into shape for introduction the law makers, pursuing their annual custom, are busy. Already three bills have been introduced. The first of these was presented by Assemblyman Frederick Northrup of Poughkeepsie. Mr. Northrup introduces the same bill with annual regularity and it as persistently "dies" in committee. The representative from Dutchess county would tax all automobiles $5 a year to be devoted to the repair of the highways.

Patrick J. McGrath of New York, being a new assemblyman, sought to make a fashionable debut, by introducing a bill to compel automobilists to stop and give their names and addresses and the name and address of the owner of the car when a person or property is injured.

The latest effort in this direction was made on Tuesday by Senator John N. Cordts, of Kingston. The upstate legislator wants "automobiles fitted with automatic lamps that will throw the light straight ahead and thus do away with the full light that goes in all directions and blinds people as the cars approach."

Despite the "well-meant" efforts of these legislators it is likely their bills will die the usual death when the uniform bill, being drafted by Mr. Terry, is introduced. That, too, may meet the same fate, but it is not thought likely as there will be no radical departures to cause objection, it is stated.

PEELING OF PAINT IN WINTER

Causes of a Frequent Evil that Mars the Appearance of a Car—Some Ways of Obviating It.

The peeling of paint from springs, axle beds and other metal parts of carriage gears has furnished the painter at one time or another with days running over with trouble, but the larger share of this trouble, if seasons could be specified in detail, has come, we take it, during the cold months of the year, and, to be more definite, during the coldest days of these cold months, says Carriage Monthly.

It is known, naturally, that the peeling of paint occurs in the summer months, and during those yearly periods when we have every reason to expect paint to stay exactly in place, but such peeling, in the main, is due to errors or neglect for which, apparently, it is hard to find a logical excuse.

The peeling of paint in the winter, however, is, in the majority of cases, we feel justified in saying, due to elements of the weather over which the painter has little, if any, control. The carriage comes into the shop (speaking now of work that has to be coated from the bare metal up), and is subject for some days to the control of the painter. In the warmth of the room the metal parts expand, possibly ever so little, and during this expansion the painting and finishing are carried forward, and in due time the vehicle goes out into the bleak, cold world to eke out its days of service. But, alas! in the moment of seeming security the entire film of paint and varnish rolls away from the surface in a great, plastic sheet, which lays bare the shining metal foundation between which and the pigment no affinity exists. The system of painting may have been of the very best and without flaw—the result, under the prevailing weather and service conditions, would be the same. It is simply a repetition of the calamity which followed the loss of the horseshoe nail. The expansion of the metal in the warmth of the shop had in the biting frost outside produced an opposite effect, namely, contraction; and to such an extent had this contraction developed that the paint structure is just naturally unseated—slid off its base, as it were. In a certain shop where this peeling difficulty has been encountered repeatedly, despite the best laid plans of careful painters, the practice was some time ago adopted of using, during the winter month, a red lead and raw linseed oil primer upon all metal parts of vehicles to be put immediately into service, since which time no case of paint peeling from the above cause has been noted. Car painters have this difficulty to contend with to a large extent during the winter, and they resort to various expedients to overcome the trouble. The surface in some instances is primed with elastic finishing varnish, and in others with a patent transparent primer composed of resinous gums in connection with oils and other elastic materials, making an extraordinarily tenacious primer responsive alike to the law of expansion and contraction.

Some pigments, especially many of the dark, fine colors used in carriage painting, are naturally brittle, with a tendency to separate from the surface over which they are applied, and this disposition the intelligent carriage painter is ever industriously studying to counteract—to eliminate totally, in fact.

New Home of the Rainier.

The new building on the corner of Broadway and Fifty-sixth street, of which the Rainier Motor Car Co. became possessed on the first of the year, is a fitting addition to the elaborate structures that have been and are being erected on New York's "automobile row." With a frontage of 50 feet on Broadway and 136 on Fifty-sixth street, it is five stories high and with the basement, it is to be used exclusively for the Rainier cars, of which there are accommodations for at least one hundred and eighty.

As the illustration shows, the outward appearance is imposing, and inside one finds a thoroughness of detail in the appointments and equipment that proclaims the building adequate for the demands that are to be made upon its facilities. In addition to the executive offices and show rooms, the building houses the garage and repair and paint shops.

MAINTENANCE OF BODY SURFACE

Lack of Care a Chief Reason for Its Rapid Deterioration—Proper Method for Cleaning a Car.

The average American bent upon matters of research should encounter small difficulty in accounting for the lack of durability charged up to the automobile's structure of paint and varnish. It is not that the painter, so far as his craft practices are concerned, is blamable, but rather that, next to the actual user of the machine, the party charged with the care of it during its hours of inaction is responsible for the color that, unlike the beast of the jungle, changes its spots, or for the varnish that sheds its lustre prematurely.

The finished surface thrives or perishes according to the treatment tendered it, and without referring to the general hard service it is forced to undergo during its life on the highway, which in not a few respects is simply disastrous, it is in order to point out that plenty of the lack of durability complained of in respect to automobile surfaces should be charged directly, and without any misgivings, to the care taker or garage washer and cleaner.

A carriageman relates that not long since he witnessed the operations of one of these garage attendants, in his attempt to clean a touring car just in from a run about town. In the first place, he says, the chap ran the vehicle, a valuable one, into the blazing rays of the sun, and without an appreciable twinge of conscience, turned the hose, under high-water pressure, bang upon the surface. If there is anything fraught with greater injury to the varnish, and thus in a proportionate ratio, to the color and other coatings beneath the varnish, than this high pressure water bath through the deadly and convenient hose, it has not been catalogued, adds the carriage expert.

The automobile surface, on the whole, should be, and, we believe, really is, quite as capable of giving a good account of itself as the surface of the horse-hauled vehicle, but it has in most cases a greater exposure of surface, and a more destructive form of service forced upon it, so that in the natural order of things it is not capable of withstanding anything but the most considerate treatment in the course of washing and other care taking and cleaning operations. This much the painter owes it to himself to explain to the automobile owner or party in charge. The automobile should be washed, as a matter of fact, just as the horse-drawn vehicle is washed—with sponge and water gently applied—and lightly dried off with a lint free chamois skin; and it should be kept clean, and given other proper care, otherwise durability will be like the letter that was long looked for, but never came.

OWNERS FAVOR A NEW HIGHWAY

Massachusetts Automobilists Declare for the Pittsfield-Springfield State Road—Work of Owners' Association.

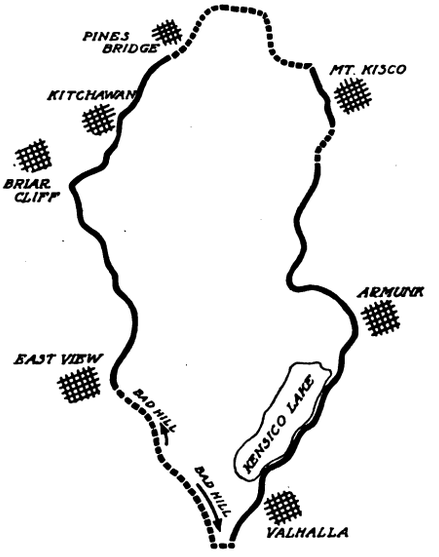
Voting in favor of the plan for building a State highway connecting Pittsfield and Springfield was one of the most important actions of the Automobile Owners' Association, at its annual meeting, held in Boston, on Wednesday, 15th inst. The association, according to the annual report of President Tudor, now has nearly 1,000 members.

Among the things it has done during the year was the purchase of a number of signs to mark dangerous crossings or curves in the highways, all of which have been distributed free to cities and towns requesting them. Considerable aid has been given the authorities in checking reckless driving. Among other things, President Tudor said:

"The association has protested a number of restricted speed and exclusion regulations which were adopted by cities and towns, in order to keep intact a uniform automobile law throughout the commonwealth, and has successfully maintained its protests in many instances.

"During the past year 1,026 convictions have been reported to the highway commissioners. The number of arrests is the greatest in the history of the State. Out of several hundred arrests of members during the past year with which counsel for the association has had to deal, more than two-thirds of the persons concerned in these complaints have been acquitted of the offenses charged, or their cases have been nol prossed or filed in the inferior or superior courts."

The following officers were elected: President, Frederic Tudor; treasurer, John M. Graham; secretary and counsel, Francis Hurtubis, Jr. In addition to the old board of directors the following were elected: George D. Clapp, Boston; A. B Cobb, Newton; Henry N. Richards, Boston; W. A. Underwood, Cohasset; C. M. Bryant, Quincy; H. B. Stowell, Brookline; Lewis R. Speare, Newton Centre; George Tyson, Boston.



Course for the Briarcliff Trophy Race.

C. F. Redden, manager of the Studebaker's automobile branch in New York, who last week drove over the route of the Briarcliff trophy race in Westchester county, New York, is of opinion that the course is a "sportier" one than the Vanderbilt circuit on Long Island.

"From East View," said Mr. Redden yesterday, I drove through Briarcliff to Kitchawan and Pines Bridge and found the roads in excellent condition for this time of year. From Pine Bridge to Mt. Kisco the roads were poor, but this seemed to be due largely to the season. During the Spring, and after the roads are settled these are good county roads.

"The roads are exceptionally fine from Mt. Kisco through Armunk and past the long Kensico Lake to Valhalla. The only drawback being a few bad turns. From Valhalla back to East View the course leads over a road, which although good as American country roads go, is actually hilly and will test not only the endurance of the cars but the ability of their drivers.

"It is a route that is well calculated to test the skill of the drivers no less than the running qualities and speed of the cars, but if the race is to be a positive success, it is

MAP OF THE BRIARCLIFF TROPHY COURSE

absolutely essential that the course be properly policed. There are a number of cross and intersecting roads which without an efficient policing system, will make fast driving almost impossible. After going over the course carefully, I believe that a car like the 40 horsepower Studebaker, which we will enter, will have an equal chance with some of the largest racing cars. For I believe that in a 300 mile race of this kind, absolute reliability rather than excessive speed will win the race. Of course the ability to get under headway quickly, after rounding a corner, is going to be an important factor, and the long wheel base car is laboring under great disadvantages."

While Mr. Redden terms the course "sporty," others who have been over it style it dangerous. It is treacherously narrow in places, and aside from many right angled turns, there are stretches of road which resemble the wrigglings of a serpent. At one point there are three "wriggles" in less than half a mile, with the choice of an embankment on one side, a lake on the other. The possibilities for "happenings" are immense.

"SQUEEZE 'EM AGAIN" SAYS FORT

New Jersey's New Governor Aecommends Higher License Fees—He also Urges a Motor Vehicle Department.

Automobiles and public roads received some attention from Governor F. Franklin Fort, of New Jersey, in his inaugural address at Trenton on Tuesday, 21st inst., as was expected they would. The establishment of a separate department for the licensing and regulation of automobiles, higher license fees, based according to horsepower; an increased number of officials to see that the laws are enforced, more rigid penalties for violations thereof, are some of the recommendations of the new governor. At present his State exacts $7 per year for large cars and $4 for small ones.

In speaking of the demand of the public for the enforcement of the automobile laws, Governor Fort said:

"A very large percentage of the automobile drivers are careful, but there are some who are not. If the present automobile law is too stringent it should be amended. A speed of twenty miles an hour in many places is not excessive; in fact, it may be said to be quite moderate, without misstating the truth; while in other places, a speed of twelve miles an hour is more rapid than these machines should be permitted to go. . . . . There should be sufficient officials in the department . . . . to see that it (the law) is enforced, and the penalty for the violation of the law should be more severe."

Governor Fort expressed himself as highly pleased with the policy of the present highway department, and suggested that more miles of "admirable highway" should be constructed,, and "maintained after they are built." He explained that when the roads were built by State aid they were constructed for light traffic, and that automobiles have injured them to great extent; for that reason he is in favor of a higher license fee, to cover the cost of repairs.

"If the license fee method is adopted," said the Governor, "then it should be graded on the basis of the horsepower of the machine operated. It would seem as if we should get from the automobile owners a revenue of about $250,000 per year, and this entire revenue should be devoted to the repair, or the aiding in the repair of the public highways of the State, the building of which has been assisted by State aid.

"This tax need not be a heavy one upon automobiles, and the drivers of these machines are quite as anxious for the preservation of the public highways by the keeping of them in repair as the rest of the traveling public, and they will not object to a reasonable license fee, fixed upon the basis of the horsepower of the machine operated"

Oil Sediment for Road Treatment.

At the Pope-Toledo factory in Toledo, they believe they have settled the dust nuisance and pointed the way to a phase of road improvement. The plant covers a large area. At the rear of the factory buildings is a circular speedway, while between the buildings are driveways. These roads are subjected to very severe use from testing cars constantly passing over them, going out and returning to the factory, generally at great speed; heavy traffic of large trucks, heavily loaded touring cars, etc. Naturally these drive and speedways created lots of dust and required constant repair. Much experimenting has been done, and the Pope-Toledo people say they have finally hit upon a road treatment which gives excellent results and is very economical. The Pope-Toledo factory has its own steel treating furnaces, some oil heated, and in it the sediment from the crude oil used in the heaters, sprinkled with an ordinary sprinkling can, over the surface of the roads, that has improved the neighborhood of the plant. Three treatments a season, it is said, makes the roadbeds waterproof, lays the dust, and prevents ruts, breaking of embankments, etc.

Direct Drive as a Saver of Power.

Generally speaking, the direct drive is held to be of great advantage as a means of saving power, as compared with the same speed developed on a lay shaft drive which is indirect. The latest performance of the industrious Edge-Napier testing plant, however, tends to show that the gain effected in this way is not so very great after all, although in common with all similar advertising exploits, it was intended to reveal the superiority of the system. A complete test of a 30 horsepower, 6-cylinder car, showed a maximum difference of only 1 horsepower between the power at the road wheels on the direct high and the indirect second speed, with the motor running at its most profitable rate. The difference in efficiency of the transmission system for the same motor speed revealed a variation of not more than 4 per cent. The absolute gain of the direct connection thus appears to be largely nominal in so far as the power question alone is concerned.

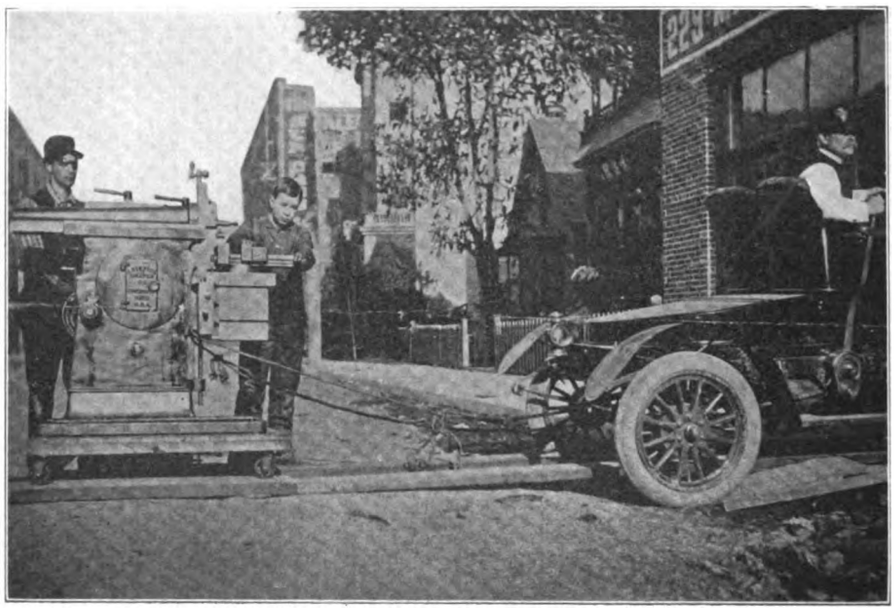
Manual Adjustments for Service Brakes.

Several of this year's foreign cars are provided with manual adjustments for the service brakes, the arrangement being such that the driver can readily alter the tension of the brakes in a moment or two without using any tools or disconnecting any of the linkage. The advantage of this is manifestly very great. For while theoretically the brakes should always be in perfect holding condition, the fact is that at times the abrasion of the working surfaces is very great, while at others it is necessary to have the brakes so adjusted that they may be gently applied, and at still others, so tensioned that they will lock the gear at once. On this account such an adjustment, providing handy means of altering the set up of the brakes at any time when they prove at all inefficient, is a most useful one.

Many Ways of Saying "Chauffeur."

"What's the 'chofer' doing all this time?" questioned Attorney Bell of a witness in the trial of an automobile damage suit in the Indianapolis courts last week.

"Well, to be frank, I don't remember," was the reply. "I was not paying much attention to the 'chaffewer.'"



Several other witnesses were called, including a policeman and a physician, and the same question was put to each of them. The witnesses did not all agree with the attorney in the pronunciation of the word. The patrolman in great pride called it "chaff-ore," the doctor pronounced ot "chofure," one young lady noticed the "cheefer," while still another thought it ought to be "shover." As yet the correct pronunciation of the word "chauffeur" has not been hit upon.

Women to be Club Members.

It generally is acceded that in the South the genus homo are more chivalrous toward the weaker sex than is apparent in the north. Although women will not be permitted to drive in the proposed stock car race in Westchester county, New York, they will be allowed to become active members of the Automobile Club of Maryland, the club having made this decision last week. Of course, the comparison is somewhat remote, and it is not known what the Marylanders would do if a feminine member of the club should want to compete in a race of its promotion. But, anyway, in Baltimore women don't go in for that sort of thing.

Strenuous Work for an Automobile.

That the emergency uses to which the useful automobile may be put is constantly increasing is not a matter of surprise. It was a saying of that almost forgotten celebrity, Sam Patch, that "some things can be done as well as others," and this applies in large measure to the automobile in its utilitarian character, which it exemplifies in an extended list of practical service, from the delivery of family groceries to the transportation of a grand piano. Its capabilities for arduous service that would seem to be near to the limit may be seen in the accompanying illustration which aptly might be called a moving picture. The vehicle is a Rambler runabout, Model 22, owned by D. C. Wilgus, a manufacturer in Los Angeles, Cal. When recently he transferred his business to a new location he moved the entire equipment of his machine shop with this utility car. Planers, lathes and general machinery to an amount representing a value of about $12,000 was successfully transported, and Mr. Wilgus credits to his profit and loss account a very considerable amount saved in the item of truckage expense.

RAMBLER ENGAGED IN HEAVY MOVING

Backing up Their Assertions.

If Triumph grease, the red lubricant, does not command more than usual attention, it will not be for lack of opportunity afforded by its makers, the Perfection Grease Co., South Bend, Ind., who literally "show their faith by their works." The grease is a new compound which is claimed always to retain its sponginess, which will not melt and run away, and is therefore cleanly and economical, and which is not affected by cold weather. The makers back their assertions by offering to refund any expense to which a user of the grease may be put if it fails to substantiate their claims.

ROAD REPAIRS IN NEW JERSEY

What They Cost Last Year and What Automobiles Contributed—The Commissioner Wants More.

When the New Jersey legislature enters upon the work of amending the automobile laws it is expected to derive considerable light from the annual report of State Road Commissioner Hutchinson and a paper on road repairs accompanying it.

In this paper the commissioner expresses a desire to see established in every county of the State a system similar to the one existing in France, and which recently was described in the Motor World. He would, he says, "apportion the roads in such a manner that a man with a team can take care of his section properly by spending his entire time on the roads for at least nine months in the year. In road repairs 'a stitch in time saves nine,' and wherever there is a depression on the road, caused by a rut or otherwise, it should be remedied at once. When the counties of the State adopt this system of road repair the road repair account will be considerably less than it is at present."

In his report the commissioner says: "We have 1,235 miles on roads built under the State aid law, toward which the State has contributed $2,283.097, an investment of which we are proud, and which is certainly well worth taking care of. In addition to this, the counties have built 800 miles without State aid, which they must also keep in repair.

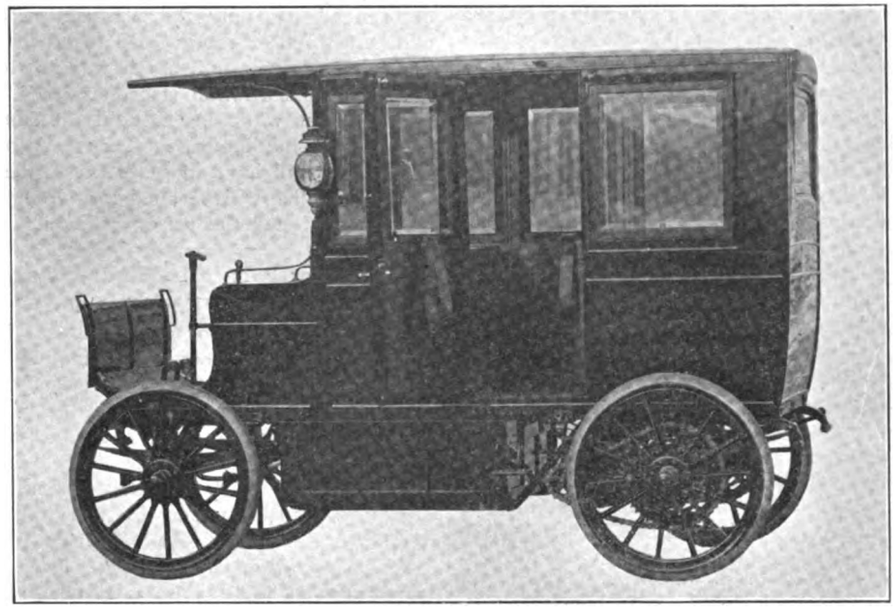
"Under the automobile law, passed two years ago, we will have about $82,000 to distribute in 1908 among the different counties as the State's contribution toward repairs. While this seems like a large sum, I feel that the license fee should be increased, because we will need for our more than two thousand miles of roads over $600,000 to keep them in repair, allowing an average expenditure of $300 for each mile of road. This is a low estimate of our repair account. My opinion is that the automobilists will have no objection to paying a larger part of the cost of repairs, provided the money is spent judiciously and the roads are kept in good order. My experience as an automobilist is that automobiles are of little practical use if we do not have good roads and I am personally proud, taking them as a whole, of New Jersey's improved roads, and it is my one desire that we shall keep those we already have in good repair."

The commissioner then goes into deails of every county, showing for the first time what repairs have cost the State and counties for the last year. He also tells the Governor that of new roads his department has accepted 83,332 miles, and has under contract 63.086 miles, that his department has examined and approved surveys for improving 99.93 miles of roads, making a total of 245,738 miles of roads, lying in all portions of the State.

According to the road repair section of the report, there was spent in New Jersey last year for road repair $648,488.60, of which sum the State gave from its automobile licenses and fines $56,473.85, leaving the counties to furnish $592,014.75 of the repair moneys.

Pawtuxet Protests Against Speed.

Pawtuxet is one of the suburbs of Providence, R. I., and it boasts of an Old Home and Improvement Society that manifests a disposition just now to take a whack at the automobile by means of the "big stick" of the State legislature. Its committee on resolutions reported at the meeting of the society last week a set of resolutions to be transmitted to the General Assembly stating that "the Pawtuxet Old Home and Improvement Association, in regular meeting assembled, does hereby express its disapproval of the high speeding of automobiles aforesaid, and respectfully requests of the General Assembly such legislation as will further assure to the inhabitants, not only of this locality, but to the citizens of the State in general, a relief from such jeopardy." It is stated that the resolutions may be adopted when the members are again "in regular meeting assembled."



More Massachusetts Licenses Revoked.

Two licenses were revoked last week by the Massachusetts Highway Commission, both for reckless driving. Edward W. Arnold of Abington, and George C. Gokey of Cambridge, are the drivers who must surrender their "papers," the latter being commanded to return his professional chauffeur's badge as well.

AUTOMOBILE TREASURE TRANSPORT

Specially Equipped for Bank Service in St. Louis—Its Strong Box and How It is Guarded.

Literally "loads of money" make up the daily cargo of a smart looking automobile that has recently been seen stopping in front of express offices and factories in St. Louis, besides making frequent trips to the sub-treasury. In appearance it resembles an elaborate limousine, as may be seen by the accompanying illustration, and its function is to carry cash and valuables to and from the National Bnk of Commerce.

BUILT TO TRANSPORT TREASURE

The vehicle is an electric built especially to the bank's order by the Studebaker Automobile Co., of South Bend, Ind. At times the car transports over 9,000 pounds of money during the course of a day. Factories that are customers of the bank and that wish to pay off in currency, have the money sent to their places of business by means of the machine, and establishments receiving great quantities of currency during the course of the day and wishing to deposit it, send for the wagon. Inside the body is a heavy steel strong box, having five compartments and fitted with forbidding locks. At the rear, and facing the box, is a broad seat for the person in charge and the officer or guard. The vehicle is built upon a regular Studebaker electric chassis of 1,500 pounds capacity, and with a 1,000 pound load in addition to the body, has a radius of forty miles at a speed of twelve miles an hour.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

Proposed "Pounds" for Automobiles.

Almost every city, town and village in America has its dog pound, where stray and homeless canines are impounded until claimed by owners or disposed of by the authorities, and now New York City shortly may have its "automobile pound" to meet the same requirements. Last year the street cleaning authorities displayed unwonted vigor in keeping the streets clean and their crusade reached such high proportions that they could not see the dirt close to the streets but automobiles towering above them. They gathered a number of cars that had been left standing in front of office buildings or residences while the owners of the cars were attending to business or making social calls. Naturally there was a great deal of unfavorable comment from the owners, but the department officials were firm, and insisted upon keeping the streets clear of obstructions of the sort.

General Superintendent William Robbins of the Street Cleaning Department of New York City is nothing if not polite, and knows how to encase his iron hand in a velvet glove. That he means to start another crusade against the practice of leaving unguarded automobiles in the street, is evidenced in the following letter sent out to the district superintendents:

"By direction of the commissioner, you will call on the managers of the garages in your respective districts and present his compliments, taking advantage of the occasion to inform them that this department is obliged by law to keep the streets of this city clean of all obstructions, and that they will greatly aid him in this duty by not permitting their automobiles to stand in the street in front of their places. Their doing so will be at their own risk, for the law compels their seizure by the officers of this department."

Automobile Truck for Hauling Fruit.

That the automobile will prove a blessing to growers and packers and will be the means of great saving in cost of transportation of the fruit is the belief of the Penn Fruit Company of Riverside, Cal., which has followed up its opinion by the purchase of a big truck to haul oranges from the groves to the packing houses. It is the first truck to be used in California for this purpose, and other growers will watch the experiment with interest. The new "orange truck" has a capacity of five tons and can haul 200 boxes of fruit, while a trailer can be attached to hold 100 boxes more. Hauling 300 boxes of fruit at one time will do away with four teams, while the decrease in maintenance and saving in time is expected to amount to considerable.

Western Cities Try Automobiles Patrols.

Indianapolis and Chicago have followed the lead of New York in experimenting with automobile patrol wagons. The Indianapolis "Black Maria" went into commission last week, while the Windy City's "drunk wagon" as it is called, will be given its initial tryout this week. There was keen competition in providing the patrol wagon in Indianapolis as there are two factories right "in its midst," and each wanted the honor of placing the machine. It finally was awarded to the company that bid $1,500 and it is said that it cost more than $2,500 to build the car.

Wily Turk's Scheme Went Wrong.

Turkish methods of applied substitution did not meet favor with Parisian police in the case of Vahinakin Ladar, a Turkish merchant of Paris, who was sentenced to two days' imprisonment for exceeding the regulation automobile speed laws. Ladar determined to apply the Turkish method and paid a fellow countryman to go to prison instead of himself, but it was not long before the substitution was discovered. On Monday last when he thought all danger had passed the ingenious Turk was rearrested and will have to serve the sentence. His accomplice will be tried for forgery as he falsely signed the prison register.

Governor Fort to be Club's Guest.

Governor John Franklin Fort will be the guest of honor at the annual banquet of the New Jersey Automobile and Motor Club, to be held in Newark, Thursday night, February 6th. The entertainment committee received the Governor's acceptance late last week. William H. Hotchkiss and F. H. Elliott, president and secretary, respectively, of the American Automobile Association, and Charles Thaddeus Terry, chairman of the legislative committee of the National Association of Automobile Manufacturers', also have promised to eat, drink and be merry with the Jersey motorists.

Quaker City Club's Nominations.

Nominations for officers to be elected at the annual meeting on February 6th, have been made by the Quaker City Motor Club, of Philadelphia, as follows: For President, P. D. Folwell; first vice-president, A. T. James; second vice-president, L. D. Berger, treasurer, A. T. Stewart; secretary, H. C. Harbash and I. C. Minford; board of governors, R. D. Bartlett, C. J. Swain, E. C. Johnson, G. Hilton Gantert, E. C. Lewis, E. H. Fitch, F. E. Church,, Dr. J. H. Overpeck, A. E. Maltby, E. C. Leeds, Frank Hardart, M. E. Brigham, F. C. Vanderhoof, E. F. Paist, L. E. French, N. Petry, Daniel Webster and George N. Graham.

Schultz Heads Staten Islanders.

Charles A. Schultz was elected president of the Richmond County Automobile Club, of St. George, N. Y., at the annual meeting last week. Other officers chosen were: Vice-president, O. W. Sprigg; secretary, J. J. Worrell; trustee for three years, Dr. J. W. Musgrove.

Chauffeur's Definition of a "Gump."

A "gump" is a man "who has an ever abiding weakness for posing as the owner of his employer's car after the shades of night have fallen and the said employer is enjoying more or less peaceful slumber."

This, at least, is the definition given by President Johns at the stag party of the recently organized Illinois Chauffeurs' Association, at Chicago last Thursday night, 16th inst. More than 100 chauffeurs and several invited dealers were present and President Johns defined the "gump," while taking a fling at the chauffeur who posed as the owner of his employer's car.

The association, the president explained, is not a labor union and will not have anything to do with the differences that arise between employer and employee, except to discipline any member found guilty of "'railroading,' drunkenness, or dishonesty." Several local dealers who were present addressed the chauffeurs and wished the organization a successful and uplifting career.

Colored Porter's Joyless Joy Ride.

A man once hired a negro to clear off a small piece of stubble land for him, the remuneration agreed upon being one dollar per day. The next day, the employer, chancing to go past the place, saw two negroes in the field, one laboriously sweating at the end of a grubbing pick, while the other sat upon the fence and swore vociferously at the other.

"How's this," said the employer, addressing the negro upon the fence, "didn't I hire you to do this work? Who is this other fellow"?

"Well, you see, boss, it's lak dis: I hired him to do de work at a dollar a day."

"But that's all I said I'd give you. How do you make anything"?

"Well, boss, dat's a fac', but I has the fun o' bossin' him."

All this anecdotal prelude has nothing to do with the case in point, but it explains the desire in "darkies" to appear "big" before their friends, and why the Rainier branch at Chicago is without a demonstrating car. Manager A. M. Robbins didn't know that the colored porter he recently engaged had any ability as a driver and so had not given George carte blanche use of the cars in the garage. It may have been this fact that prompted George to give his colored friends an exhibition of his skill while Manager Robbins was asleep. A telegraph pole inconveniently stood in the way and it will cost $1,500 to repair the car. George has not been seen since the accident, so the police are looking for him.

Santa Barbara Club Elects Duncan.

At its annual meeting the Automobile Club of Santa Barbara, Cal., elected Titus Duncan president; W. L. Newton, vice-president; G. W. Bates, secretary, and John Marshall, treasurer.

The Week's Patents.

868,737. Spark Plug. Frank J. Watt, Detroit, Mich., assignor of one-half to Roy E. Hardy, New York, N. Y. Filed March 28, 1904. Serial No. 200,323.

1. In a spark plug, the combination of an externally screw threaded bushing provided with a central bore reduced in diameter near its upper end to form a shoulder, an insulating plug of a diameter to pass partially through the reduced portion of the bore and formed with a shoulder intermediate its ends to oppose the shoulder on the bushing and with an axial bore of uniform diameter throughout its length, a packing ring interposed between the shoulders on the plug and bushing, a binding bolt forming an electrode extending axially throughout the bore of the plug, a head on the inner end of said bolt to engage the inner end of the plug, a sparking point secured to said head and extending laterally therefrom toward and within the inner face of the wall of the bushing, a nut on the bolt engaging the opposite end of the plug, an insulating cap having an opening for the passage of the bolt inclosing the outer end of the plug and seated upon the end of the bushing, a packing ring interposed between the cap and bushing, a washer bent to form a spring sleeved on the bolt in engagement with the cap, and a nut and binding nut to engage said washer and clamp the parts together.

868,786. Driving Appliance for Speed Meters. Ragnor Johnson, Worcester, Mass. Filed Nov. 9, 1906. Serial No. 342,751.

1. In a driving appliance for speed meters, the combination with the toothed crown wheel, of an outer flange applied in connection therewith, an encircling band, an inner flange applied in connection with the crown wheel and perforated, screws passing through said inner flange and into the spokes of the vehicle wheel, and bearing blocks through which the screws pass, said blocks being interposed between the flange of the crown wheel and the spokes, substantially as shown.

868,797. Transmission Mechanism. Geo. D. Munsing, New York, N. Y. Filed April 23, 1907. Serial No. 369,787.

1. The combination with two shafts and a gear wheel on each of them, of planet gearing between the gear wheels, a clutch member movable in unison with the planet gearing, a co-operating clutch member and means to frictionally lock the parts of the mechanism against relative rotation.

868,806. Electric Motor. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Filed Nov. 25, 1905. Serial No. 289,140.

1. In a controlling device for an electric motor, the combination with an armature shaft and contact plates mounted thereon, of a movable contact member normally connecting said plates, a tension device attached to said member and movable in a direction transversely of the armature shaft, and a member movable longitudinally of the shaft and co-operating with the tension device, means for operating it and a motor circuit leading to the contact plates.

868,834. Explosive Engine. William K. Bassford, Perth Amboy, N. J., assignor to Vapor Gas Engine Manufacturing Company, Perth Amboy, N. J., a Corporation of New Jersey. Filed Jan. 22, 1906. Serial No. 297,339.

1. In a gas engine, the combination with a cylinder, a supply and exhaust, of means for heating the supply by the exhaust, and automatic means controlled by the temperature of the supply adjacent the point of its admission to the engine for governing the heat of the supply.

868,839. Hydrocarbon Engine. Jan Brons and Nanno Timmer, near Delfzyl, Netherlands. Filed July 1, 1904. Serial No. 214,927.

1. In a four stroke cycle hydrocarbon engine, the combination with a spring-pressed inlet valve for liquid combustible, of a shallow box beneath and surrounding said spring pressed inlet valve within the cylinder and provided along its periphery with a plurality of holes at a small height above its bottom, it being adapted to contain up to its holes the quantity of liquid combustible required for a cycle.

868,851. Machine for Propelling Plows or Other Agricultural Implements. Emil Erixon, New York, N. Y. Filed Nov. 19, 1906. Serial No. 344,168.

1. A machine of the character described comprising a frame, a motor, a chain operated by said motor and provided with rollers arranged to bear upon said frame, and a plurality of foot pieces carried by said chain, said foot pieces being connected to said chain in such manner as to permit independent movement of said pieces relative to the chain.

868,907. Automobile Locking Mechanism. John F. Coltman, Chicago, Ill. Filed Sept. 22, 1906. Serial No. 335,709.

1. The combination, with a lever, a lever guide, a lock casing secured to the guide so as to have its face flush with the side of the guide, a spring actuated bolt mounted in said casing and arranged to move transversely of the plane of movement of the lever, said lever having an opening therethrough to receive the bolt and a plate arranged opposite the lock and at a distance therefrom equal to the thickness of the lever.

868,935. Speed Changing Mechanism. George D. Munsing, New York, N. Y. Filed May 23, 1907. Serial No. 375,324.

1. In a speed changing mechanism, the combination with driving and driven shafts; of gearing between the two shafts, a cylinder, and a rotary piston therein to control the rotation of the gearing.

868,939. Pneumatic Pump. Hadley C. Reames, Los Angeles, Cal., assignor of one-half to George H. Reames, Los Angeles, Cal. Filed Sept. 20, 1906. Serial No. 335,340.

1. A pneumatic pumping mechanism for a vehicle tire, comprising a cylinder rigidly secured to the rim of the vehicle wheel; an air inlet valve operatively mounted in the outer end of said cylinder and in communication with the tire on said wheel; a piston in said cylinder provided with a piston rod; means attached to the frame of said vehicle adapted to reciprocate said piston rod upon the rotation of the vehicle wheel; an auxiliary cylinder secured to said first named cylinder having an open port in communication with the tire on said wheel; a spring pressed piston in said auxiliary cylinder adapted to be moved inwardly against the spring pressure by the air pressure in said tire; and a spring catch mounted in said auxiliary cylinder adapted to be pressed into the first named cylinder by the inward movement of the piston in said auxiliary cylinder.

869,021. Internal Combustion Engine. Odin Roberts, Dedham, Mass. Filed Sept. 9, 1905. Serial No. 277,676.

1. In an internal combustion engine, an assemblage of opposed cylinders with balanced parts, means to eliminate from operation successive balanced portions of the assemblage cumulatively leaving the active residue in balance, and means to vary the operation of said alternating devices to change the location of the active residue in the assemblage.

869,025. Metal Vehicle Body. Hinsdale Smith and Arthur P. Smith, Springfield, Mass. Filed April 2, 1907. Serial No. 365,902.

1. In a vehicle body, the seat portion of the same having a bead formed therein, a bow-piece secured to the body portion and at the rear side of the seat portion of the body; said bow-piece being of different material than the body portion whereby the unholstering material can be readily attached thereto.

869,058. Speed Changing Device. John G. Callan, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed June 6, 1904. Serial No. 211,243.

1. In combination, a shaft, a support, a member secured to said support and angularly adjustable with respect thereto about said shaft as a center, a rotating member carried by the first mentioned member and eccentrically mounted with respect to said shaft, and a speed changing driving connection between said shaft and said member.

869,061. Supporting Frame for Canopies, Awnings, etc. Roy A. Cox, Elwood, Neb. Filed May 13, 1907. Serial No. 373,453.

1. A supporting frame for awnings, canopies and covers comprising a pair of L-shaped members, a pair of angle members adjustably connected to said L-shaped members, a U-shaped member adjustably connected to the angle-shaped members, and supporting arms secured to said angle-shaped members and said U-shaped member.

869,109. Motor. James Thomson and Ernest Schwamberger, Pittsburg, Pa. Filed Feb. 16, 1905. Serial No. 245,974.

A device of the class described, comprising a cylindrical casing internally threaded at one end and reduced at the other end with a bearing in the reduced portion and with discharge ports at the juncture of the reduced portion and the body of the casing, an externally threaded annular member engaging the threaded portion of the casing, and with a plurality of angular recesses in its periphery and transversely of its threads, said annular member having a projecting annular sleeve internally threaded, a collar having means at one end for connecting to the source of power and with a threaded portion at the other end engaging the threaded portion of said casing exteriorly of said annular member and with a central shaft step externally threaded and engaging the threaded sleeve of the annular member, a shaft mounted for rotation through the bearing at the reduced end of said casing and supported in said step at the other end, and a water wheel having spaced peripheral blades and connected to said shaft adjacent to said annular member.

869,143. Transmission Gearing. Ross M. G. Phillips, Los Angeles, Cal. Filed Dec. 28, 1905. Serial No. 293,605.

1. A driven element, a plurality of oscillatory power transmitters for driving said element, a power shaft, a plurality of ec-

Digitized by Google

centrics on the power shaft, means operated by the eccentrics for driving said oscillatory power transmitters, and means comprising a rack having inclined teeth slidable on the power shaft for shifting said eccentrics radially of the power shaft while the power shaft is rotating.

869,171. Valve. Claud H. Foster, Cleveland, Ohio. Filed Oct. 1, 1906. Serial No. 336,956.

1. The combination, with the exhaust pipe of an explosive engine, of a valve casing or tee in said pipe, and a rotary valve body in said tee or casing having an inlet port and an outlet port, the wall of said valve body being provided with cutting edges adjacent said ports, and a removable stop for limiting the rotation of said body, substantially as specified.

869,172. Means for Heating Automobiles and the like. Claud H. Foster, Cleveland, Ohio. Filed Dec. 26, 1906. Serial No. 349,-398.

1. The combination of an engine, an exhaust pipe therefor, a muffler, a heater, an inlet pipe or connection extending between said heater and said exhaust pipe, an outlet pipe or connection establishing communication between said heater and the muffler, and a valve at the junction of the inlet pipe or connection and the exhaust pipe, said valve having an outlet port adapted to register either partly or wholly with said inlet pipe and the portion of the exhaust pipe leading to the muffler and having an elongated inlet port adapted to register continually with the portion of the pipe extending toward the engine while the outlet port is in communication with either or both of its pipes, substantially as specified.

869,193. Flexible Wheel for Motor and Other Vehicles. Henry F. Nichols, Adelaide, South Australia, Australia. Filed April 20, 1906. Serial No. 312,803.

1. In a flexible wheel for motor and other vehicles, an outer flexible rim or tire comprising a number of blocks or sections and an encircling band of flexible material such as rubber, an inner rigid rim connected to the hub by spokes, a series of plate springs corresponding in number to the sections of the outer rim and set tangentially to the rim, one end of each spring being secured to the inner rim and the other end free, the central portion being secured to the middle of a section, and detachable flanges or check plates secured to the inner rim and overlapping a portion of the outer flexible rim, all substantially as described and for the purpose set forth.

869,198. Nut Lock. Jesse F. Sandbock, Jacob W. Noble, and Lee O'Dell, Tylersburg, Pa.; said Noble assignor to said Sandrock and said O'Dell. Filed Feb. 18, 1907. Serial No. 357,875.

1. In a nut-lock, a bolt, superposed nut sections thereon, the contiguous surfaces of said sections having recesses, and one of said recesses communicating with the bolt hole of the respective section, and the other recess having a cam-shaped wall, and a dog pivotally mounted in the first mentioned recess, and engageable by its cam-shaped wall for moving the dog into and out of engagement with the bolt.

869, 208. Electric Ignition of Explosives. Oliver J. Lodge and Alexander M. Lodge, Birmingham, England. Filed April 10, 1903. Serial No. 152,028.

1. In a system of spark ignition, apparatus for firing a combustible mixture, comprising in combination, a low tension circuit, a source of current in said circuit, an interrupter in said circuit, a high tension circuit inductively arranged with relation to said low tension circuit, a spark gap in said high tension circuit, condensing means placed in said high tension circuit and adapted to discharge across said spark gap, a sparking plug forming a secondary spark gap disposed within the combustible mixture, means connecting said spark gas to the condensing means, and a connection normally keeping said sparking plug at the same potential, as and for the purposes described.

869,217. Roller Bearing. Franklin Stratton, Providence, R. I. Filed Dec. 10, 1906. Serial No. 347,173.

1. A roller bearing comprising an annular series of rollers having gudgeons at opposite ends, connected supports at opposite ends of said rollers having sockets to receive the ends of said rollers and apertures to receive said gudgeons.

869,260. Vehicle Body. Henry H. Porter, Jr., Chicago, Ill. Filed Feb. 14, 1905. Serial No. 245,561.

1. A vehicle body having a front seat, a compartment located behind said seat and an adjustable partition dividing the compartment into two sections, and provided with seats upon its oppositely disposed faces, substantially as described.

869,494. Change Speed Gear. Charles B. King, Detroit, Mich. Filed Sept. 12, 1904. Serial No. 224,057. Renewed March 30, 1907. Serial No. 365,601.

1. A part adapted to have a linear and an angular movement, in combination with other parts constituting together a speed change gear, said movable part being arranged to connect the parts of the mechanism for the different speeds in one direction by a linear movement, and for a speed in the other direction by its angular movement.

869,577. Radiator. Victor Lacing, St. Louis, Mo. Filed Feb. 19, 1907. Serial No. 358,303.

1. A device of the class described comprising a plurality of coils formed of bent sheets, the bends acting as strengthening ribs, walls supporting the ends of said coils, a casing located on each end and secured to the walls, said casings provided with passages for directing the circulation of the water, and stiffening frames connected to the edges of the coils and supported by the walls, substantially as specified.

869,583. Spring Suspension for Vehicles. Walter W. Macfarren, Pittsburg, Pa., assignor to William H. Donner, Pittsburg, Pa. Filed May 28, 1906. Serial No. 319,-126.

1. In a vehicle, the combination of a body or frame, main springs supporting same, and supplemental balancing springs adapted to carry a portion of the load.

869,601. Ignition System for Explosion Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed April 5, 1907. Serial No. 366,462.

1. In an ignition system for explosion engines, a single circuit controller permanently connected to the primary circuits of a plurality of induction coils, a dynamo circuit including a kick-off, a battery circuit including segments, and a switch for completing either of said last named circuits through said circuit controller and its permanently connected coils.

869,675. Gasolene Carburetter. Alexander Winton, Cleveland, Ohio. Filed Nov. 10, 1904. Serial No. 232,167.

1. An improved carburetter, comprising a mixing chamber, gasolene and air inlet passages in communication therewith, the air inlet passage having an annular member therein constructed to form a main air passage way therearound, auxiliary passageways in communication with the interior of the annular member, and a member normally obstructing the passing of air through the auxiliary passage and adapted to be moved away from said passages under the influence of the engine, for the purpose described.

869,713. Clutch Mechanism. Peter Jenness, Philadelphia, Pa. Filed Sept. 12, 1905. Serial No. 278,075.

1. In a friction clutch, a driving member, a driven member normally held in engagement therewith, endwise compressible yielding means for holding said members in engagement, and a single endwise compressible yielding means coaxial with the shafts of said members for moderating the initial engagement thereof, said yielding means being continuously opposed to each other and both acting to set the clutch.

869,865. Spark Plug. Alfred Holsten, New York, N. Y. Filed Dec, 2, 1904. Serial No. 235,143.

1. A spark plug comprising a socket member, a contact electrode thereon, an insulated member arranged within said plug and adapted for reciprocation therein, oppositely closing valves arranged upon said insulated member, and a contact electrode carried by said insulated member, substantially as specified.

869,881. Motor Vehicle Running Gear. David M. Dearing, Jackson, Mich. Filed July 23, 1906. Serial No. 327,421.

1. A vehicle running gear frame comprising forwardly converging, flanged end beams, longitudinally and transversely extending intermediate bars, said beams being connected together and to said bars by angle plates secured to the inner faces of their webs between their upper and lower flanges, and cushioning devices for suspending said frame from front and rear axles.

869,882. Variable Speed Power Transmission Device. David M. Dearing, Jackson, Mich., assignor of one-half to Louis F. Boos, Jackson, Mich. Filed Feb. 19, 1906. Serial No. 301,891. Renewed April 1, 1907. Serial No. 365,857.

1. In a device of the character described, a driving member having a bevel toothed working surface and a flat peripheral working surface, a driven member having opposing flat working surfaces to coact with the peripheral surface on said driving member and a bevel toother working surface adjacent to the center of one of said flat surfaces to coact with the toothed surface upon said driving member, and means for varying the relative positions of said members for the purpose set forth.

869,887. Internal Combustion Engine. James F. Duryea, Springfield, Mass. Filed Jan. 19, 1907. Serial No. 353,118.

1. In an internal combustion engine of the class described, a base portion, a camshaft and commutator shaft mounted therein and having means for driving one from the other, a yoke-shaped piece carried by the engine casing, a pump casing removably secured thereto, a pump located therein, the shaft thereof having a clutch connection with the commutator shaft whereby when the pump casing is removed the pump shaft

Digitized by Google

is disengaged from the commutator shaft.

869,968. Spring Suspension for Automobiles. Edwin J. Jenness, Chicago, Ill. Filed Jan. 18, 1906. Serial No. 296,701.

1. A spring suspension for vehicles comprising, in combination, a supporting spring connected at one end to the body of the vehicle and at an intermediate point connected to the running gear, a lever pivoted at an intermediate point to the body of the vehicle and at one end connected with the opposite end of said supporting spring, a second spring secured to the vehicle, and means carried by the other end of said lever and projecting vertically upwards to engage said second spring, whereby the downward movement of said other end of the lever is opposed by the action of said second spring.

869,994. Steering Mechanism for Automobiles. Ralph P. Thompson and Emil Koeb, Springfield, Ohio. Filed Oct. 16, 1905. Serial No. 282,892.

1. In an automobile, the combination, with a main frame and an axle provided with pivoted steering ground wheels and spring connected to the main frame so as to be movable relatively thereto, of a supporting plate rigidly secured to said axle, a worm gear segment pivoted to said supporting plate and operatively connected with the steering ground wheels, a worm carried by said supporting plate and meshing with said worm gear segment, and a controlling device supported on the main frame and operatively connected with said worm, substantially as described.

870,013. Vehicle Tire. Alton W. Butler, Brockton, Mass. Filed Dec. 8, 1906. Serial No. 346,839.

1. A wheel having an annular flanged bracket secured to each side of the rim, a flange on each of said brackets extending laterally away from the side of the rim, a series of coil springs seated on said flanges and secured thereon, each coil spring having an arm which extends transversely of the face of the rim at some distance radially outward from the rim and a tread portion seated upon and secured to said spring arms.

870,052. Carburetter. George M. Schebler, Indianapolis, Ind. Filed Sept. 21, 1906. Serial No. 335,621.

1. In a carburetter, the combination, with a fuel container having a discharge outlet, of a fuel valve, and air passage communicating with said outlet, a throttle valve for controlling the flow through said passage, and intermediate connections between said throttle valve and fuel valve whereby operation of the throttle valve will automatically shift the fuel valve, and means for so adjusting the connections between the throttle valve and fuel valve that the effect of movement of the throttle, valve on the fuel valve may be independently varied at different points of adjustment of the throttle valve.

870,065. Gas Engine. Allie R. Welch and Fred S. Welch, Pontiac. Mich. Filed May 29, 1905. Serial No. 262,780.

In a gas engine, the combination of a cylinder having an interior wall at its head end in the approximate shape of a portion of the surface of a sphere, an inlet and an exhaust valve forming parts of said wall when closed, each of said valves being provided with a stem extending at right angles thereto, one of said valves being located upon one side of said axis and the other upon the other side thereof, a shaft adapted to be actuated by the engine, said shaft being located upon the head of said cylinder adjacent, and approximately at right angles, to the axis of said cylinder, a single cam upon said shaft, and levers pivoted upon said cylinder and adapted to contact the valve stems and to be contacted by said cam to secure the proper timing and operation of said valves.

870,107. Transmission Gear. Emil Koeb, Leipsic, Ohio, assignor of one-half to Ralph P. Thompson, Springfield, Ohio. Filed Sept. 10, 1906. Serial No. 333,879.

1. In a device of the character described, the combination, with a driven shaft and high and low speed gears carried thereby, of a driving shaft extending parallel to said driven shaft, a gear rotatably mounted on said driving shaft and having inner and outer teeth, the outer teeth of said rotatable gear being permanently in mesh with said high speed gear, a pinion slidably mounted on said driving shaft and rotating therewith and adapted to engage either the inner teeth of said rotatable gear or to engage said low speed gear, and means for shifting said pinion, substantially as described.

870,171. Spring Cushioned Automobile Wheel. Walter A. Hill, Callicoon, N. Y., assignor of one-half to Valentine Scheidell and Guernsey Meyers, Callicoon, N. Y. Filed Jan. 2, 1907. Serial No. 350,392.

1. The combination of a wheel, of a body section, the rim portion of which is provided with a plurality of openings, independent compression springs arranged within the openings, said springs being arranged in an annular series, blocks at the end of the springs, said blocks projecting beyond the sides of the body section, and a tire section having openings, the end walls of which form wedges for engagement with the projecting blocks to thereby compress the springs in successive order during the rotation of the wheel.

870,183. Transmission Gearing. Elihu B Kent, Lansing, Mich. Filed Oct. 25, 1906. Serial No. 340,597.

1. In a transmission gear, the combination with a pair of engines including shafts and wheels, of a friction disc interposed between said shafts, means for connecting one or both of said shafts to the friction disc, two counter shafts, a friction gear on each counter shaft located each side the friction disc, an eccentric bearing for each counter shaft, means for simultaneously turning the eccentric bearings to cause the friction gears to engage opposite sides of the friction disc or to engage the two fly wheels, tnarsmission friction gears on the counter shaft, and a pinion on one of said counter shafts.

870,189. Brake for Power Driven Vehicles. Joseph N. Mahoney, Brooklyn, N. Y., assignor to himself, and James D. Leys and Samuel Jacobson, New York, N. Y. Filed Oct. 30, 1905. Serial No. 284,986.

1. In vehicle brake mechanism, the combination of a brake spring under tension tending to apply the brakes, a motor acting to impose further tension upon the spring to partially or wholly hold the brakes out of operation, retaining devices automatically acting while the motor is energized and after its circuit is opened to retain any such further tension of the spring, means for automatically opening the circuit of the motor when the brakes have been drawn to release position, a brake staff and operative mechanical connections between the staff and the retaining devices whereby the latter may be operated to abruptly or gradually release the increased tension of the spring to effect abrupt or variable application of the brakes.

870,228. Emergency Brake for Automobiles. Herman F. Dietz, Liverpool, N. Y., assignor of one-half to Anthony Will, Syracuse, N. Y. Filed May 16, 1906. Serial No. 317,051.

1. A vehicle brake, a support, a flexible connection carried by said support, and clamping means carried by the flexible connection adapted to engage the wheel of the vehicle and draw said flexible connection thereunder.

870,248. Pneumatic Tire. Harry A. Palmer, Akron, Ohio. Filed April 5, 1906. Serial No. 310,084.

1. The combination in a wheel rim for pneumatic tires, of a metal tire having one edge thereof cut away, pointed studs in the cut-away edge of the tire, and a flange adapted to clamp the inner edge of the tire sheath against the cut-away edge of the tire and the pointed studs therein, substantially as set forth.

970,258. Driving Mechanism for Automobiles. Edward O. Sutton, Springfield, Mass. Filed Feb. 15, 1907. Serial No. 357,537.

1. A friction driving mechanism comprising a driving disc and means to rotate the same, a second disc in axial alignment therewith, said discs being located on opposite sides of an axle or shaft whose axis is at right angles to that of the discs; friction discs rotatably supported on the axle on opposite sides of the axis of the driving disc, and clutches on the axle arranged to engage either of the driven discs at will, said clutches having a sliding movement on the axle and being rotatable therewith, together with means to move the driven discs radially of the driving discs, the clutches and the driven discs being capable of movement in opposite directions as a unit.

870,263. Clutch. William R. Warren, New York, N. Y. Filed March 7, 1906. Serial No. 304,724.

A clutch comprising the combination with a driving and a driven element, of a clutch member secured to one of said elements and provided with a pair of inclined seats having their walls at different degrees of flare or inclination, a clutch member slidably mounted upon the other of said elements and comprising two sections with differently inclined surfaces.

870,278. Cooling System for Automobile Engines. Jay N. Emley, New York, N. Y. Filed Feb. 17, 1906. Serial No. 301,528.

1. The combination of a vehicle frame having an engine compartment containing a water cooled engine, a radiator carried by said frame and outside said compartment, an air conduit leading from said radiator rearwardly of the vehicle, and means actuated by the engine for producing a draft of air through said radiator and conduit, said compartment having an opening whereby to permit air to be exhausted therefrom into said conduit, substantially as described.

870,287. Vehicle Construction. Charles J. Harris, Bridgeport, Conn. Filed Nov. 5, 1906. Serial No. 341,966.

1. An automobile having a body of the tonneau type and provided with a collapsible seat construction, the same comprising a seat bottom having a hinged back and a centrally hinged supporting rod, an underlying bracket adjacent the seat bottom and through which said rod passes, said bracket having diverging arms, one provided with a straight end and the other with a curved end, a socket at the floor of the body for receiving the lower portion of the supporting rod, a socket plate secured to a side member of the vehicle body, said socket

Digitized by Google

plate comprising a curved socket and a straight ended arms of the bracket restraight socket in which the curved and spectively are removably secured and a spring pressed latching pin for retaining the straight ended arm in its socket.

870,369. Sparking Plug for Internal-Combustion Engines. Arthur E. Lamkin, Croydon, England. Filed Dec. 4, 1905. Serial No. 290,235.

In an electrical device of the class described, a sparking plug comprising a conductor insulated from said plug, said plug having a passageway terminating at one end in a chamber, a nut secured in said chamber and having an opening therethrough, a non-return valve arranged within the opening in the nut, said nut further provided with holes for admitting air from the atmosphere within the said chamber, protective means covering said holes to exclude dust, and a tube forming a conductor mounted in the other end of the passageway and bent on itself to bring the bore of the tube in direct alignment with the first mentioned conductor.

870,549. Motor Vehicle. George P. Parks, Bedford, Ind., assignor, by direct and mesne assignments, to Postal Auto and Engine Company, Bedford, Ind. Filed Nov. 10, 1906. Serial No. 342,839.

1. In a motor vehicle, the combination of reach springs, an axle pivotally connected with the springs, means for and a condensing compartment, and means in the condensing compartment for directing the water of condensation along the partition for boiling the water to liberate the suspended gases therein.

870,502. Crank Shaft. Thomas J. Fay, New York, N. Y., and John M. Ellsowrth, Bernardsville, N. J. Filed April 8, 1907. Serial No. 367,025.

1. A crank shaft made up of a plurality of sections having surfaces facing each other, said surfaces being provided with oppositely disposed recesses and dowel buttons seated within said recesses but out of engagement with the bottoms thereof.

870,517. Automobile Rack. John A. Mason, Newton, Mass. Filed April 1, 1907. Serial No. 265,725.

1. A folding rack for automobiles and the like, comprising a skeleton frame of rigid material pivoted at its lower corners to projecting supports rigidly secured to the vehicle, the device having also depending supports connecting it to the seat-base, for the purpose set forth.

870,548. Tire Shoe. George Dentzeau, West New York, N. J. Filed Nov. 4, 1905. Serial No. 285,846.

1. In a vehicle wheel, the shoe, consisting of two halves, having serrated outer surfaces, and spoke sockets, means of holding the shells together at the bottom consisting of bolts and nuts, and means of hoidlng the outer edges.

870,602. Spring Wheel. Daniel Warner, Bronson, and Horace Kitchel, Coldwater, Mich., assignors to The American Auto Wheel Company, Coldwater, Mich., a Corporation. Filed Nov. 12, 1906. Serial No. 343,172.

1. In a spring wheel, the combination with a hub, of the inner spoke sections secured therein; a rim on the outer ends of said inner spoke sections; side plates secured to said rim, said side plates being provided with inwardly projecting annular flanges adapted to receive said rim; spring pockets on said side plates; screw caps for said pockets; spiral springs arranged in said pockets and retained therein by said pocket caps, the outer coils of the springs being adapted to fit the walls of the pockets; a felly; T-shaped outer spoke cestions, secured to said felly, the arms of said spokes being arranged in the inner coils of said springs; and guards of flexible material secured to said side plates and rim.

870,656. Detachable Tread for Pneumatic Tires. Charles B. Woodworth, Newton, Mass. Filed Dec. 12, 1906. Serial No. 347,438.

1. In a detachable tread for pneumatic tires, the tread portion; a wire substantially concentric therewith and adapted to extend entirely around the wheel, said wire being rendered expansible and contractible in the general direction of its length by its shape; and hooks connected with the tread portion and extending inward radially into engagement with the said wire, for the purpose set forth.

870,657. Traction Attachment for Vehicle Tires. Charles B. Woodworth, Newton, Mass. Filed April 9, 1907. Serial No. 367,272.

1. In a detachable traction attachment for vehicle tires, a series of sections adapted to extend across the periphery or tread portion of the tire and each consisting of a folded flexible strap with its ends secured together whereby loops are formed at the ends of the section on opposite sides of the tire, rings secured in said loops, and detachable links intermediate of and connecting said rings, for the purpose set forth.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

The Real Difference {IS IN THE PRICE

Stoddard-Dayton

MODEL 8-F TOURING CAR

Compares Favorably with any Car on the Market in

Quality Performance Reputation

REGARDLESS OF PRICE

In the parallel columns below we have made a comparison between an average of seven of the leading American built cars, ranging in price from $4,200 to $5,000 and the *Stoddard-Dayton Model 8-F.*

	Average of 7 Leading Cars	STODDARD-DAYTON
Power of Engine	45-50	40-45
Wheel Base	121-6	113
Seating Capacity	7	7
Transmission Gears	C Nickel	C Nickel
Engine Oiling System Capacity	1 Gallon	3 Gallons
Size of Wheels and Tires	36 x 4½	34 x 4½
Ratio of Power to Weight	1 h. p. to 83.3 lbs.	1 h. p. to 66.6 lbs.
Average Weight of Cars	3,750 lbs.	3,000 lbs.
Ignition System	Double	Double
Percentage of Parts Manufactured	60 Per Cent.	80 Per Cent.
Appearance and Quality	WE INVITE COMPARISON	
Performance	Some have beaten us	We have beaten all of them
Price per Horse Power	$98.80	$67.05
Price per Pound	$1.25	$0.95
Selling Price	$4,700	$2,850

The above comparison is made on a Touring Car fully equipped less the top. The only difference of any consequence is the selling price. *Stoddard-Dayton* is the equal in every practical way and at $1,850 less money.

What a Chauffeur Knows About Automobile Prices

THERE'S going to be a grand wakin' up some day soon on automobile prices. I'm next to the game and I *know,*" said a chauffeur.

He was proudly extolling the virtues of his car to his professional brothers.

"What's the use of paying from $3000 to $5000 for a motor car?—that's what I'd like to know.

"You've got to show *me* where you fellows' cars puts it over the Mitchell.

"*I've* driven your foreign cars that cost their owners $3000 duty *alone,* and I've driven *American* cars like *Johnson's* there and *Dorsen's* that set their bosses back $3000 and $5000.

"I've *lived* in cars like *them*—*slept* in 'em—driven 'em all day long—through rain storms and over roads that were *fierce.*

"I've babied 'em up hills that they absolutely refused to take on the high.

"I've taken 'em down and put 'em together in the garage.

"I *know* 'em—know 'em *all* from radiator to tail-light and if you fellows think you can *'show me'* just where your cars have got *The Mitchell* skinned, come out on the road with me and let's *see* if you can.

"The boss paid $2000 for *this* car. She's got four of the smoothest cylinders *you* ever saw and she's got *horse-power*—35—and she's done better on hills and under all road conditions than any 50 h. p. $5000 cars *I* ever saw, and I've driven 'em all and run up against *every test you can name.*

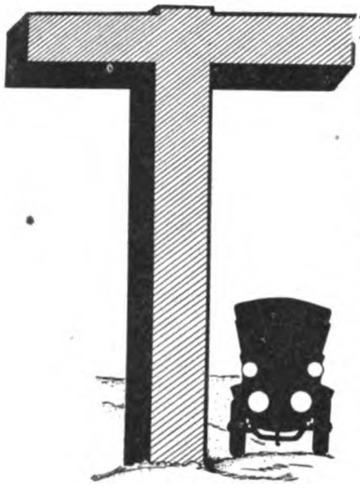
"*Your* bosses may like to pay $5000 for a car but *mine* was *wise.*

"You know there's a good *many* men in this country that shut their eyes tight on $2000 cars merely because they take it for granted that a $5000 car ought to be $3000 *better.* It *ought* to be all right—but *is* it?

"I want the chauffeur that *thinks* his car is $3000 better than the Mitchell to *prove up* with me—in *speed* or *power* or *hill climbing* or *any* old thing he thinks he's *better* at—*that's* all.

"*Yes* sir, if a man's in doubt about the *car* he wants, let him do what my *boss* did—make a 50 or a 500-mile *test* in a *Mitchell.*

"Any agent will take him out if he's interested in gettin' a car.



"That'll 'show him' what it showed my boss—and save him about $3000.

"Beg pardon, sir? Why, yes sir, write to the Mitchell Motor Car Company, 278 Mitchell St., Racine, Wis., and send 10c. for Art Catalog.

"Well, any of you fellows comin' out? I've got ten dollars in my pocket that says The Mitchell ain't $3000 behind *anybody's* car."

Member American Motor Car Manufacturers' Association.

Doesn't It Seem Reasonable to Believe

that the motorists who stick to

Morgan & Wright Tires

season after season must get a superior grade of tire service, else they would prefer some one of the other numerous brands? Fact is, that most of these "stickers to good tires" were converted to them because of actual economy in maintenance cost.

The Car of Steady Service

as applied to the

Rambler

is more than a mere phrase, it is a title earned through correct design and careful construction and proven by years of hard, constant service wherever power-driven vehicles are known.

The practical qualities that established the Rambler reputation are,—

1st—APPLIED POWER. By this we mean actual tractive force as applied to the road wheels. Owing to the straight line drive of the four-cylinder models and the direct chain drive in the two-cylinder cars, Ramblers have greater propelling force per pound than any other car on the market.

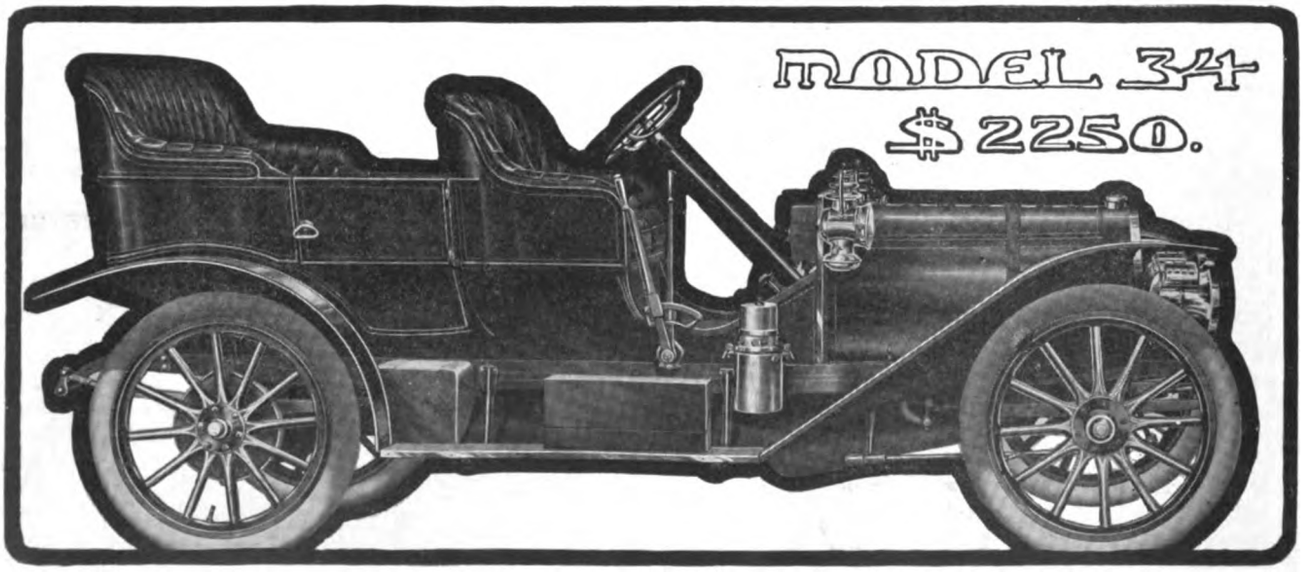
2d—DEPENDABILITY. Ramblers are built to stand the test of hard, daily service over the worst of American roads. This condition is not reached by mere weight and masses of metal, but by simple, scientific construction in which each element is stronger than the strains upon it can ever require.

3d—PRACTICAL ROAD VALUE. With the vast facilities of an enormous plant like the Rambler factory, skillfully directed to the production of two models only, greater value per dollar can be offered than is possible in a plant of lesser output.

In short, the Rambler is a car of

Power, Service and Value

Ordinary business policy dictates a careful examination of its many high qualities before ordering your new car.



Our 1908 catalog fully describing two touring cars and a high-powered roadster is at your service: write to-day.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, January 30, 1908. No. 18

ONE SECRET OF "BARGAINS" OUT

Revealed by Search for a Stolen Accumulator—But Owner Failed to Recover His Property.

A stolen ignition accumulator which in the course of events later turned up for sale at the Times Square Automobile Co.'s "bargain" establishment in New York, and which is causing a little three cornered excitement over its recovery, serves to emphasize the wisdom of owners and chauffeurs taking complete and detailed inventories of all the equipment and accessories of their cars against the time when they will find them gone to help replenish the stock of some second hand emporium.

On "Friday, the thirteenth," of December, a storage battery was taken from a car driven by Frank Taschelein, while the machine was standing in its berth overnight at the garage of the New York Motor Car Co., in West Fortieth street. How the theft was committed nobody can explain, since the garage management has watchmen on each floor both night and day, to protect its customers. Fortunately, Taschlein had a complete inventory of everything on his car, including the serial numbers on the tires, and by consulting his book was soon able to tell the manufacturer's number on the missing accumulator. After advising the New York Automobile Trade Association, the police, and the garage management as to the battery number, and urging a lookout for it, he set about on a still hunt of his own.

With the instinct of a true detective he made for the Times Square Automobile Co.'s place on Broadway. No great surprise overwhelmed him when he beheld the stolen battery displayed for sale on that concern's counter. Politely inquiring whether it was a second hand battery, and if so, to whom it had belonged, he says he was told that it had been in the car of a physician whom the clerk named as living in an uptown street. Less politely than before, Teschlein declared that the battery had been stolen from him, and to prove it he told them to call up the Trade Association, the garage and the police to confirm the identity of the number which he had given when the theft occurred.

"Well, it may be your battery, at that," he states he was told, "because we bought it from a kid," but there was no offer of relinquishing it.

After a wordy discussion Taschlein last week went to the detective bureau and got a police court summons against the Times Square outfit. Not wholly unprepared for such emergencies, however, the latter refused to respond to the summons, "on advice of counsel." The advice was good, since to swear out a warrant compelling their appearance and answer in police court would require the institution of "supplementary proceedings" to an action against the unknown thief, all of which would cost in the neighborhood of forty or fifty dollars while the battery itself is worth only about thirty-five dollars.

Taschlein's employer, not wishing to undertake litigation promising thus to exceed in cost the price of the battery, has not prosecuted the matter further, and the matter of replacing the accumulator has been put up to the garage people.

Makers to Meet at Detroit.

The annual meeting of the American Motor Car Manufacturer's Association is scheduled to be held in the Hotel Pontchartrain, Detroit, Mich., at 10 a. m., February 8th. Among other things, there will be an election of three members of the committee of management. It is also probable that the association's attitude toward future shows, which is a present cause for speculation, will be defined.

Parts Company Locates in Cleveland.

The Auto Parts Co., backed by W. B. Drown and William B. White, has opened for business in Cleveland. The company is located on Euclid avenue, near East Eighteenth street.

ALL READY FOR THE RETAILERS!

Their National Association is "Born"—Title Chosen, Manager Selected, Dues Fixed—Only Members Lacking.

If the National Retail Dealers Association does not "watch out," it will find its occupation gone. The "Association of Automobile Dealers of America" is on its scent. The N. R. D. A. was regularly organized by bona fide retailers during the Chicago show there in December last. The other "association" was not organized at all. It was simply born by the wave of a magic wand, in that house of magic on West Forty-second street, New York, styled the Spalding building, where only Alfred Reeves is an ordinary manager; practically every other man is a publicity promoter or "accelerator of automobile or public opinion," or a promoter, accelerator, organizer or magician of some sort, or very willing to be employed in such capacities.

The magicians who caused the "Association of Automobile Dealers of America" to arise from the hat are Charles A. Wardle and John R. Eustice. Until recently, Wardle was chief of the Association of Licensed Automobile Manufacturers' agency bureau. When he was relieved of those duties, the law of gravity attracted him to the Spalding building. He thought it a shame that all the knowledge and experience that he had acquired should go to waste and accordingly "got busy." He called Eustice to his aid, and together they outlined a national association of dealers, which shall require a manager and assistant manager, selected a name—and the manager—for it, and secured the indorsement of a number of friendly retailers. Eustice, who is a facile wielder of the pen, then heralded the news to the world.

"There is every possibility that the 2,000 retail automobile dealers in the United States will soon be enrolled in a national organization, with a wide sphere of useful-

Digitized by Google

ness," he said. "While this interesting movement has just become known, the movement has been under way for some time and the plans are well advanced. Ten of the largest automobile dealers in this country located in as many big cities, make up the committee on organization.

"In organizing a national association the automobile dealers are following the lead of many other retail trades. The committee on organization has decided on the name "Association of Automobile Dealers of America," and has chosen as manager Charles A. Wardle, who is undoubtedly the best posted on the automobile trade, and well known to all dealers."

When "undoubtedly the best posted in the automobile trade" was sought for specific information, he was found in company with Mr. Eustice. Wardle seemed quite anxious that his history and qualifications should be known. He returned to that subject several times, among other things explaining that he had enjoyed "four years training under George H. Day, the best organizer the world had ever known."

Asked if the association had held any meetings, he answered in the negative, but added that "conferences" had been held in Chicago and New York, at which dealers from ten different cities were present."

Would the "A. A. D. A." conflict with the National Association of Retail Dealers, formed in Chicago? Although the latter organization formally chose its title and elected officers at the Chicago meeting, Wardle did not appear to think that anything of the sort had been done, or, if so, that it was merely an echo of an old association that had proved a failure.

Between them, Messrs. Wardle and Eustice, summarized the purposes of their organization about as follows:

To make serious efforts to find markets in various parts of the world for second hand cars, to be accomplished by advertising extensively in order to bring buyers and sellers together.

To interchange information relative to trade conditions, also statistics and general information of mutual advantage.

To look after traffic conditions, rates, cars, etc., in the interests of the dealers who are required to pay the freight.

To co-operate with the manufacturers to the end that they, the manufacturers, may have the support of a large, organized, widely distributed body working together as a unit—sort of an E Pluribus Unum.

To keep records of salesmen, chauffeurs, mechanics, washers, etc., for the information of its members, "so that a dealer in Philadelphia, for instance, may not have a car destroyed by a New York washer who poses as a mechanic."

To keep track of the shifting element of the industry so that the Kansas City retailer may know the character of the Boston chauffeur who applies for work.

The dues will be $25 a year. Two thousand dealers at $25 per year equals $50,000, quite sufficient to meet the requirements of any manager, however well posted.

Local trade associations are not to be antagonized, and though they will not be admitted to membership in the A. A. D. A. their members as individuals are eligible.

Wardle volunteered the information that he had already leased an office and had an option on two more rooms to provide for expansion.

The Week's Incorporations.

Peoria, Ill.—Thacker-Brereton Co., The, under Illinois laws, with $5,000 capital; to manufacture and deal in automobiles. Corporators—J. F. Thacker and J. T. Hunter.

New York City, N. Y.—Niagara Livery & Motor Car Co., under New York laws, with $5,000 capital. Corporators—William Burrows and Fanny E. Burrows, Astoria, N. Y.

Camden, N. J.—Rowe Motor Co., under New Jersey laws, with $100,000 capital; to manufacture and deal in automobiles. Corporators—John A. Riggins, Leon Berry and John M. Tobin.

Philadelphia, Pa.—Philadelphia Taxicab Co., under Pennsylvania laws, with $200,000 capital; to operate taxicabs. Corporators—L. T. Layton, secretary-treasurer, and Joseph Kleckner, president.

Dover, Del.—Schmidt Electric Motor Chair Co., under Delaware laws, with $500,000 capital. Corporators—I. W. Schmidt, New York City; C. B. Walter, Brooklyn, and W. I. N. Lofland, Dover.

Jersey City, N. J.—Rutherford Rubber Co., under New Jersey laws, with $300,000 capital; to make all kinds of rubber tires. Corporators—H. O. Coughlan, L. H. Gunther and J. R. Turner, Jersey City.

Newark, N. J.—Rotary Internal Combustion Motor Co., under New Jersey laws, with $200,000 capital, to make engines, power vehicles, etc. Corporators—J. Hokanson, M. Hoffmann, O. Anderson, and R. Baker, all of Newark.

Terre Haute, Ind.—Wabash Auto & Electric Co., under Indiana laws, with $10,000 capital; to deal in automobiles and conduct garage. Corporators—Frank S. Lewis, Alanson Hays, Virgil Pounds, Fred P. Giffel and Theodore P. Frank.

New York City, N. Y.—George V. Lyons Motor Co., under New York laws, with $3,000 capital. Corporators—Marie A. Lyons and George V. Lyons, 2384 Broadway; Andrew G. Dickson, Jr., 29 West Thirty-fourth street, New York City.

New York City, N. Y.—N. S. U. Motor Co., under New York laws, with $10,000 capital. Corporators—Gottlieb Banzhaf, Neckarsulm, Germany; Eugene Kircherer, 206 West Seventy-sixth street; Carl L. Schurz, 49 Wall street, New York City.

New York City, N. Y.—Hotchkiss Import Co., under New York laws, with $5,000 capital; to deal in automobiles. Corporators—James M. Bessey, 66 Broadway; Charles N. Foster, 34 New street, New York City, and John A. Breitbach, 1332A Fulton street, Brooklyn.

In the Retail World.

Renault Freres have opened a branch agency at 1549 Michigan avenue, Chicago. C. T. Ziegler is in charge.

W. L. Hibbard, president of the Hibbard Automobile Co., Milwaukee, has disposed of his interest in the concern and has retired. His successor has not been named.

A new brick and stone garage, 50x140 feet, will be erected by the Wabash Auto & Electric Co., of Terre Haute, Ind. When completed the concern will move from its present location at 925 Wabash avenue.

Fire caused a damage of $8,500 in the garage of the Johnson Automobile Supply Co., 4,390 Olive street, St. Louis, January 17th. The largest item was a $4,000 touring car belonging to the Sperry Mfg. Co.

Ground has been broken in Newark, N. J., for the new garage to be erected by J. W. Mason, at 350-352 Halsey street. The building, which will be two stories high, will be ready for occupancy by April 1st.

The Johnson Automobile Co. has opened a garage at 122-124 East Main street, Marshalltown, Iowa. W. W. Johnson, A. L. McKean, and George C. Shugart are named as the organizers. Ford and Mason cars will be handled.

Leigh, Neb., is real proud as it shortly will be able to boast of a garage, the only town of its size in the State to possess such a convenience. S. B. Hoelsey is remodeling the building adjoining the postoffice for the purpose.

The Bergdoll Motor Car Co., of Phildelphia, has acquired the large garage and property at the northeast corner of Broad and Wood streets, that city. The acquisition is in the nature of a transfer from Louis Bergdoll, who had bought the property.

Directors of the St. Louis Auto Exchange Supply Co., doing business at 3916 Washington avenue, St. Louis, have petitioned the circuit court to dissolve the company, as it cannot meet its obligations and is doing a losing business. The company was incorporated only about two months ago with $30,000 capital, by Charles J. Lewis, president; Fred N. Argo, secretary; J. E. Brennan, treasurer; Robert J. Thompson, H. P. Wells, Hugo Koch, and A. M. Work. The petition alleges that John W. Baker, who promoted the company did not pay $2,000 for stock which he subscribed.

New President for Kansas City Dealers.

H. E. Roodledge was elected president of the Kansas City Automobile Dealers' Association, at its annual meeting last week. The office has been vacant since the resignation of P. B. Doddridge. C. F. Ettwein was chosen vice-president, E. P. Moriarity secretary, and W. S. Hathaway and G. L. Walls directors.

KNOX CREDITORS TO NAME OFFICERS

Appoint Nominating Committee to Choose Successors of Present Incumbents—Assignee Renders Report.

About 40 of the preferred stockholders attended the meeting of the Knox Automobile Co., Springfield, Mass., on Tuesday last, at which Assignee Mayo practically turned over the company to them for reorganization.

The stockholders, who became such by virtue of having accepted stock to the amount of their claims, did not, however, elect new officers as was anticipated. Instead, what is practically a nominating committee was appointed to decide whose resignations shall be accepted and to name their successors and the additional directors called for by the terms of reorganization. This committee is made up as follows:

Alfred N. Mayo, chairman; Robert W. Day, representing the Springfield National Bank; Edward Pynchon, representing the Chicopee National Bank; H. B. Stedman, representing the Hartford creditors; George A. Yule, representing the Western creditors. It is reported that the committee will advise the election of a new set of officials from top to bottom, with but one probable exception.

The report of Alfred N. Mayo as trustee of the company from July 22, 1907, up to January 25 last, which was rendered, showed that the receipts during that period had been $232,368.44, while the expenditures were $226,262,.51, leaving a cash balance of $6105,93.

The receipts were made up of the following items: Cash on hand July 22, 1907, $345.37; received sundry old accounts, $22,-721.31; sales of cars, $130,471.24; sales of parts, $48,362.49; deposits sales of cars, $3,800; loans (notes discounted), $25,000; rent, $783.34; miscellaneous, $884.69.

The expenditures were as follows: Preferred claims, $10,954.30; Greenwood Bros.' second claim, $7,000; fractional claims (creditors), $11,638.71; pay rolls, $103,009.20; account branch houses, $9,609.29; show expenses, $5,634.01; sales traveling expenses, $2,897.51; guarantee expenses, $834.61; advertising general, $2,189.61; insurance and water tax, $664.68; miscellaneous, $3,362.65; freight and drayage, $3,759.39; new materials, $64,705.55; cash on hand, $6,108.93.

Jeffery Adds to His Real Estate.

Within the past two weeks six more acres of ground, adjacent to the factory in Kenosha, have been purchased by Thomas B. Jeffery & Co. The ground area now measures one-half mile from east to west and one-half mile from north to south. The increased demand for the Rambler has made necessary the acquisition of more space for the enlargement of various departments and the addition of others.

O K Fails to Live up to Its Title.

The O K Machine Co., Buffalo, N. Y., makers of automobile specialties, was thrown into involuntary bankruptcy on Thursday last, W. L. Frye, secretary of the company, admitting its inability to meet its obligations. George D. Pine, Post & Lester, the Simmons Hardware Co., and the Dragon Automobile Co., were the petitioning creditors. Their claims total. $680.50.

Incorporates to Make Meteors.

The Meteor Motor Car Co., which makes the Meteor car at Bettendorf, near Moline, Ill., took out its papers last week, the capitalization being $50,000. Arno L. Petersen is named as president; Henry F. Petersen, vice-president, and F. W. Speers, secretary-treasurer. In addition to the officers the directors are C. N. Voss, J. H. Haas and Max D. Petersen.

Duplex Ready to Leave Roseland.

The Duplex Motor Car Co. has been formed in Roseland, a Chicago suburb, and already it is seeking a better location, several factory sites being in view. The officers of the company are: R. M. Hanson, of West Pullman, president; C. M. Hanson, Chicago, secretary; Ed. Torguerson, Roseland, treasurer. At present their shop is at 228 W. 111th street.

Midland Completes Its Organization.

Officers have been elected by the Midland Motor Co., Moline, Ill., as follows: President, C. H. Pope; vice-president, E. H. Guyer; treasurer, A. E. Montgomery; secretary and manager, H. E. Walton. The Midland company recently took over the plant and assets of the Deere-Clark company.

One More Big Garage on Broadway.

The Palmer & Singer Mfg. Co. are this week taking possession of their new building at 1620-1624 Broadway, New York, from which address the Simplex and three lines of Palmer & Singer cars will be marketed. It is one of the largest garages on Broadway, having accommodation for more than 150 cars.

Chapin En Route for the Coast.

Roy D. Chapin, general manager of the E. R. Thomas Detroit Co., has departed for a sweep of the country which will extend to the Pacific coast. As he has made the trip before, he is not visiting strangers or strange territory.

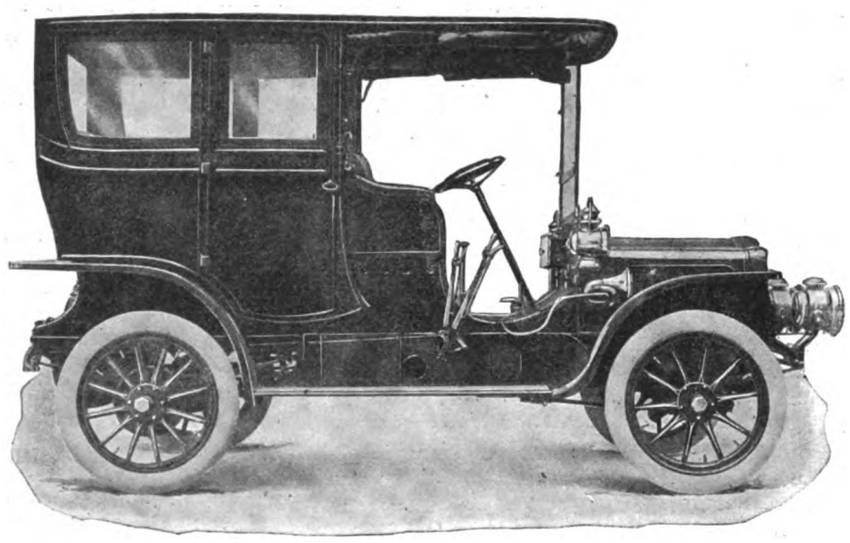
Draper Leaves Wayne for Mora.

J. S. Draper, for three years sales manager of the Wayne Automobile Co., Detroit, has resigned to accept a similar position with the Mora Motor Car Co., Newark, N. J. His change becomes effective February 1st.

"THE ROBBERS ARE ON THE RUN!"

New Haven Can Tell Who They Are—Dream of a Big Automobile Factory Fades Away.

Many New Haven business people think that the number implied in the advertising catch-phrase, "The Robbers are on the Run!" which has for some time appeared in local papers, should be changed to singular. They opine that it should read: "The Robber is on the Run!" Incidentally, the police of the Connecticut city are looking for one John E. Fulton, who with his son, Rufus, operated as the Connecticut Automobile Company.



According to New Haven advices Fulton, who claims to be a descendant of the inventor of the first steamboat, came to that city about the first of October and stated that he was going to make three styles of automobiles, which would cost $350 each. He said the cars could be built for less than $250 and would be better than many machines costing over $2,000. As if to prove it he advertised under the catch line, "The Robbers are on the Run."

The first act of the Fultons upon arriving in New Haven was to take a ten years lease of the Armstrong factory in Congress avenue near Howard avenue. Fulton then called upon several contractors who he informed that he had the lease and that he had received it at a low figure with the understanding that he was to make all the repairs. Brainerd & Benson were given the contract to do the joiner work. Michael Rakieten was given the painting order, and E. C. Bedell was ordered to go ahead with the plumbing. Each was told that by the first of January 700 men would be employed making the machines. Work amounting to over $1,000 was done by these three concerns and they were told that they would be paid on January 9. As there was no money on that date, Brainerd & Benson attached the machinery at the plant and took it away. Deputy Sheriff Dejou acted. Acting for some of the employes, another deputy sheriff took ten roll top desks from the office, and another official removed the typewriters, which were said to be on lease.

Then some more of New Haven became interested in the affairs and they learned that in all the Connecticut Automobile Co. had employed fifteen men, but that not a single automobile had been turned out. Also that a lot of machinery that had been ordered lay in the freight house, waiting to be paid for before it could be delivered. Of the fifteen men employed, the engineer is said to be behind $80 in wages and a cabinet maker $100, and it is stated that even the elevator boy was not paid. There has been a steady stream of creditors to the place since the departure of the Fultons became generally known.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exengencies of street traffic without any charging of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

For the Integrity of Amateur Sport.

It is to be hoped that all other of the district associations of the Amateur Athletic Union and all other sports governing organizations—will follow the example of the Pacific Association of that body and appoint "automobile commissioners" to "keep tabs" on motorists who compete for cash or against professionals and who then seek to be accepted as amateurs in other sports.

Such action will be in the nature of serving the sport of automobiling a better turn than some of its own adherents will permit themselves to see. As at present constituted, it is too much a "trade game."

Although the superb indifference of most of the American Automobile Association's officials to all opinions and suggestions save those that emanate from the "inside" has been the means of alienating the support of not a few of their erstwhile upholders, it is possible that after a few score of the men who compete under A. A. A. rules receive their proper brand, that of "professional," and find the door of amateur sport slammed in their faces, the A. A. A. administration will not fly in the face of public sentiment and make a mockery of amateurism, which is but another definition for genuine sport.

If automobile competition is not sport, it is up to the A. A. A. properly to define its status. It is generally written of as sport and it certainly takes the form of public contests of either speed, skill or endurance, which are the elements that contribute to sport. The old idea that sportsmanship is measured solely by athletic prowess has been or is being rapidly dissipated. Whatever is classed as sport, regardless of the implements employed, begets sportsmen and the automobile competitor who is free from trade entanglements and who competes for sport's sake and not for advertising or the money an event may net, should welcome the action of the A. A. U. since it assures him his proper distinction—that of a genuine sportsman, which best is expressed by the term amateur.

It would seem that the American Automobile Association can well afford to take a stand for real sport by purging its rules of their present absurd inconsistencies, some of which were borrowed from abroad and the remainder inserted for the benefit of a few men of wealth.

Reform the Road Law!

Governor Hughes, in his message to the New York legislature, says:

"In making the large expenditure which is contemplated for improved highways the object is to execute a comprehensive plan in the interest of the whole State, furnishing through lines connecting centers of population and proper lateral lines to provide each section with adequate means of communication."

The Governor is quite right as to the object of spending the $50,000,000 to be gotten from the bond issue, but that object is not being attained under the present so-called Higbie-Armstrong law, under which boards of supervisors petition the State engineer for any road they want built. Sometimes this road goes from nowhere to nowhere; sometimes it is an isolated stretch of two or three miles; sometimes it is built parallel with another good road, and all because one or two persons have influence with the board of supervisors. It certainly seems unwise to go on spending money under the Higbie-Armstrong law instead of providing a system such as the Governor favors, which will connect the large centers of population and furnish proper lateral lines to provide each section with adequate means of communication.

The Higbie-Armstrong law has served its time. The small stretches of good road built under it were useful object lessons, but now the taxpayers should demand that good roads be built with system.

Town Cars and Taxicabs.

At present the attraction of the light weight, closed vehicle of the town type, is strong upon the makers, and with the development of taxicab services, and the exploitation of scores of companies to handle them, or that hope to handle them, there is at once a tendency to overdo the thing, and to branch out in the wrong direction. In the first place, the status of this type of vehicle is not as yet sufficiently well defined to warrant hasty judgment as to the legitimate demand for it. For another thing, experience in building pleasure cars is apt to breed over-confidence in constructing machines which, though nominally similar in many respects actually differ from them in the material point that they must serve in the rigorous capacity of commercial utensils.

As town cars, such machines must be light, moderately short in wheel base, nicely balanced as to suspension, handily contrived as to passenger accomodation, simple in construction, economical in maintenance, and as low in cost as is consistent with sound building and a rational profit between producer and consumer. Furthermore, they must have a motor possessing even torque, freedom from vibration and great power of acceleration. The latter requisite is most important, since it is to be presumed that such a vehicle is to be used almost exclusively in closely crowded traffic, where quick starts and quick stops are the only means of increasing its average rate of movement. Accelerative power, thus becomes tantamount to speed.

Another use, closely allied to that of the town car, yet sufficiently different from it to alter somewhat the requirements governing its construction, is that of the suburban car, which, unlike the "demi-route" of France, is designed to answer to all the practical purposes of the useful horse-drawn station wagon. Up to the present time only one or two makers in this coun-

Digitized by Google

try have essayed the construction of such a machine.

A vehicle of this description, intended to take up work which is too limited to be economical for the large touring car, and too exacting to be longer fulfilled by the horse, must have general proportions similar to those of the town car, must have most of its excellencies, but requires less accelerative power, and more speed capabilities, though not necessarily high speed power. Unlike the typical town car, such a machine requires considerable road clearance, and must be made at sufficiently low cost to make its use attractive to the present owner of a large and powerful car as well as to the person of moderate means and an insistant need of safe and economical daily transportation over short distances.

Here are two types of vehicle, closely related in many respects, as regards ideal construction, yet differing somewhat in the nature of the service they are required to perform. For both there is a probable demand of considerable magnitude, and for both an equal chance of commercial error of the gravest nature in building for sale rather than for use, or in judging too lightly of the stern requirements of machines which are to be operated the year round independent of highway and weather conditions. The field is a most attractive and promising one, especially since the sober purpose involved relieves the maker from the necessity of attempting to set or follow fashions at all closely and opens the door to quantity production. Probably it is as big an opportunity in a subsidiary way as exists in the industry today. But it must be handled wisely and well, if the too alarming consequences are to be avoided.

How Chauffeurs May Help Themselves.

It long has been painfully apparent to any one coming into close contact with professional chauffeurs and giving ear to their complaints that they consider themselves to be a much abused class who are unpopular with the world at large, though for reasons beyond their ken.

A frequent topic for conversation, in the room set apart for their use in public garages, or when two or three are gathered under the shed provided for their protection at a road house, is the lack of consideration shown them by the police in charge of traffic who invariably compel them to turn around when they try to "beat the line" or travel on the wrong side of the thoroughfares.

Of course this is the veriest rot, though it is only the wail that is to be expected from a type of driver who by their actions and supercilious demeanor give the impression that they are of a favored class to whom the public and the law must give way.

If chauffeurs would free themselves from the bad name that is theirs and would try to deserve the tolerance of the public they could make a good beginning by considering the horn as a means of warning people of their approach rather than as instrument with which the frighten the public from their course. And at the same time a little thought for the horse struggling with a heavy load would prompt a man with the least claim to being human to give it the right of way rather than to "hog" a course which would compel the animal to come to a stand still.

These are only two incidents that are repeatedly coming under the direct observation of the public, and their correction or elimination would do much to make people feel a little more kindly toward the drivers of cars, and it may be that if chauffeurs were sincere in their desire to deserve a good name in the community a little thought would suggest to them that they are acting towards others in a way that they would not care to be acted toward if conditions were changed and they were to become the man in the street.

Making a Bad Beginning.

Why will men engineering a movement herald it to the world while it is yet "unfit for publication," so to speak?

The so-called Automobile Dealers' Association of America is a case in point. A live organization of the sort may be made to serve some excellent purposes, but when the promoters of it, who are not retail dealers, make it so abundantly plain that the chief inspiration of their efforts is the desire to provide fat jobs for themselves, how can they hope to escape criticism?

National associations are not drawn out of hats and the plan of selecting a name, "engaging" a manager—who, of course, is one of the promoters—and fixing the amount of dues before organization actually has been effected, is too suggestive of "stacking the cards" and "giving away the game" to deserve approbation, particularly when a bona fide association of the sort already is in existence.

COMING EVENTS

February 1-8, Providence, R. I.—Show in Providence State armory.

February 3-8, Kansas City, Mo.—Kansas City Automobile Dealers' Association's annual show in Convention Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory.

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association's show in Central armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

February 22, Boston, Mass.—Bay State Automobile Association's 150 miles endurance run to Providence, Worcester and return.

February 24-29, Portland, Me.—Annual show in the Auditorium.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 7-14, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

We have no doubt that the promoters of the retailers' association will consider criticism as distinctly bad treatment, but when there is a right way and a wrong way of doing things and they choose the latter, the fault rests with themselves.

The American Automobile Association has issued an appeal to all owners and users of automobiles, and to manufacturers and agents, asking for support of the Federal Registration Bill introduced at the present session of Congress by the Hon. William W. Cocks of New York, and known as House Bill No. 428. It is the measure designed to permit citizens of the United States to enter any State in the Union without payment of an "admission fee." The man who has wearied of being "held up" and who fails to write the Judiciary Committee of the House in support of the bill must blame himself if relief is not forthcoming.

AMBASSADOR AT A. C. A. BANQUET

M. Jusserand Talks of French Triumphs, Hippogriffs and Dust Problems—Depew and Others Also Speak.

Thanks to M. Jules Jusserand, French ambassador, those overworked coinages, "whizz wagon," "benzine buggy," "gasolene goer," and the remainder of the tribe of "smart" definitions of the motor car may be laid on the shelf and given a long and much needed rest. At the annual banquet of the Automobile Club of America on Saturday evening last, 25th ult., M. Jusserand contributed an uncamphored and polite substitute for such terms. He styled the automobile "the modern hippogriff." The ambassador was the chief speaker of the occasion. It follows that the band played the "Marseillaise."

The banquet was the first held in the new club house on West Fifty-fourth street, New York. The dining hall was tastefully draped with flags and bunting, with the American and French National emblems intertwined. All the tables bore floral decorations and attractive souvenirs were at every plate. Every seat was occupied. Besides M. Jusserand, those at the guests' table were Senator Chauncey M. Depew, Gen. Nelson A. Miles, Gen. George Moore Smith, Col. John Jacob Astor, the Rev. Wilton Merle Smith, Patrick Francis Murphy, Henry Sandrum, Augustus Thomas, Dr. Schuyler Skaats Wheeler, Dave Hennen Morris, Job Hedges, Albert R. Shattuck, Charles Jerome Edwards and Oliver A. Qualye. Altogether, between three and four hundred persons were present.

President Colgate Hoyt acted as toastmaster and preliminary to his remarks proposed the health of the President of the United States and of the President of France. The toasts were drunk enthusiastically, while the band played the "Star Spangled Banner" and, for the first time, the "Marseillaise." Then Mr. Hoyt congratulated the club on the new home, paid a deserved tribute to the building committee, and said that it will have cost not far from $800,000. Of that debt $40,000 has been wiped out in the past year, thus reducing the mortgage obligation to $610,000. The club membership now is 1,511 as against 1,200 a year ago, and the waiting list is a long one.

When Mr. Hoyt introduced Ambassador Jusserand the orchestra again struck up the "Marseillaise." M. Jusserand, who was seated next to Senator Depew, replied to the toast, "France, the Mother of the Automobile."

Not unnaturally he sounded the trump of France and Frenchmen and spoke of radium, dirigible balloons, and the other good things they had discovered, and said the secret of his countrymen's success in building automobiles is that "they work slowly and with patient care—a national disposition fortified by custom."

"It was Nicholas Joseph Cugnot, an officer of the Engineer Corps, who built the first automobile in 1765," said the Ambassador. "That curious old machine still exists and may be seen to-day in the Conservatoire des Arts et Matiers in Paris. Its speed was three miles an hour and it had to stop every fifteen minutes to fill its boilers—but it moved. Cugnot died in poverty, neglected and forgotten, in 1804.

"The reinvented automobile has conquered more of the world than did Alexander the Great. You will find automobiles in Madagascar and in Senegal. It inspires passions. People have been known to dispose of their property to procure one. There is romance about it. Its possibilities are exhilarating.

"This modern hippogriff is king of the road, with a tendency, I fear, of becoming autocrat, too. There lies a serious danger. The pride of youth and success which shines in its glaring eyes must not lead it astray, and means must be found to pacify and befriend the slow walker, the antiquated wagon driver, the stay-at-home ground tiller, who constitute, after all, a majority. Certain means which have been unwittingly employed to silence such people should be carefully avoided.

"One of the most important problems nowadays, and one on which greatly depends the future popularity of the art, is the problem of dust. The art has no greater enemy than dust. Dust spoils the pleasure of all who use the road, spoils the machine, spoils the crops, and the growing animosity existing in certain provinces against automobilists has no greater cause. Certain it is that gardens and orchards bordering much frequented roads have lost all value, owing to the dust, which prevents the plants from breathing and kills them. I know of handsome villas now for sale because uninhabitable from the dust raised by the automobiles—for sale, but unsalable. The problem must be solved, dust must be done away with."

Senator Depew spoke to the toast "America," the User of the Automobile." He related some of the marvels of transportation that had happened during his life time of more than 70 years, dealt out some figures relating to the automobile industry, and to highway work, and spun a few humorous stories. He mildly advocated speedways "to protect the public and develop the industry," and on the subject of speed said:

"The last to take up the automobile have been railroad men. They are accustomed to expect roadbed, ties, rails, wheels and the machinery of the locomotive to be perfect for 20 miles an hour and upward. The automobilist does his forty or fifty upon an ordinary highway with only a rubber tire and a pneumatic tube between him and eternity. If he picks up a nail or his steering gear gives out the morning paper tells the rest and mourning friends lament his indiscretions.

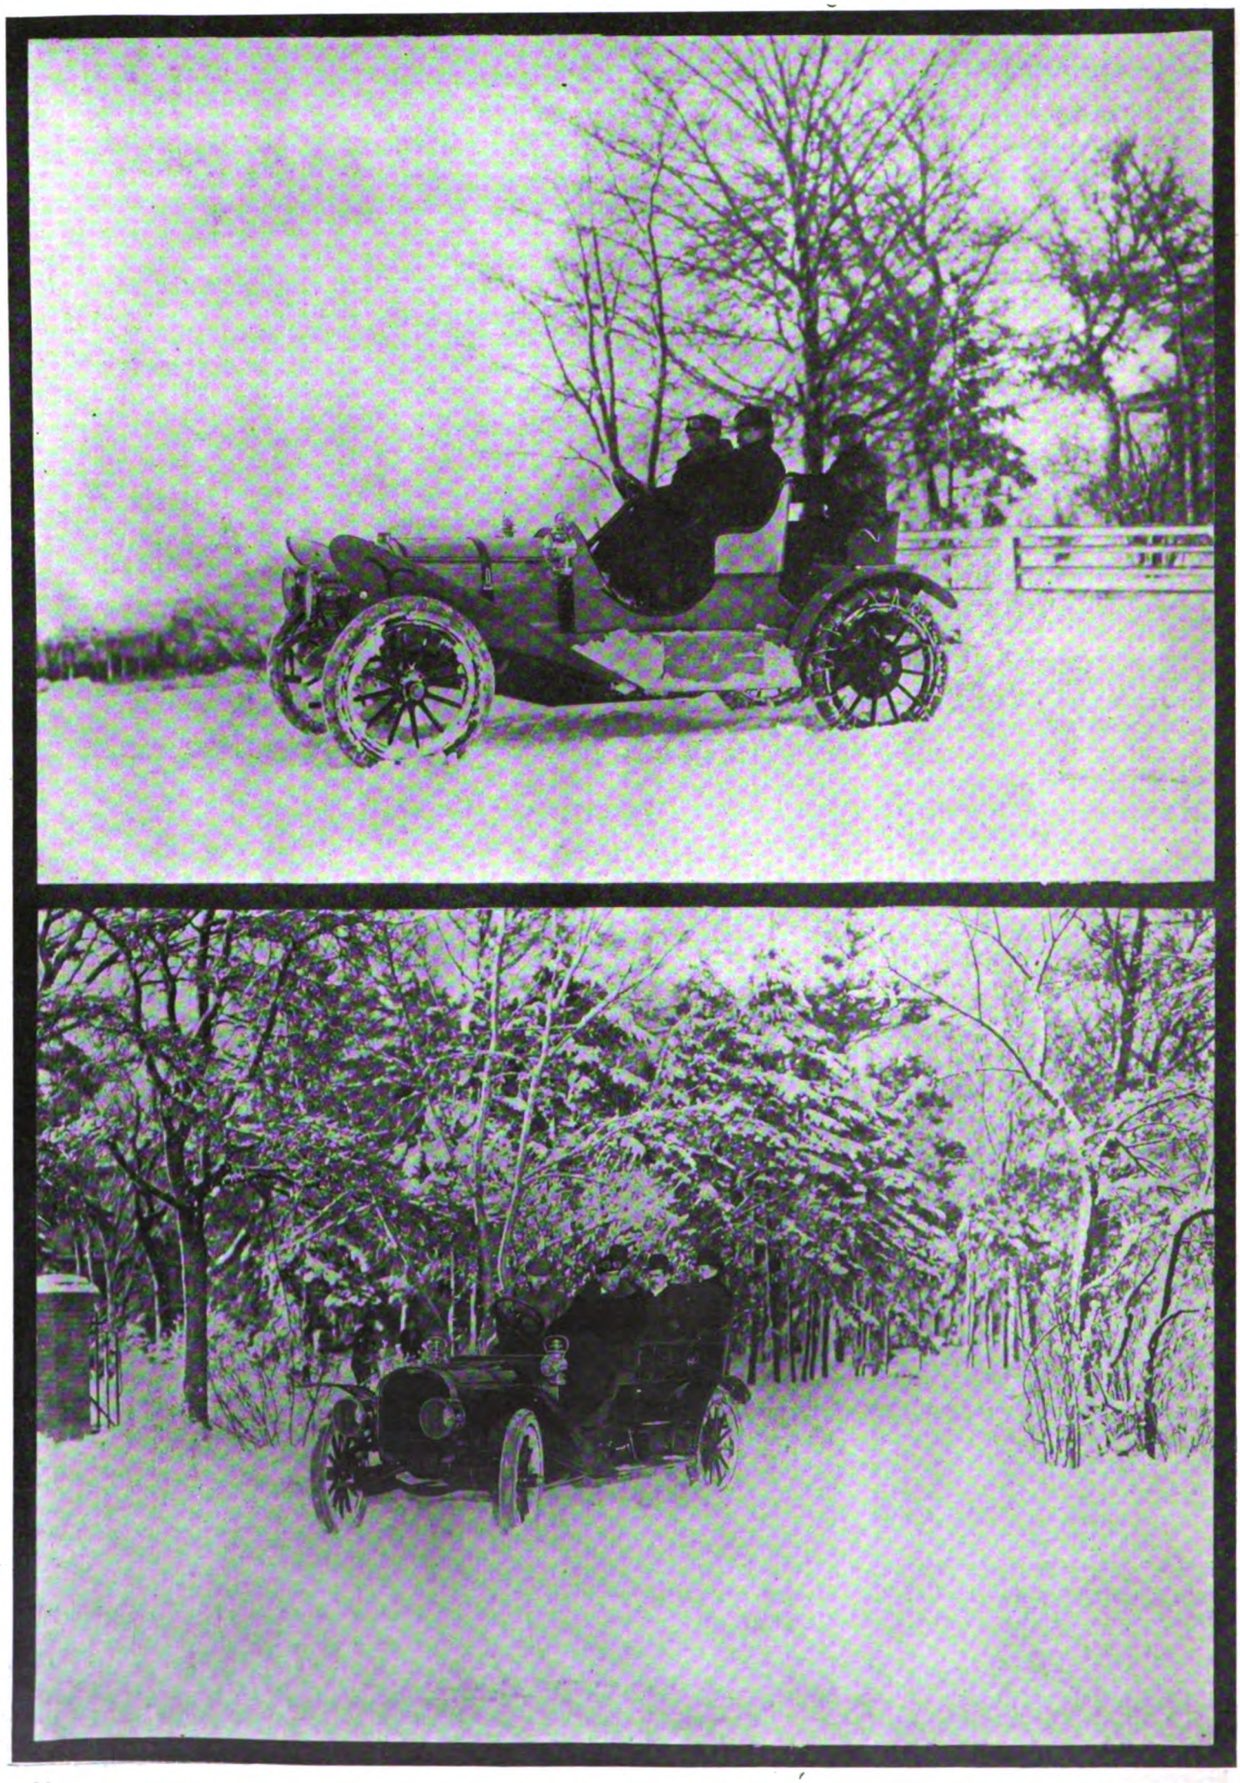
"Stevenson, the great English engineer, was asked what the difference was in danger between fifty and a hundred miles an hour with the locomotive. He said, "None, because if you leave the track you will go to hell with either." The condition with Stevenson was that you must go off the track, but with the automobilist there are numberless conditions beside the tracks, therefore constant inspection of the machine, vigilance in its operation and proved intelligence in the driver are absolutely essential.

"On the health side I know from experience that the ozone which is driven into the lungs by riding in an open car at a fair speed is a specific cure for insomnia and nervous troubles. Sanity and level-headedness, together with healthy living, have come to those who have found it possible to live in the country and motor to their business places in the city and return to their homes."

"The Automobile and the Pedestrian," afforded a peg on which Augustus Thomas, the playwright, hung a succession of merry jests.

He complimented the French Ambassador and fell easily into speaking of Paris.

"A city," said Mr. Thomas, "where things are so very cheap that one may lead a double life for the same money."



His experiences with automobiles had been, he said, entirely from the standpoint of a pedestrian. He had noticed, though, an extremely curious thing—the way sex is so clearly drawn in chickens when an automobile comes sailing down a road. An old rooster will stop with his head on one side, eye the devil wagon, remark calmly to himself, "Hell! I've seen them things before," and step dignifiedly out of the way. On the other hand a hen will squawk and shriek and scream and flutter her foolish wings and make a terrible to do, in the end, the chances are, getting herself run over.

The automobile plays a pretty important part on the stage nowadays, said Mr. Thomas. It used to be that the property man rigged up a machine of laths and a wheel to make noises which would indicate that "the carriage" was arriving and departing. Now it is a simple matter for the property man to squeeze a rubber bulb and convey the proper suggestion by a mere "honk! honk!" He added that he was the first playwright to use a suggestion of the automobile in the drama.

Mr. Thomas ended by saying that he had never advertised any particular brand of automobile, but that he had a new play coming out, and if some manufacturer would send him a late model—well, he didn't know. He was only human.

"Automobiles" was the toast assigned to Job E. Hedges, who as usual, poked fun at everything and everyone worth poking at. Job rapidly is becoming an almost indispensible adjunct of all New York banquets.

Motor Cars as Mediums for Municipal Graft

Part II, Wherein the Grafter Acquires a Fine Large Touring Car and the Pleasure of His Relatives and Friends is Correspondingly Increased at the Taxpayers' Expense—Car and Chauffeur Placed Subject to the Order of the Grafter's Woman Friend.

My assertion last week that no form of municipal property is so largely misused and abused and so grossly and shamefully converted to private use as the automobiles paid for by the long suffering taxpayers was not lightly made.

The new "inspector," whose car I had been delegated to drive, speedily made plain that qualms of conscience did not trouble him. It is possible that the idea never occurred to him that he was misusing the car by converting it to private use and making it a medium of graft. He fell into the habit naturally. When, on the second night of his career he helped his woman friend into the car and bid me drive to a "white light lobster palace," he marked his start in the city's service smacked of remarkable boldness on the part of a new official. During his first week or so, at least, a show of conscientiousness is reasonably to be expected of a new appointee. But this was not true of this "inspector."

Conditions Grow Worse.

The end of the second day was as the end of the first and I wondered if this sort of thing was to be kept up or if it was only the usual new toy that would lose its attractiveness when it had ceased to be a novelty. I thought that this soon would be the solution of the situation and found comfort in the thought that "this wont last."

But it did last and instead of getting better it became worse. The theatre in an adjoining town was an easy run for the car, to be followed by dinner and a drive that kept me from my home until two or three in the morning, and probably later, when tire trouble, that ever present nightmare of the chauffeur, held me up for an indefinite time on the roadside, sometimes far from the help of even the feeble glow of a street gas lamp.

By this time I had an opportunity to study my new superior with the result that I concluded that he was a fine, big hearted fellow who would go to any extent for a friend and was quick to forgive an enemy. His early life had been spent far from the city, its influences and temptations, and in a place where a motor car was not only a luxury but a curiosity as well. I recall one night as we were going along one of the drives, he turned to me and said:

"Malcom, I never thought that I would see the time that I should have an automobile to do with as I pleased; I tell you it's just plain bully." And there you have the key to his character, the unaffected expression that shows his lack of appreciation of the fact that the car was given to him for a certain purpose, to be used as a means not as an end, and he failed to see it, even as he failed to realize the immense importance of his position with its responsibility to the administration and to the taxpayers, yet he was ever ready to do a favor, and was, indeed, a big, good natured boy.

Routine of Koystering.

My work soon settled down to a pretty regular routine. I met "His Highness, as I affectionately named him without his knowledge, at about nine in the morning, then a quick, hard drive about the city until noon, at which hour he had lunch at a club while I sought a cheap restaurant; then to the office until about three and afterward to some friend's house with its consequent wait of anywhere from fifteen minutes to three hours, followed by a ride to various hotels or apartments where friends were awaiting by appointment to join the party, then to some famous restaurant of the city or a suburban inn, and at times to a hotel in some town or adjacent state, after which the guests were returned to their respective homes and I was through my day's duty as a municipal chauffeur.

The car that we used was a low power, rear entrance tonneau which, without the top, was not a thing of joy to a user on a rainy day, so we put on a top of the semi-limousine type which, with its glass panels in the back, its side curtains and glass front, offered protection to the occupants. When I first saw the addition I easily prophesied that the relaxation that had been mine on rainy days was to be a thing of the past; and I was not mistaken.

I recall one night, the evening of a day of continuous rain which had left the streets in a condition easily to be imagined, and the parkways in even worse shape for driving, I had driven "His Highness" home at about six o'clock and followed him to his rooms for some purpose; I was dumbfounded when he went to the telephone and calling a friend asked him to go for a ride. As it was raining hard at the moment and gave every indication of continuing for the night I was not surprised that the invitation was declined and hoped that that would settle the question; but I reckoned without due knowledge of his fondness for the sport. One after another of his friends were called up with the same results until after four or five declinations there came an exception when two were found who would go—two women whom he called for and took to a restaurant preliminary to the extensive ride that followed through the parks and drives afterward. And all that time it rained as though the very heavens were hoping to dampen his and their ardor.

It was a common thing to load up the little car—which should never have had more than a light runabout body—with four or five adults and then go cruising about a hilly country with a load that was a tax on its power on the hills on even the first speed. My remonstrances were without result. His answer to them was usually something in this vein, "Well, it will go, won't it? Yes? Then keep it going until it stops." Explanations and remonstrations made no difference. It was always a case of "Keep her going until she stops."

Luxury Adds to Labor.

I had been driving him about for two months when there became available for our exclusive use a fine, big, 50 horse, seven passenger touring car. I was sent to get it and at first sight of its magnificance my spirits fell and all hope died within me. If the little, ante-dated, low powered, uncomfortable, scratched-up, noisy car which we had been using was capable of giving so much pleasure and capable of responding to such unusual demands, what could be the future of this modern luxurious equipage, and, much more to the point, what was to be the future of the chauffeur who was already being called upon for fourteen hours a day?

I had noticed that of many of the friends of the "inspector's" who had ridden in the old car only a few had remained faithful after the novelty of automobiling had worn away; and it was surprising how quickly it did wear away after they had been required on one or two occasions to walk up steep hills. But with the advent of the new car the old friends returned to the fold and to their ranks was added a liberal reinforcement making in all a number sufficient to furnish companionship at any time and of a quality so varied that any particular form of contemplated relaxation was sure to find its votaries in the ranks.

Of course, with all this running about on unnecessary journeys, that is, unnecessary from the viewpoint of the taxpayers who were supporting the equipages which they had supplied with an intention that they were to be utilized for the benefit of the municipality rather than as a perquisite of the office or the personal property of its accidental and temporary incumbent, the cost of maintenance and upkeep was vastly in excess of any reasonable sum that could

Digitized by Google

be conscientiously expended incidental to the actual mileage encountered in the performance of departmental inspection and official routine. Occasionally, the odometer would show as a result of the day's traveling a total of about 110 miles, of which possibly 20 would be a fair number at which to set the distance actually covered in the interests of the city. Later this was further reduced to zero unless in a spirit of charitableness one may ascribe as "official" the run to the inspector's house to get him before, and return him after, a pleasant excursion.

Free with Public Money.

In addition to the cost of upkeep incidental to the maintenance of a large car, aside from fuel expense and tire replacements, I soon found that a spirit of generosity prevailed which would permit me to obtain requisitions for accessories that under the former administration would have been denied. In this connection I recall an incident in which I figured during the period that I was driving a car for myself as an inspector of the department.

The horn bulb, which incidentally had done several years service, so far as I could find out—at any rate, the date of its purchase was so far in the past that no one knew from whence it had come or where I could go with the hope of finding its mate or one with the same threads—had split and was useless. I sought the proper authority with the request that I be given permission to get another if I could find one, or failing in that, be allowed to buy an entire horn at a cost not to exceed $3. The reply was characteristic of an executive who was trying to economize when spending the public's money:

"See if you can't fix the bulb. If you can't do so, I'll give you an order for another."

In contradistinction to this was the reply under the new regime when I asked permission to get a special horn which I explained would cost $25:

"Sure, if you need it, get it."

Though it may have been a compliment to me, an expression of confidence contained in an intimation that it was believed I would ask for nothing that was not best suited for the purpose to which it was to be put and necessary to a proper conducting of the work in which I was engaged, yet it was very different from the conditions that had formerly obtained and was an expense that the executive would not have incurred if it had been for his own car to be paid from his private purse. I know the man sufficiently well to make this as a positive assertion.

For some time after the receipt of the new car it was used to a limited extent in the city's service, by which I mean that it actually carried city officials who were riding for the sole purpose of performing the duties that were demanded of them by the position that they filled. But these occasions became rarer and rarer and gradually the car and its chauffeur was withdrawn from the municipal work and they became, respectively, practically the personal property and individual attendant of the inspector. They were instruments of "graft," pure and simple.

From the first I had given it out that I could not and would not be the recipient of tips or emolument other than the salary paid me by the city. My stand on this question may have caused the inspector to feel that I would not submit to being treated as a lackey and as a sop to my pride, or maybe as a tribute to my personality, I was formally introduced to the women as well as the men who were occupants of the car; and they invariably treated me as an equal—though sometimes I felt that it was graceful condescension on my part to permit it—until our destination was reached, when, if it was a restaurant or road house, they sought the guests' domain while I was left to inquire my way to the kitchen or the servants' quarters.

Meals at City's Expense.

At first it was impossible for me to seek as my proper place a seat at the tables reserved for the menials of the establishment and on several occasions I deprived myself of required nourishment rather than submit to a condition entirely foreign to me and repulsive in its suggestion that I had become a servant; but each time the deprivation had brought on a severe headache and I was forced to either accept existing conditions or resign from my position, and I chose the former.

At first it was very hard, but I found a certain satisfaction in paying for my meals and declining to permit the inspector to do it for me. It is true, and I appreciated the fact that I was being put to an unusual and unnecessary expense; unusual, because as a "city mechanic" the law required that I should work not more than eight hours a day; unnecessary, because at my home there was prepared a meal for those who were there that I could have partaken of without extra cost. But I finally had to yield even this small means of satisfaction as the eating places with very few exceptions maintained the same scale of prices for the servants' quarters that they did in the guests' rooms with the result that a simple, substantial meal was impossible under a dollar and a half and that cost coming every night was an impossible drain on a salary of one hundred a month, so I yielded even this point and it seemed to me when I signed his name to the first check that I had in fact ceased to be a city "gas engine expert" and had become a chauffeur with all that that term implies.

I had lately been receiving such a variety of orders that when one afternoon I was told to have the car at the apartments of Mrs. Blank early on the following morning I was neither surprised nor willing to remonstrate. It was raining, but I obeyed the order and at an early hour the hall boy announced my arrival.

"Mrs. Blank says that she does not wish to go out while it is raining," the lackey told me on his return. "She directs that you return to the stable and await her call."

Think of it! And I was a city employe supposed to be performing duty only for the city and taking orders only from a city official, while the stable at which I was to await the woman's call was a municipal building.

About noon the sky cleared and a telephone message from Mrs. Blank directed me to return at 2 o'clock. During the wait I had had the car washed by the department washers so that it was with a clean vehicle I met her when she appeared with Mrs. Dash and made a round of calls to be followed by a drive through the parks until 6 o'clock, when we met by appointment Mr. Space and Dr. Keen with whom we went to an inn about 30 miles away. The inspector was not one of the party. I was subject to the lady's orders; and this sort of thing happened not once, but scores of times. In fact it had become so common for the car to be put at the disposal of friends and relatives that the inspector was frequently deprived of its use and though he had a horse and buggy and a driver also assigned to him, they could not take the place of the machine nor was the buggy as comfortable, so the little car was again put in commission and a repair shop helper taught to drive it. With this added equipment I was freer than before to respond to outside demands; and I responded, too. In this connection I may relate in passing that one afternoon I was directed to take three relatives of the inspector and show them about the city; the commissioner's car and chauffeur were detailed to the use of some visiting cousins of the inspector, and the inspector's driver was ordered to hitch up his private rig and take a sister for a drive, which is in the nature of "going some" at the taxpayers' expense.

Sight Seeing for Friends.

In the course of this sort of duty I had an amusing experience with one of the inspector's friends from a distant town—probably some place where an automobile was a rarity and the chauffeur a species entirely unknown; I had been given the usual order to take him out and show him the city as well as drive him to any places to which he might ask to go.

We had covered the city very thoroughly, had gone to the points generally visited by strangers, the drives and parks had been traversed, the famous residences had been pointed out as well as the homes of various notorious citizens whose intimate relations with the county attorney and several grand juries had been the means of making anything associated with them of interest, and finally the time came when he had to leave for a club appointment. I drove him to the designated address; as he left the car he

Digitized by Google

came, and, reaching in his pocket he remarked:

"Well, I intend to pay my fare."

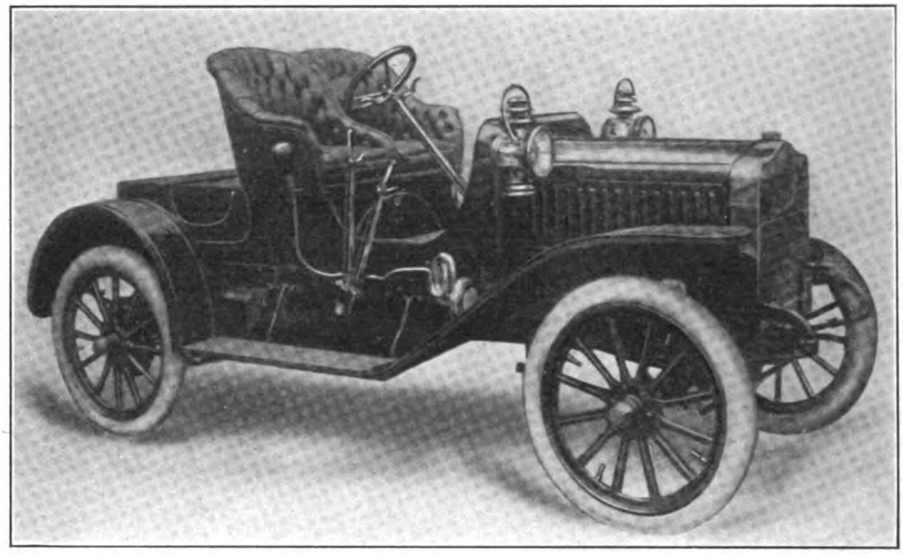
He may have been a humorist or this may have been the occasion of a pathetic incident. However, I accepted the five-cent piece that he offered: I still have it—the first and only tip that ever came into my possession. I solomnly assert that the narration of this afternoon's work and remuneration, improbable as it does appear, is "the truth, the whole truth and nothing but the truth."

It struck me as being so very unusual that I entered it in my diary, from which I purpose drawing some extracts next week.

Facilitating Use of Electrics.

In connecion with the development of the vehicle industry one particular setback has been encountered in the charging problem, which always has been more or less of a hindrance to the small and local user, though the owner of a large equipment seldom has counted it an impediment to successful working. Although the electric vehicle makers and dealers always have been active in teaching the most economical use of their product, not as much has been done to lighten the burden of the charging costs as might have been the case. The policy of the Studebaker Automobile Co., South Bend, Ind., recently undertaken, to market a mercury arc rectifier in connection with the sale of its vehicles, therefore marks a notable departure.

The rectifier is used to modify the alternating current ordinarily supplied for lighting purposes, in such a way that it may be used directly to charge the vehicle batteries. Considerable equipment which would otherwise be required is thus done away with in localities where only the alternating current is available, and the average running expense is reduced from $25 or $30 per month to $8 to $10, as is claimed. The rectifiers employed, it is said, are the first to be handled commercially by any firm of automobile makers, are similar in principle to the Hewitt device brought out several years ago, and are made on specification for the company by the Westinghouse Electric Co.



Boston Planning Taxicab Service.

Boston has one taxicab. It is the forerunner of others, if the plans of the Boston Taxicab Co. can be materialized. This company, which is a subsidiary of the New York Taxicab Co., is of recent incorporation, and has filed with the Boston police commissioner an application for approval of its rates and allotment of stands. There has been some delay in this matter for the schedule of the charges for taxicabs is different from anything in the line that has heretofore been used in Boston, and the police authorities have been obliged to give it considerable study to see that it does not conflict with the established rules relating to public vehicles.

RACINESS IN A NEW RUNABOUT

Improved Features in Latest Addition to the Maxwell Line—General Specifications of the Car.

Still another new model has been added to the rapidly growing line of vehicles which are produced under the systematic management of the Maxwell-Briscoe Motor Co., Tarrytown, N. Y. Model K, as the newcomer is known, is very similar to Model D, insofar as chassis construction is concerned, the most noteworthy points of difference between the two being in the slight modification of the frame which is made necessary by the greater rake of steering column which is one of the features of the new type. The body conforms to the popular runabout pattern, with folding chauffeur's rumble in the rear, which is sufficiently large to accommodate two persons if necessary. When collapsed, the back fits nicely into the deck, leaving a smoothly finished exterior. Another improved feature, noteworthy in this connection, is the placing of the tool box in the extreme rear of the rumble, the hinge of the cover serving as the hinge upon which the rear seat folds up or down.

NEW MODEL MAXWELL RUNABOUT

The general specifications of the chassis are: Four-cylinder vertical motor, with cylinders of 4¼ inches "square" dimensions, rated output 24 horsepower. The three-point, unit construction for engine and change gear set, which is a well known Maxwell feature, is retained as a matter of course, as is the multiple disc clutch. The interlocking arrangement preventing careless misuse of the gears also is retained. Final drive is by propeller shaft and bevel gear to the divided rear axle, a special bearing in the differential taking up all side thrust and preventing backlash.

The wheel base is 96 inches, the wheels are 32 inches in diameter, and the springs are 36⅛ inches and 45¾ inches in length, front and rear. The rear springs are set well out toward the hubs in order to bring the load as nearly as may be to the point of support. The brakes are of the type employed on the Model D car, the external member being of the "clam-shell" type fibre lined, and hinged at the bottom, while the internal expanding brake is lined with segments of seasoned hickory boiled in oil. The general appearance of the vehicle is neat and stable, thoroughly in accord with the other members of the line, yet sufficiently "racy" to satisfy all who desire a machine coming under that appellation.

Sidelight on Upkeep of Tires.

"Damn it! they've got to pay me," ejaculated the chauffeur who had just been "turned down" in his quest for a commission from a firm of whom he had bought a set of tires. "It was up to me to get those tires anywhere I wanted to and I picked these people out because I thought they'd give up."

"They used to," he continued, as his wrath increased, "and they'll have to again if they want the orders."

"What are you going to do," asked one of his hearers, "if none of them give commissions, you've got to have tires just the same?"

"That's all right," was the reply, "I'll have to have 'em, but," and a grin spread over his features, "but I won't have to buy them so often, for I'll keep out of car tracks and use 'em so carefully that they'll last so long there will be little 'doin'' in the tire business. Oh, they'll give commissions all right, all right, before we get through."

Los Angeles chauffeurs, mechanics and repairmen have organized as the Mahout Club, which starts with a membership of 96, and these officers: President, John Keough; vice-president, Harry Bore; secretary, Sid. Kendall; treasurer, Ray Rogers.

USING THE MOTOR AS A BRAKE

Simple Method Adopted in the Panhard—Device Altering Valve Action to Cause Resistance to Motion.

Generally speaking, the simplest and most satisfactory way to effect the retardation or stoppage of the machine is by means of friction brakes applied in any one of the several ways at present meeting with the approval of the most successful designers. At the same time, it is evident that the growing practice of supplying means of using the motor as a brake is at once logical and for long descents safer and otherwise more suitable than the use of plain friction devices. The real difference in principle between the two systems, is of course, that where in the one case the energy of the moving vehicle is converted into the heat of friction between metallic surfaces, in the other it is converted into the heat of friction between the molecules of air contained in the engine cylinders, and as such, is carried away through the exhaust without imposing any stresses on the machine other than it may be called upon to bear in its normal action.

Several of the Continental makers are now using braking devices of this description, and with considerable success, one of the simplest and most successful, judging by its design, being that applied to the 1908 Panhard cars, and shown for the first time in this country at the recent Importer's Salon in New York. It is to be understood that merely by closing the throttle tightly and permitting the car to drive the engine a certain amount of resistance to motion may be obtained. This, however, will be confined solely to the partial vacuum established during the suction stroke, and while analagous to the one-power-stroke-in-four of the regular action of the machine, is by no means as effective, as the resistance in the case of braking is not very considerable in amount. In several of the systems of motor braking in vogue, the Panhard being among them, the plan is adopted of altering the valve action in such a way as to introduce some measure of resistance to piston motion during three or four successive strokes, instead of one only. In the Panhard system, this is done by throwing an additional cam into action on the exhaust side of the motor when it is desired to use it as a brake, thus converting it into a compressor for the time being.

With this in view, the exhaust cam shaft is made slidable in its bearings, the cams being of the two-step variety, one step being of the normal profile, while the other has three lobes instead of one. When the shaft is thrown over into the braking position, the throttle being closed for the time being, the first down stroke of the piston is made against a partial vacuum. Just at the end of the suction stroke, the lobe, A, raises the valve momentarily, admitting the gases from the exhaust manifold to the cylinder to overcome the vacuum. Thus during the first stroke T1, the resistance developed is measured by the arc B1, of the diagram. The cylinder be-

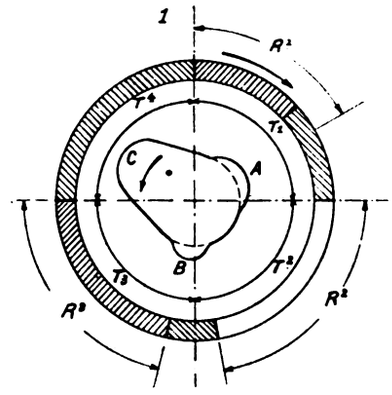

Fig. 1

ing filled with gas at this point, the return of the piston is made against compression, the stroke, T2, having an equal arc of resistance, R2, up to the point of action of the cam, B, which lifts the exhaust valve

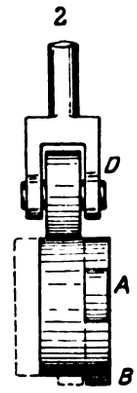

Fig. 2

again for an instant at the end of the stroke, releasing the compressed air.

During the third stroke, when the explosion would ordinarily be taking place, the piston is again moving down against a par-

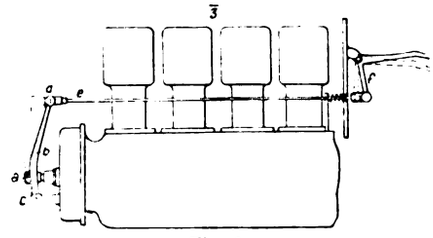

Fig. 3

tial vacuum, the stroke, T3, being completed against the resistance, R3. During the fourth stroke, T4, the regular cam lifts the exhaust valve and permits the cylinder to be entirely freed of its contents. The net effect is thus to produce three strokes out of four during the greater part of which the motion of the piston is resisted. Various tests go to show that under these circumstances the braking effect of the motor is equivalent to about one-half of its power, regardless of its size.

The way in which the braking is effected mechanically is shown plainly in the second and third illustrations. Fig. 2 shows the cam and follower in elevation, the amount of longitudinal displacement necessary to effect the braking being shown by the dotted lines at the left of the figure. Fig. 3 shows the motor in outline, and reveals the outward connections which are under the control of the driver.

A short lever, b, articulated to the end of the crank case at c, is connected by means of a suitable yoke, to the end of the cam shaft at the point, a, the rod, e, taking hold of its upper end, d. A special brake pedal, f, is mounted on the foot board along side the clutch pedal and is normally held up by a spring, against which it must be moved to depress it. Depressing the pedal thus serves to pull the rod, e, forcing the cam shaft along in its bearings until the special cam faces come under the lifter. Proper interconnections are provided to prevent the throttle from being opened while the brake pedal is depressed.

About Air Baths for Varnish.

Many of the best varnishers in the carriage industry insist upon giving their varnishes an air bath prior to applying the material to the surface. When opening a sealed can of varnish they remove the stopper for perhaps twenty-four hours or more, and then prior to individual instances of use thereafter the stopper is removed for a half hour or more before using. It seems to be a well established belief handed down by the top-notch finishers of former days that the inflow of fresh air into the can of varnish is effective in dissipating a certain harmful turpentine gas generated by the tightly enclosed varnish. This gas, during an earlier day, and by not a few well-informed finishers in this day, was and is estimated as the spirit of varnish, possessing sufficient penetrating power, and capacity for nipping into the under coats, to leave the varnish void of its natural brilliancy, and showing a distinct sanded appearance. It is not to be understood that all, or nearly all, varnishes evince this property, but the disposition is quite common enough to arouse interest in the matter, and to suggest this method of relief. At the same time, the air bath treatment can be easily, and often has been, overdone. Varnish, through the evaporation of the turpentine which it contains, if left to protracted exposure to the air, after the first extended air bath, will soon thicken beyond a free and limpid flowing state, which condition unfits it for first-rate varnishing purposes. The happy medium, as stated, consists of an initial air bath of 24 hours, and then following half-hour baths as the varnish is used In case of small shops it is a good plan to buy the varnish in one quart cans.

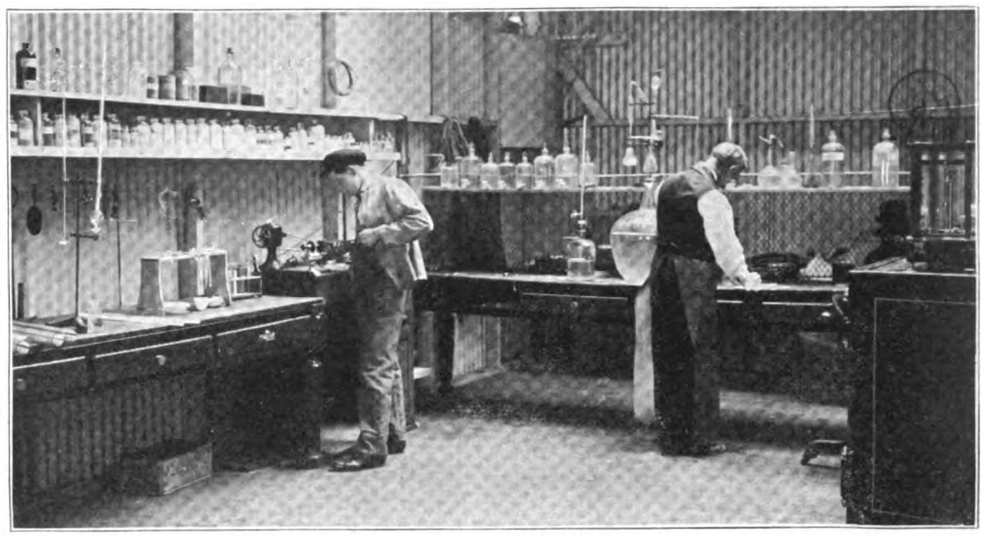
HOW FACTORY TESTS ARE MADE

Unique Apparatus at the Rambler Plant in Kenosha—Its Broad Utility and Compact Arrangement.



Few motorists outside the direct range of factory influence have any conception of the amount of work coming under the inclusive head of testing and experiment, nor of the amount of plant which the up to date maker feels called upon to maintain for this purpose alone. Every factory has its own testing department, to be sure, but the extent to which the most representative ones are equipped for this sort of work is really surprising to one who has not kept in close touch with the development of the industry. Thus in the testing department of Thomas B. Jeffery & Co., at Kenosha, Wis., is an equipment capable of examining the characteristics of every element of the complete car from its crude state up to the point of finishing and finally in regard to its performance in the machine.

The general principles upon which such apparatus must be based, are of necessity much the same in every case. In their applications, however, there is room for considerable originality. In this way the electrical engine dynamometer designed especially for testing the Rambler motors, though similar in a general way to many others already in use exhibits a combination of broad utility and compact arrangement which is altogether unique.

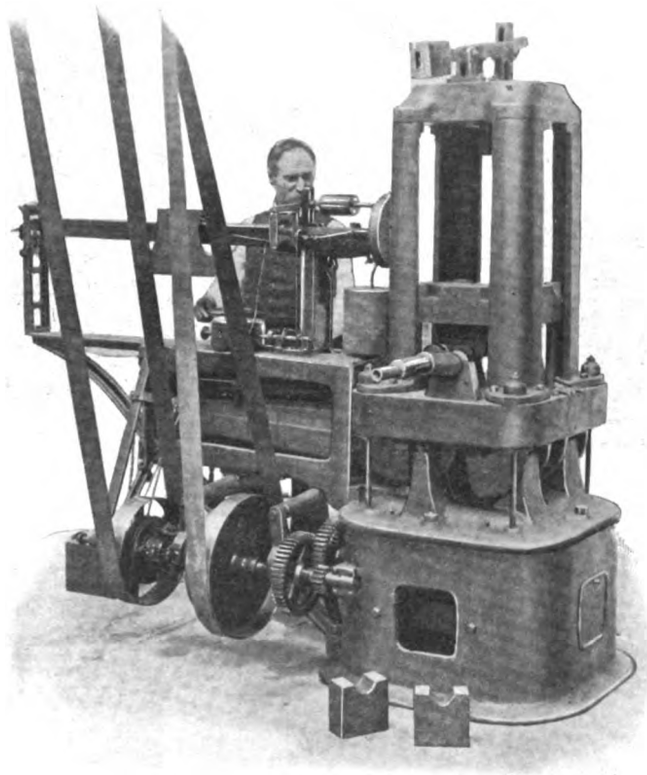
ELECTRICAL DYNAMOMETER FOR TESTING ENGINES

The engine to be tested is placed in a cradle corresponding in form to the chassis of a car, but solidly bedded on the floor, all its connections being made in the same way they would be on the car, even to the carburetter, the electrical connections, and the radiator, which is mounted on a stand in front of the motor. The master clutch connects the crank shaft with a flexible coupling driving a large electric generator which may be used either as a load upon the motor, or in the capacity of an electric motor, to drive it. In either capacity the amount of current passing through the armature coils is accurately measured and affords an exact and immediate indication of the work involved, whether produced by the gas engine itself, or required to turn it over idly. Indications of the first class afford a measure of the developed horsepower of the engine, while those of the second give the self-absorbed power, or engine friction. The sum of the two theoretically gives the indicated power, or work actually developed by the combustion taking place within the cylinders. The singularity of the arrangement consists in the amplifications of these purposes which it is possible to bring about without altering the arrangement of the plant or performing any more complicated operation than throwing a switch or two. A further indication of this is seen in the fact that the rear axle of a car may be substituted for the motor and the friction measured from the ground to the clutch, thus affording means of checking all friction losses in the car.

CORNER IN THE CHEMICAL LABORATORY

The fields of the generator are separately excited, so that all the current passing through the armature is measured directly. All generator losses are standardized and being directly proportional to speed, are applied in the form of corrections to the readings, so that the horsepower produced by the engine under test may be calculated from the volt amperes read from the switchboard. To facilitate rapid observations and reduce the time involved in making a series of test runs, however, a recording watt-meter is employed which is provided with special graduations and which is read in conjunction with a speedometer which is geared to read in miles per hour. Thus the horsepower of the motor in terms of in miles per hour instead of revolutions per minutes may be read off at once. The same observations may be made equally as well when the engine is being driven electrically and the frictional horsepower is required.

For studying the internal action of the motor a manograph is employed, and by means of an arc lamp it is possible to record the manograph cards directly on sensitized paper and without any intermediate processes, thus making permanent record of the tests. Cards so taken may be used in studying the design of the motor in a variety of ways and by making observations with the engine driven electrically, it is possible to obtain very accurate data as to the results obtained with different forms



Digitized by Google

of valve and cam design. As these observations may be made under any sort of circumstances desired, that is to say, with the motor hot or cold, loaded or running light, or with any desired range of carburation and ignition conditions, it is evident that the possibilities offered are practically unlimited.

Mounted near the testing stand is the large marble switch board, upon which are the recording instruments and a series of switches for controlling the current in the armature and fields of the generator as well as for graduating the electrical load. This consists principally of a series of iron grids, in addition to which a large bank of lamps are used. These are controlled by switches in such a way that the load can be graduated with great nicety, all fractions between .1 and 53 horsepower being obtained instantly.

A pair of fuel measuring tanks are located on the back of the board and connected with a gauge glass conveniently located. Either may be used on requirement. One is of such size that its capacity within a stated height is .1 gallon, while the other is 1 gallon. Thus the consumption of the engine may be measured closely within either short or long time limits. Cocks are provided on the face of the board for filling either of the measuring tanks from a supply tank, which also may be made to supply the carburetter directly when the consumption tests are not being made. The gears which drive the speedometer are also used for driving a magneto where one is in use, and also to operate the manograph.

All wiring and other connections from the switchboard to the test stand pass under the raised floor upon which the operator stands to the service piller along side the engine, from which short leads are taken to their final destinations. All the controlling mechanism is thus directly under the eye of the tester, while the complete operation of the plant in whatever way it is used, may be carried on from that standpoint, thus saving time and labor very materially.

MACHINE FOR TESTING MATERIALS AND PARTS

So complete and perfect are all the arrangements that it is possible to make a complete horsepower test of a motor at speeds ranging from 5 to 50 miles an hour within a space of ten minutes. Notwithstanding the great facility with which it may be handled, however, nothing in the arrangements has been designed with a view to sacrificing time to accuracy, and the observations may be made as closely as may be desired.

While the chief interest in the plant must naturally center about the arrangements for testing the completed machine and its components, the chemical and physical departments are equally important as determining the original status of the the materials to be used in the car. Here delicate analyses may be carried out, the properties of any "run" of castings investigated, or new formulae tried out. The picture showing a corner of the chemical laboratory gives a good idea of the apparatus used.

The testing machine shown in the third illustration, is capable of subjecting materials of all sorts to tensil and compressive tests, recording the elastic limits and breaking strengths which are required by the designer in order to determine the proper proportions of parts. More than this, it may be used to test the parts themselves in various ways, recording the highest load which they can carry safely and showing in advance what may rightfully be expected of the finished product once it has passed out of the crysalis stage and begun to undergo the trials of the road.

Why the Varnish Sweats.

It long has been established among carriage painters, hundreds of whom are now enrolled under the banners of the automobile builders, that the main cause of the sweating of varnish is undried, or only partially dried, undercoats of color or of varnish.

An imperfectly dry coat of paint, or of any other material, will retard the drying of the coat of material applied over it, and while these coats may be, apparently, dry with the result that when successive coats of material are placed over them, the condition of the surface under the various layers of material grows gradually worse, so that when the finish is reached, all the elements are present and well developed, for the speedy appearance of the "greasy gloss," otherwise characterized as sweating out. The hurry calls for motor cars during the past year or more have necessitated a system of painting far separated from the best traditions of the craft, affirms a carriage man, and the natural sequence has been, among other untoward surface manifestations, more or less of the sweating out trouble. Given sufficient time for each coat of material, paint or varnish to harden thoroughly and the elimination of the principal cause will have been accomplished. Varying degrees of temperature affect materially the drying of varnish, and, indirectly invite the sweating out disease.

As a matter of safety, varnish should be rubbed and set away for a time, over night if possible, and then rubbed again just prior to applying an additional coat, which treatment will, as a rule, render the surface immune from sweating attacks. Without exception, varnish rubbed and set away for several hours, however hard it may be at the time of rubbing, will accumulate the essence of certain prevailing gases in sufficient quantity to cause sweating of the following coat, should removal of such accumulations by rubbing be neglected.

Electrically propelled fire fighting apparatus has already seen more or less use in Germany and Austria, but up to this time has been but little used in Great Britain. The recent construction of a new "fire escape," or extension ladder for the Liverpool fire brigade, is therefore reckoned a significant innovation. The machine carries an 87-foot ladder, electrically manipulated, and is driven by current from an 80-call battery.

'TWILL BE A FEATHER IN HIS CAP

Unique Trophy for Winner of Savannah's Long Distance Race—Change in Course for Short Contests.

Whoever wins the 360 miles race for stock cars at Savannah, Ga., on March 18th, will be able literally to place a "feather in his cap." The Savannah Automobile Club, which has in hand the promotion of the proposed meet, consisting of three stock chassis races to be held over an 18-mile circuit near the city, on Tuesday and Wednesday, March 17th and 18th, has announced that it will give a silver feather to the winner of the long race.

The idea is novel and will give to the victor a souvenir of the race besides a leg on the Savannah Challenge Trophy. This trophy is different from anything that has ever been offered, according to reports from the Georgia city.

The trophy will be a life size bust, in silver, of the Indian Chief Tomachichi, who was a leader of the Yumacraw Indians, and a personal friend and ally of General Oglethorpe, who founded the city of Savannah. A reproduction in silver of the Indian chief, which stands in a public square in Savannah, will form the base, upon which will rest the bust of the departed Indian, dressed in full war path regalia.

The war bonnet, which will be a string of feathers, will be arranged to allow the insertion of additional feathers. The plan is to have two feathers made each year the race is held. On each will be inscribed the name of the driver, the winning car, time, and other details of the like; one feather will be stuck in the head-dress of the Indian and a duplicate presented to the winner. The trophy itself will virtually be a perpetual affair as it will have to be won three times by a car of the same make before it will become the absolute property of anyone. Until that time it is expected the trophy will remain in the custody of the Savannah Automobile Club.

It is stated that two valuable silver cups will be awarded in the other two evnts. These will be known as the Southern Runabout Cup and the Southern Six-Cylinder Cup, and will become the absolute property of the entrant of the winning car.

Whether the meet will be held is problematical and depends upon how readily cars are entered. As has been stated in the Motor World, the meet will take place if thirty cars are entered before March 1st for the three events. Late reports from Georgia state that the two shorter races which are carded for the first day and over a ten mile course, will be run over the longer course, that measures eighteen miles. It also is announced that a gang of convicts already is at work repairing the roads, and making what improvements will be necessary. The decision to hold the three races over one course will lessen the expense of repairing the roadway somewhat.

No Dewar Trophy Race This Year.

The one mile race for the Dewar trophy will not be held this year; at least not at the Florida meet, according to an announcement sent out this week by the contest committee of the Automobile Club of America. The committee laid down conditions that at this year's meet cars would have to cover at least 100 miles at an average speed of 60 miles an hour in one of the long races in order to qualify for the short races. This was done to eliminate freaks. It is said that both the makers of the Ross and Stanley steam cars, which have each won the trophy, objected very vigorously to this clause. As the trustees of the Dewar trophy upheld Ross and Stanley in their contention, the Automobile Club of America, without wasting any time in argument, struck the event from the program.

The beautiful conception of amateurism permitted by the American Automobile Association has been further enhanced (?) by changing the conditions for the "invitation race for gentleman amateurs" so that any one invited to drive in this contest need not own a car, but may borrow one for the occasion, providing he drives it himself.

Harrisburg's Endurance Run Program.

The Motor Club of Harrisburg, Pa., will hold its annual endurance run from that city to Philadelphia and return on May 5th and 6th, these dates having been selected at the last meeting of the club. The first day's run will be through Lebanon, Reading, Kutztown and Allentown, while the return journey will be through Norristown, Pottstown, Reading and Lancaster, a distance of about 250 miles. Cars will be divided into four classes as follows: Touring cars costing $2,500 and over; touring cars costing less than $2,500; runabouts costing $2,000 and over, and runabouts costing less than $2,000. In addition to the four trophies offered for the run, the four touring cars that were tied in the run last year will attempt to decide permanent ownership of the cup that was not awarded.

To Enforce the Rule on Amateurs.

The registration committee of the Pacific Association of the Amateur Athletic Union has begun the enforcement of the resolution adopted by the national body to the effect that automobilists who compete for cash or against professionals shall not be recognized as amateurs. The Pacific Association has appointed an "automobile commissioner" to "keep tabs" on the offenders and a considerable stir has resulted. As the automobilists on the coast have followed the ridiculous rule of the American Automobile Association, which permits an amateur to compete for money of against anyone he pleases, the action of the A. A. U. branch will prove far reaching.

START FOR NEW YORK-PARIS RACE

Foreign Entrants Depart for America Amid Enthusiasm—Meeting Here of Interested American Automobilists.

There seems little doubt now that the proposed New York-Paris race will start from this city sometime next month. Although the plans of the four American manufacturers that are said to have formally entered cars have been kept very much in the dark the foreign delegation actually have started for New York.

According to cable dispatches the German Prothos car received a great adieu when it left Berlin Sunday morning, bound for Hamburg, where it embarked on the Kaiserin Auguste Victoria yesterday, Wednesday. In spite of the early hour the streets were crowded and scores of military attaches gathered to bid farewell to Lieut. Koeppen, of the 15th Infantry, who will accompany the car as correspondent for a Berlin newspaper. Hans Knape, an experienced race driver, was in charge of the car, and Ernest Maas, the remaining member of the crew, did not accompany it overland to Hamburg, but went to Havre to see if he could obtain any pointers from the French and Italian entrants. The Germans are due to arrive in New York City, Friday, February 7th.

The three French and one Italian entrants received just as enthusiastic a send-off when they left Paris Tuesday morning, 28th inst., en route for Havre, where they will embark on the Lorraine Saturday. The steamship is due in New York February 8th, one day after the German boat.

It is evident that the Itala car will not start, as it was not among the number that left Paris this week. The cars and their drivers were the 40 horsepower De Dion, manned by G. B. Ct. Chaffray, who originally proposed the long distance "race"; 40 horsepower Motobloc, driven by M. Godard, who finished second in the Pekin-Paris event last year; the 12 horsepower Sizaire-Naudin, with M. Pons, also a competitor in the Pekin-Paris, at the wheel, and the 30 horsepower Brixia-Zust, driven by Antonio Scafoglio. The last named is Italian, the other three being French.

A meeting of the representatives of the American manufacturers who are said to have entered cars was held in New York City last Thursday, 23d inst., when phases of the contest, relative to the American end of the affair, were discussed. Percy F. Megargle, who has made three trips across continent; John Riordan, who has been over the trail in Alaska, and Luigi Barzini, who accompanied Prince Scipio Borghese, the winner, in the Pekin-Paris "race," were present and spoke of the regions with which they were most familiar. The Thomas car was represented by Montague Roberts; the

Digitized by Google

Maxwell by W. J. Hanley and Ernest Coler; the White, by W. S. Shearman; the Corbin, by Philip Stillman, and the Reo by a representative of R. M. Owen. The general impression seemed to be that a detour would have to be made at Reno, Nev., on account of the possibilities of snow blocking the passes in the Sierra Nevada mountains. This would take the contestants to Los Angeles instead of to San Francisco, making a distance of about 4,500 miles for the trip across the American continent. It is figured that this part of the journey can be made in from 30 to 40 days, and allow for the shipment of the cars to Valdez, Alaska, so they would reach there by April 1st. Riordan, who knows the Alaska country like a book, having spent thirteen years there, said he would be willing to spend two years in jail if he could not get a car to Nome by May 1st if he left Valdez by April 5th.

From Nome there follows the run to Cape Prince of Wales, and thence across the Bering straits, which apparently is the worst part of the journey. Once across the straits is a 4,000 miles stretch across Siberia to Irkutsk, and then over the trail blazed by the Pekin-Paris contenders. From Valdez to Irkutsk, however, is country over which no automobile has yet passed, so far as is known.

Dayton Dealer Killed by a Train.

Edward Borderwisch, an automobile dealer of Dayton, Ohio, was instantly killed in a grade accident in that city Monday night, 20th inst. Borderwisch had taken Paul F. Moffett, a friend and civil engineer of Springfield, out for a ride about 8.30 p. m. As the automobile neared the dangerous grade crossing at Sixth street, the gates of which were up, Borderwisch slowed down to let a train pass, and then started across the tracks. Another train, following closely upon the other, caught the automobile squarely. Moffett had a miraculous escape, being tossed clear of the tracks, but Borderwisch was ground to pieces under the wheels and the automobile reduced to junk. For several years Borderwisch and E. M. Glancy who, by the way was killed in a railway wreck less than a year ago, had conducted a garage under the name of Borderwisch & Glancy. Following his partner's untimely death Borderwisch conducted the garage alone, but retained the old firm name. He was 31 years of age, and was married only December 5th last.

This Man Wants Continuous Noise.

In curious contrast to the effort made in every direction to suppress the noise produced by motor vehicles, William P. Cherrington, of Massachusetts, asks for a law to compel the use on every automobile or motorcycle of some device "which will give continuous warning of the approach of such vehicle, and will be no more objectionable than sleighbells."

CHANGES IN GRAND PRIX RULES

Regulation Limiting Piston Area Adopted for this Year's Contest—Other Important Requirements Made.

Regulations governing the 1908 Grand Prix have been adopted and issued by the Automobile Club de France, an announcement of which was made through the Automobile Club of America this week. The race is to be a distance of from 700 to 800 kilometres, and will be held within the first two weeks in July, the date and circuit to be fixed later.

Several changes are apparent in this year's rules, most important of which is the limitation of piston area, and restricting each maker to three cars, those having engines made under the same license not being allowed to enter more than three cars altogether.

After considerable wrangling at the Ostend conference a definition was adopted fixing a maximum bore of 155 millimetres for a four cylinder engine, or its equivalent in surface for any other number of cylinders, and a minimum weight of 1,100 kilos without fuel and water, but including oil in the crank case and gear box. This definition results in a maximum of 75,476.8 square millimetres for a four cylinder engine and the equivalent bore for motors of more or less than four cylinders is as follows, without taking into account the decimals: For 1 cylinder, 310 millimetres bore; 2 cylinders, 219 mm.; 3 cylinders, 179 mm.; 6 cylinders, 127 mm.; 8 cylinders, 110mm.

The entrance fees fixed are $1,000 for one car, $1,800 for two cars, and $2,400 for three cars, acceptable until February 1st, after which date double fees will be charged.

Another important clause in the rules is that which forbids the use of anything other than ordinary gasolene; that is to say, the addition of any ingredient which aims at supplying oxygen other than that contained in the atmosphere, will not be countenanced.

All cars must have a reverse and must be fitted with mufflers having a horizontal outlet. All repairs must be made by the driver or mecanicien, and detachable rims may be used, but the changing of wheels is prohibited. A mecanicien may change places with the driver at the end of any lap, but while on the circuit may change only in case of extreme necessity.

The official colors adopted were as follows: Germany, white; America, white and red; England, green; Belgium, yellow; France, blue; Italy, red, and Switzerland, yellow and red.

Automobile Corps for German Army.

Germany is preparing to utilize the automobile for army purposes in a large way. The Budget Commission on the 22d inst. passed favorably on a bill setting aside a fund of nearly $500,000 for the organization of an automobile transport corps. The plan is to place at the disposal of the army during manoeuvres and in time of war, automobiles of the heavy type used for rough traffic by manufacturers, express companies and others having such traffic. In furtherance of the plan it is proposed to pay an annual subsidy to owners of such vehicles.

Proposed Lien Law for Garage Men.

Garage men have a friend in Assemblyman Orson J. Weimart, of Buffalo, who has introduced a bill into the New York legislature to amend the lien law so as to give them liens on automobiles for services in connection with them. The proposed section reads:

"A person keeping a garage or place for the storage, maintenance or repair of motor vehicles, and who in connection therewith stores, maintains, keeps or repairs any motor vehicle at the request or with the consent of the owner, whether such owner be a conditional vendee or a mortgagor remaining in possession or otherwise, has a lien upon such motor vehicle for the sum due for the storing, maintaining, keeping or repairing of such motor vehicle, and may detain such motor vehicle at any time it may be lawfully in his possession until such sum is paid."

Court Calls Automobile a Necessity.

That the automobile is a necessity was the opinion expressed last Thursday afternoon, 23d inst., by Justice Marceau in the Equity Term of the Supreme Court in denying the application of John H. Love, Jr., for an order to force Arthur E. Luscher to remove a garage from his premises at 292 East 17th street, Brooklyn, on the ground that it injures property. According to the terms upon which the property in that section was sold only one building can be erected upon each of the plots of land. The complainants said that Luscher violated the terms upon which he acquired the property, while the latter declared he did not as he had built a one-story extension to his residence, in which to house his car. The Justice thought Luscher had acted within his rights and in denying the application took occasion to say that automobiles are a necessity nowadays.

Brockton Club has Awakening.

At a special meeting of the Brockton (Mass.) Automobile Club held on January 20th, the following officers were elected; President, Elmer Walker; vice-president, Henry R. Burbeck, of North Abington; secretary and treasurer, H. A. Churchill. The terms of the former officers expired with the beginning of the year, but no meeting was held to elect new officers as the old ones were unwilling to become candidates for re-election because of general lack of interest in the club. Now it is purposed to infuse new life into the organization.

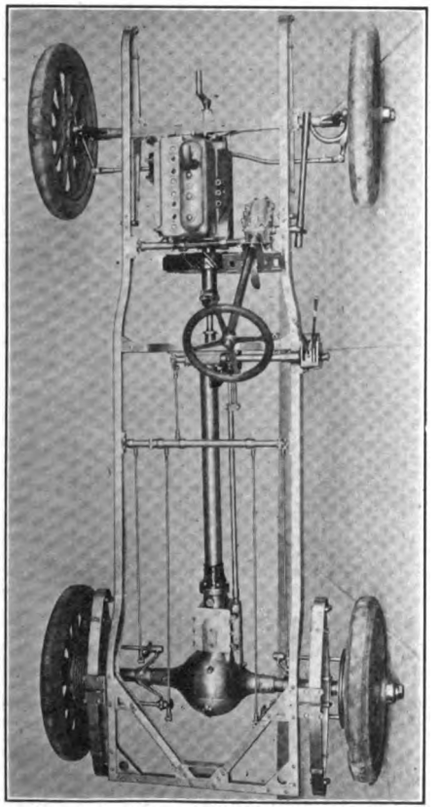
THOMAS TAXICAB CONSTRUCTION

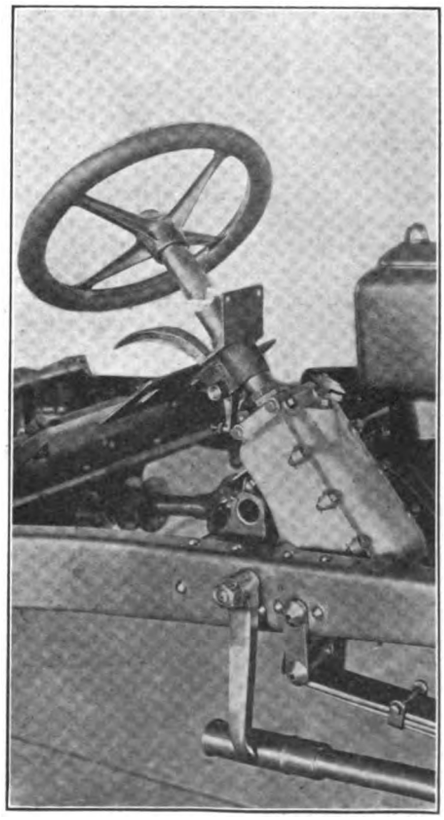
Block Type Motor One of Its Prominent Features—Other Elements Contributing to Economy of Upkeep.

Among the new designs which the recent show season brought to light, probably none attracted a greater amount of favorable comment than did the new Thomas town car and taxicab chassis. While excellently developed as a light and efficient vehicle for city use, and especially so in the hands of the private owner, the recent booking of orders for a large number of these little machines to go into commercitl service in New York and Chicago directs attention to their particularly utilitarian aspects.

The essence of the Thomas taxicab chassis is the block type motor which, as shown in the accompanying picture, consists practically of but two castings, one of iron and the other of bronze. The former contains the four cylinders, together with their valve pockets, water jackets, and also the intake and exhaust manifolds. The second casting serves as the engine base, also carrying one of the two water ports for the thermo-syphon cooling system, the carburetter mixing chamber and the gear housings. The cylinder casting is cored through from the forward end, and from above, leaving an opening at the front and one at the top to be covered with plates. The upper cover also carries the outlet pipe for the cooling system, which leads directly to the radiator. The exhaust manifold, which lies to the outside of the cylinder casting is amply cooled by means of longitudinal flanges running its entire length, while its proximity to the intake port serves to warm the incoming gases sufficiently to aid the effect of compression in producing a quick-firing mixture.



THOMAS BLOCK MOTOR



The base casting is supported on a tubular hanger running across the car just over the crank shaft in the rear and at a single point below the radiator seat in front, making a three-point support of the most approved pattern. The crank shaft is supported on two annular ball bearings, and the two-to-one gears in front are completely housed in the case, as is the additional gear which drives the Bosch high tension magneto—the only means of ignition provided.

The regular type of triple-disc clutch which is a feature of Thomas design is employed in this case, the fly wheel having fan blades cast in its periphery to aid in cooling the motor and providing the only draught which is required for the purpose. Back of the clutch is a single universal joint inside a yoke which carries the combined shaft casing and torque tube. The change gear group is mounted on the bronze housed rear axle and as the accompanying view of the chassis shows, the only external parts are the tube and the gear-striking and brake rods. The latter extend to the double internal brakes. Of these, the emergency set are expended within drums provided outwardly with air-cooling flanges, which serve to keep down the working temperature when long-continued service is demanded of them.

Another feature of the chassis construction which tends to a reduction in repair bills is the method of mounting the steering gear, which is placed above the chassis line and in front of the dash board. In this position it is perfectly accessible at all times, and, as shown in the picture, may be dismounted without removing its housing from the frame, or may be adjusted and cleaned by simply removing the large cover plate which is placed in front. The same attention to detail which characterizes this feature is present throughout the vehicle, which may be repaired or adjusted entirely from above without the necessity of running it over a pit.

AMMETER FOR TESTING THE COIL

Novel Method Suggested for Improvement of the Timing—How Trembler Lag Affects the Spark.

It is only recently that the attention of the motoring public has been called at all closely to the more intimate details of the action of the ignition system. Beginning with the development of the idea that the relative "fatness" of the spark had little to do with the effectiveness of the ignition, it has been shown that there are many matters in connection with the operation of the ordinary jump spark, to say nothing of the magneto systems, which even yet are but little understood. In this connection, a foreign ignition specialist has recently placed on the market an ammeter of special construction which is designed for the specific purpóse of adjusting the coil with regard to economy of action and uniform regulation of the timing.

As is well known, the action of the common vibrator coil is always subject to a greater or less amount of lag representing the very small increment of time between the closing of the primary circuit and the instant when the first induced spark passes the points of the plug. This lag varies with the temperature of the coil and also with the amount of current being sent through it. Furthermore, it is apparent that with even a very slight variation in the adjustment of the several vibrators of a multiple coil a considerable variation in the distribution of the secondary takes place, which must serve to alter the timing of the explosions to a considerable degree.

By way of determining the actual performance of the coil with absolute accuracy, a special device has been employed which consists primarily of a commutator so contrived that the angular length of its contact can be altered. On the same shaft, a high tension finger is located, which travels close to the face of a stationary disc which is graduated into 360 degrees. When the low tension circuit is closed, the high tension spark jumps the gap between the finger and the disc, the point of action being clearly observable. Such an apparatus was used in a series of experiments performed some little time ago, in which the subject of trembler lag was investigated and a number of new points developed. Its use in this connection was to establish certain standard relations between the consumption of the coil and the position of the first spark to pass the gap at the plug, considered with relation to piston position. The following table, taken with an arc of commutator contact 52 degrees in length, shows the amount of variation in timing which may be brought about by differences in trembler adjustment:

Consumption at rest. Amps.	Consumption running Amps.	Revs. of commutator shaft.	Position of first spark.
.75	.6	264	2°
.75	.6	932	12°
.75	.6	2,464	36°
1.0	.7	264	5°
1.0	.7	932	16°
1.0	.7	2,464	43°
1.5	.9	260	8°
1.5	.9	940	23°
1.5	.8	2,464	50°
2.0	1.1	264	12°
2.0	1.8	940	36°
2.0	1.2	2,460	60°

These observations of course apply only to the particular coil under test, and are probably quite different from what would be obtained from similar tests applied to typical American coils, or even to coils of the same make under different conditions of adjustment, and installation in the car. Nevertheless they serve well by way of illustration, and bring out the real point, which is that, variations in current consumption involve variations in the timing of the spark. Regarding the observations in question, the maker says: "Taking for instance a four-cylinder engine with 4-inch stroke (bore of no importance), and a quadruple coil. . . . . let the firing position at the retarded point be at the top of the stroke in the cylinder, and let each trembler be adjusted to .75 amperes (not running) for No. 1 cylinder, and 2 amperes No. 2 cylinder, 1.5 amperes No. 3 cylinder, and 2 amperes No. 4 cylinder, a general adjustment which we might mention in our experience is by no means uncommon: we have often come across quadruple coils running at varying consumptions from 1 to 4 amperes, so that in taking this particular instance we are taking an average. Then we have at, say, full advance (reckoning on a 60 degree full advance) at 932 commutator revolutions of 1,864 engine revolutions, No. 1 cylinder firing 1.15 in. from the top of the stroke, No. 2 cylinder .97 inches, No. 3 .82 inches, and No. 4 cylinder .575 inch, a position of affairs which is not likely to give one the sweetest running, and which is indeed most detrimental to the life of the instrument. More mysterious knocking is caused by this than one would imagine. Again, the use of a meter enables one to gauge to a nicety the proper and safe consumption for any type of coil, once the owner has been informed of the proper consumption which is best for all-round purposes. This consumption, whatever it is, can be checked periodically, especially when any alteration to the adjustment is made in the manner of filing of the platinum points, replacing of screws, blades, or armature, when it becomes difficult to most people to adjust the tremblers to give the best results. The use of an ampere meter will decrease this work very considerably.

"One cannot accurately by the sound of the trembler, nor yet by the appearance of the spark, tell if a section is performing its work properly. A good strong buzz is as likely as not due to the fact that the consumption is high, or, in other words, that the tension of the armature spring or platinum blade is too great. The appearance of the spark also is very deceptive. The length of the spark may remain about the same, but its fatness and heat may be considerably increased, and yet to the unpractised eye appear approximately the same. This will show that a meter is a most necessary factor for determining the coil output.

"One of the dangers of a coil consuming too much current is the general melting of the insulation both contained in the bobbin and surrounding it, resulting in a considerable attenuation of the spark, which from that time forward cannot be rectified. This attenuation is given in the figures as under:—

Continuous consumption 2½ amps.
Starting temperature reading of thermometem 18.6° Cent.

Time.	Temperature of wax	Length of spark.
Zero	18.6°	15 mm.
½ hour	25.2°	14 "
1 "	wax melting.. 32.4°	14 "
1½ "	" " .. 36.2°	14 "
2 "	" " .. 38.3°	14 "
2½ "	" " .. 41.4°	13.5 "
3 "	" melted .. 44.3°	13.5 "
3½ "	" " .. 47.6°	13 "
4 "	" " .. 49.4°	13 "
4½ "	" " .. 50.0°	13 "
5 "	50 C., end of graduation	.12 "
5½ "	" " " " "	...12 "
6 "	" " " " "	...12 "
6½ "	" " " " "	...12 "
7 "	" " " " "	...11.5 "
7½ "	" " " " "	...11.5 "

"This test was carried out by embedding into the insulation of the wax surrounding the bobbin an ordinary Centigrade thermemeter."

While it is evident that to the ordinary user the ammeter may not be of great value as applied directly to the tremblers, still it is likely that by inserting the instrument in the primary circuit with the motor at rest and turning over the commutator from contact to contact, adjusting the tremblers to give the same consumption in each case, a much closer approach to synchronism might be obtained than is possible with the ordinary means of adjustment by eye and ear alone. So far as is known, the idea is entirely novel, and though the difference in consumption between stationary and running conditions is not exactly the same for all speeds, it is nearly so, and with vibrator springs of uniform temper, should vary but little in any given coil.

About Blanketing the Radiator.

It is all well enough to cover the bonnet of the car with a robe or blanket during cold weather, when it is necessary to leave the motor for some little time without withdrawing the water from the cooling system. It should be remembered, however, that the protection against cold also is a protection against the radiation of heat, and care should be taken not to run the motor for more than a moment or two with the bonnet covered in this way as otherwise serious overheating may result.

The Week's Patents.

870,666. Vehicle Brake. De Witt Cookingham, Cleveland, Ohio, assignor of one-half to John H. Hertner, Cleveland, Ohio. Filed June 23, 1906. Serial No. 323,023.

1. In a vehicle brake, a brake frame and brake shoes adapted to frictionally engage said frame, a member on which the said shoes are pivotally supported, means for forcing the shoes into engagement with the brake frame, said shoes being wholly incased, and means accessible from the exterior of the incasing structure adapted to move the shoes toward the brake frame at the pivotal points.

870,794. Steering Mechanism. Harry E. Norris, Arnold, Ohio. Filed Dec. 12, 1906. Serial No. 347,487.

1. In a steering mechanism, the combination with the connecting bar of the wheel axles, of a plate secured to said bar provided with outwardly projecting sleeves, pins mounted in said sleeves carrying anti-friction rollers and a worm wheel carried by the main axle meshing with said rollers for the purpose described.

870,795. Speed Indicator. Ed C. Oliver, Minneapolis, Minn., assignor to Harry E. Pence, Minneapolis, Minn. Filed Nov. 13, 1906. Serial No. 343,238.

1. In a speed indicating device, the combination, with a rotating spindle, of a weight centrally pivoted thereon and having a cam surface, a spring, a lever bearing on said spring and on said car surface, the effective leverage of the spring on the cam varying with the speed of rotation.

870,796. Tire Protector. Russell Parker, New York, N. Y. Filed Nov. 22, 1905. Serial No. 288,545.

1. A tire protector having a free edge with a limiting device to restrict its diameter, the other edge being unrestrained to allow the protector to be slipped over the tire and to be drawn tight at individual points, and a number of holders extending from the other edge of the protector and adapted for connection with the wheel.

871,032. Means to Record the Speed of Automobiles. William A. Cheesebro, Los Angeles, Cal., assignor, by direct and mesne assignment, of one-third to David E. Lyons and one-third to William H. Sheasby, Los Angeles, Cal. Filed Jan. 25, 1906. Serial No. 297,845.

1. The combination with a drum, means for rotating the drum, and means for carrying a record sheet upon the drum, of a drive shaft, a governor on said drive shaft, a grooved support carried by the drive shaft, said support having a longitudinal movement on the shaft, a record marker carrying rod slidingly supported in bearings and having a fork on its inner end which engages the grooved support connected with the governor, a marker supporting bracket mounted on the marker carrying rod, a record marker secured to said bracket, and a spring rigidly secured at one end to the marker carrying rod and coiled around the latter with its free end resting upon the projecting end of the holding bracket.

871,098. Means for Driving Motor Road Vehicles. Martin Albrecht, Friedberg, Germany, assignor to Felten & Guilleaume-Lahmeyerwerke Actien-Gesellschaft, Frankfort-on-the-Main, Germany. Filed Feb. 20, 1907. Serial No. 258,468.

1. In a motor car, the combination of a plurality of independent driving wheels, a prime motor, an electric generator, differential gearing connected with one element of said generator, and with two of the driving wheels, and electric motors adapted to be energized by said generator and arranged to drive others of said wheels.

871,108. Transmission Gear for Motor Lorries and other Vehicles. Adolphe Clement, Levallois-Perret, France. Filed March 16, 1905. Serial No. 250,468.

In a motor vehicle, an axle for the driven wheels, a differential gear mounted outside of the axle, a longitudinal driving shaft connected to the driving pinion of the differential gear by a universal joint and connected to the main shaft by a universal joint and a pair of stays connected to said axle near its ends and converging to the center of the vehicle and connected by a universal joint to the frame of the vehicle.

871,109. Steering Mechanism for Motor Cars. George H. Coates, Worcester, Mass. Filed March 28, 1904. Serial No. 200,264.

1. In a steering mechanism for motor vehicles, the combination with a rotating shaft, of an inclosing case for said shaft consisting of a straight section and a curved section capable of rotating about an axis coincident with the axis of said straight section, a joint between said straight section and said curved section, and means for locking said curved section at any point in its movement about said straight section.

871,134. Carburetter. Joseph G. P. M. Monnier and Antoine M. Morin, Boulogne-sur-Seine, France. Filed March 13, 1906. Serial No. 305,839.

1. In a carburetter, an atomizing chamber having a conical shape at its lower end, and an air inlet at its bottom, a nozzle extending through the lower conical portion, and an inverted hollow apertured mixing cone having an open lower end situated over the nozzle, said atomizing chamber having auxiliary air inlet ports in its side opposite said mixing cone.

871,159. Tire. Winthrop D. Baker, Brockton, Mass. Filed July 16, 1906. Serial No. 326,421.

1. A resilient tire constructed in ring-like sections, each of which is provided with a base enlargement producing retaining lugs adapted for reception in the rim of a wheel, a rubber core threaded through said sections, tie wires also threaded through said sections and adapted to secure said sections together, a wheel rim constructed in sections mounted to slide transversely with relation to each other and adapted to grip the retaining lugs of the tire sections, and bolts extending transversely from one section of the rim to the other and through the base enlargement of the tire sections, whereby to bind the two sections of the rim together and to assist in holding the tire sections in the rim.

871,169. Pneumatic Tire. Frederic C. Hood, Boston, Mass. Filed June 11, 1906. Serial No. 321,229.

In combination, a rim having a substantially flat surface and a permanent retaining flange on one side, a removable flange on the opposite side, inwardly extending projections having inclined faces at the junctions of the flanges and rim, said projections serving to brace said flanges, bolts passing across the face of the rim and through said projections and connecting the permanent and removable flanges, and a resilient tire seated on said rim and confined between said flanges, said tire having transverse grooves to receive the bolts and corner recesses to receive the lugs, substantially as described.

871,786. Pneumatic Equalizer for Vehicles. Chaim Rosenzweig, New York, N. Y. Filed April 28, 1906. Serial No. 314,117.

1. In a vehicle having a steering portion, the combination of two members arranged one above the other, hollow cushions interposed between said members at each side of the carriage, and means controlled by the movement of the steering portion of the vehicle for admitting fluid to the cushions on one side of the carriage or the other whereby such side may be raised relatively to the other side.

871,233. Changeable Speed Gearing. Albert L. Muren, Belleville, Ill. Filed Oct. 25, 1906. Serial No. 340,541.

1. In a changeable speed gearing, the combination of a driven shaft, a longitudinally shiftable clutch member having an internal gear and a sleeve whereby it is mounted on said shaft and having driving connection therewith, a plurality of sleeved gear members, either of which is adapted to co-operate with the internal gear of said shiftable clutch member, and means for driving said gear members singly, substantially as set forth.

871,237. Shock Absorber for Vehicles. Duncan Robinson, Brookline, Mass. Filed Dec. 12, 1906. Serial No. 347,458.

1. In a shock absorber for vehicles, the combination of a circularly movable spring controlled ring connected with the running gear, a pair of volute springs attached thereto at opposite sides of its center, and means connecting the outer ends of said springs with the vehicle body, substantially as described.

871,297. Vehicle Wheel. Nicholas Schenk, St. Louis, Mo. Filed June 29, 1906. Serial No. 324,066.

1. A vehicle wheel comprising a hub, a rim, inflated tubes located between the hub and the rim and roller bearings between the tubes, substantially as specified.

871,320. Carburetter. Leon Bollee, Le Mans, France. Filed Aug. 3, 1903. Serial No. 168,007.

1. A vaporizer for liquid hydrocarbons, comprising a number of hydrocarbon inlets, a separate air inlet to each hydrocarbon inlet, a common outlet pipe and means for cutting off one or more of the pairs of hydrocarbon inlets and air inlets simultaneously as described.

871,329. Shock Absorber for Motor Cars. Arthur Dutrieux, Le Quesnoy, France. Filed July 16, 1906. Serial No. 326,471.

1. In combination with the supporting spring and body of a vehicle, a sector shaped chamber on said body, a swinging pallet in said chamber having a number of passages therein, a yielding plate secured to said pallet near its center of movement and provided with holes opposite some of said passages but closed opposite others, and means connecting said spring to said pallet whereby the latter is caused to swing in correspondence with the bending of the former, substantially as described.

871,351. Resilient Vehicle Wheel. Chas. J. Malings, Elyria, Ohio. Filed July 30. 1906. Serial No. 328,302.

1. A resilient vehicle wheel, consisting of a hub and rim portion provided with a series of guide lugs, and a series of telescoping spring-resisted spokes pivotally mounted and secured within said guide bars.

871,404. Tire. William A. Heller, Akron.

Digitized by Google

Ohio. Filed Feb. 9, 1907. Serial No. 356,587.

1. The combination with a wheel of a pneumatic tube arranged on the rim thereof and a casing arranged to inclose said pneumatic tube, said casing comprising a bottom or tread portion, a side portion formed integral therewith, a side portion detachably secured to said tread portion and consisting of a number of independent plates, ears formed on said detachable plates and on the integral side plate, lugs formed on the rim of said wheel and pins passing through said ears and between said lugs, substantially as described and for the purpose set forth.

871,460. Rim for Vehicle Wheels. Ernest D. Valentine, Akron, Ohio. Filed Aug. 17, 1906. Serial No. 331,048.

A separable rim for vehicle tires comprising as one of its elements an annular band of suitable width, provided along one side with tire engaging means and further provided with a relatively wide shallow rabbet in its outer surface, a plurality of pins positioned within said rabbet and extending outwardly therefrom a distance not exceeding the depth of said rabbet, a second element arranged to co-operate with said first element to constitute in connection therewith a tire retaining rim consisting of an annular band having a tire engaging means along one side with a rabbet cut in its under face corresponding in contour and size to the rabbet in said first element and adaptedto fit therein, said second element being further provided with a plurality of slots formed in the rabbeted portion thereof, said slots being partially obliquely and partially circumferentially formed and so positioned as to receive the pins on said first element and form a detachable interlocking engagement therewith, and a threaded pin arranged to engage in a threaded opening in said first element, said pin being provided with a projecting end arranged to enter an opening appropriately positioned in said second element whereby said elements are secured against unintentional dislodgment.

871,464. Carburetter. Carl C. Walter, Philadelphia, Pa. Filed Sept. 7, 1905. Serial No. 277,373.

1. A carburetter provided with a fluid fuel feeding piston and its cylinder, an air valve having a stem provided with a retarding piston, a cylinder co-operating with the end of the valve stem and having connections to the first mentioned cylinder, a cylinder co-operating with the retarding piston, and means for creating variable pressure in the last mentioned cylinder, substantially as described.

871,481. Vehicle Wheel. Richard F. Corwin. Grand Rapids, Mich. Filed Oct. 22, 1906. Serial No. 340,103.

1. In a vehicle wheel, a metallic casing open at the inner periphery and having flanges projecting inward and small bolts passing through them, a felly between said flanges and having large holes therethrough to receive the small bolts, a pneumatic tube within the inclosure formed by the felly and the metallic casing, and an intermediate fabric casing woven of elastic warp and non-elastic woof and placed around the pneumatic tube within the metallic casing.

871,506. Resilient Tire. Isaac W. Hodgson, Minneapolis, Minn., assignor of one-half to Edgar J. Hodgson, Minneapolis, Minn., and one-fourth to Philip W. Herzog, St. Paul, Minn. Filed Oct. 12, 1906 Serial No. 338,652.

1. A resilient tire comprising an inner rim, a plurality of tread sections, links arranged in a plane approximately parallel to the plane of the connected tread sections and yieldingly connecting the tread sections in an endless series around said rim with freedom for movements in the plane of the wheel and transversely thereof, and a multiplicity of coiled springs compressed between the said rim and tread sections and exerting outward pressure thereon, substantially as described.

871,515. Vehicle Wheel. William C. Mullen, Pomona, Cal., assignor of one-half to John A. Henjum, Pomona, Cal. Filed June 19, 1906. Serial No. 322,471.

1. The new or improved vehicle wheel consisting of a hub, spokes, felly and inner tire, said tire having radial tubes screwed into and firmly held herein, an outer metallic tire whereinto radial and inwardly projecting pins are fastened, part of each of which pins pass through each of the said tubes, and the outer part of which pins pass through soft india rubber pads situated between the inner and outer metallic tires, the inner end of each pin being provided with screw nuts for securely fastening the outer tire, the inner tire, the felly, and pads together, the outer tire having a casing of soft vulcanized india rubber incasing it on the tread and at the edges, and held in place by tension wires passing circularly through the soft india rubber casing, substantially as hereinbefore described.

871,575. Tire Protector. William T. Dorgan, Peoria, Ill., assignor to William J.

The Miller Speedmeter

The Miller Speedmeter is the simplest and most compact, durable and accurate speedmeter on the market. It works on the principle of centrifugal force. The entire governor mechanism is constructed from tool steel. It is arranged for adjusting the tension of springs at all speeds, and with this special constructed governor and spring adjustment, the springs are made and adjusted to show all speeds with absolute accuracy.

Rate of Speed—We wish to call particular attention to the fact that the Miller Speedmeter will register correctly at a low rate of speed, and the hand does not bob around or fluctuate when running at slow speed.

Flexible Shaft—The flexible shaft used in this instrument is made from tool steel and each link hardened separately before assembling. The cost of this shaft is more than four times that of the wire shafts generally used.

Driving Gears—The Miller Speedmeter is fitted with crown gears with an universal attachment, which permits of the instruments being attached to any style of car on the market.

Distance Traveled—The Miller Speedmeter is fitted with an odometer, which registers the distance traveled in miles. and has total and trip dials.

Finish—The material, workmanship and finish of the Miller Speedmeter is not excelled, if equalled, by any other speed indicator on the market. Each instrument is carefully tested on a special constructed testing machine before leaving the factory, and

Is Guaranteed for One Year.—The price of the Miller Speedmeter complete, including odometer, with dial registering 60 miles per hour, $50.00.

AGENTS WANTED EVERYWHERE—We give a large discount to manufacturers, jobbers, agents and dealers in automobile supplies.

Manufactured by the MILLER SPEEDMETER CO. (Incorporated), 15 Herman Street, Worcester, Mass.

Wiskes and Arthur D. Eddy, Saginaw, Mich Filed Feb. 11, 1907. Serial No. 356,841.

1. A tire protector comprising a sheath of suitable material, approximately semi-circular in cross section, the edges of said sheath being formed with a bead of elongated cross section, said bead being curved on its inner surface and adapted to grip the tire with the edge of the bead.

871,632. Internal Combustion Engine. Arthur Rollason, Long Eaton, England. Filed May 2, 1907. Serial No. 371,520.

1. In a six-stroke cycle internal combustion engine having an additional scavenging valve, a combustion chamber or clearance space having part thereof placed towards one side of the cylinder out of line with the piston and inlet valve, substantially as described.

871,636. Means for Cooling Heated Surfaces. James H. Sager, Rochester, N. Y. Filed Jan. 19, 1905. Serial No. 241,906.

1. In a cooling device the combination with the body to be cooled, of ringlike flanges, encircling said body and attached thereto, at intervals, each of said flanges having one or more perforations that register with those in the adjacent flanges, and also having tubes around said perforations in an adjustment flange.

871,678. Steering Gear. David M. Dearing, Jackson, Mich., assignor of one-half to Louis F. Boos, Jackson, Mich. Filed Feb. 19, 1906. Serial No. 301,892. Renewed April 1, 1907. Serial No. 365,858.

1. A steering gear for vehicles comprising a frame having a reach bar thereon, a front steering axle, a pivoting and cushioning device for said axle upon the front of said reach bar, a guide, and a semi-circular bar engaged with said guide and having its ends connected to said axle at equi-distant points from its pivot.

871,741. Double Carburetter for Explosive Engines. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine. Filed March 14, 1907. Serial No. 362,313.

1. The combination with a plurality of carburetters or vaporizers, of a union having an outlet and provided with a chamber and with separate passages leading from said carburetters to the chamber of said union, and a valve in the said chamber of said union, said valve having separate passages therethrough and being adapted to be moved to different positions to cause the outlet passage from the chamber of said union to be placed in communication with either or both of the said passages from the carburetters.

871,753. Variable Speed Driving Mechanism. Nils Christenson, Lynn, Mass., assignor to Calvin B. Tuttle, Lynn, Mass.; Anna M. Tuttle and Helen M. Marsh administratrices of said Calvin B. Tuttle, deceased. Filed Feb. 25, 1904. Serial No. 195,156.

1. The combination with a driving and driven member, of a friction clutch, the clutch comprising non-fluid members, carried by the driving and driven members respectively, and means actuated by the driving member and at a speed lower than the speed of the driving member and means to operate said first means for causing a frictional engagement of the non-fluid clutch members.

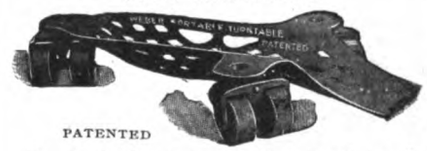
871,775. Muffler. Frederick C. Blanchard and Ernest B. Crocker, Bridgeport, Conn., assignors to The Consolidated Safety Valve Company, a Corporation of Connecticut. Filed July 22, 1907. Serial No. 384,898.

1. In a muffler, a shell provided with an inlet and an outlet and a muffling element, inclosed in and substantially filling the shell, consisting of layers of apertured sheet metal laid parallel to the course of gases passing from the inlet to the outlet and formed with shelves standing out at an angle from the layers of sheet metal.

871,792. Turbine Engine. William J. Francke, Bridgeport, Conn. Filed March 5, 1907. Serial No. 360,664.

1. In an elastic fluid turbine, a casing having inlets and an exhaust, a wheel carrying peripheral buckets, and return buckets of U-shape adjustably secured to the casing sides and disposed to have one end lie adjacent said first named buckets.

871,811. Pneumatic Cushion. William C. McCullough, Bucyrus, Ohio. Filed July 13, 1906. Serial No. 326,129.



In combination with a vehicle axle and a body supporting spring, the herein described cushioning device comprising the pair of holders, each having an integral projection on its outer side, at its center, formed with an attaching flange, one of said attaching flanges secured on the axle and the other secured to the center of the under side of the spring, one of said holders having end guide lugs provided with guide openings, and the other having projections operating in said guide openings, and a cushioning body between the said holders.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

THE MARMON

"A Mechanical Masterpiece"

The Easiest Riding Car in the World

The woman who once experiences the delightful ease of motion, the immunity from exhaustion, found only in the Marmon Car, will not easily be satisfied with anything else.

The motorist who is impressed, as he should be, with marked mechanical excellence, will find in the Marmon a score of other potent reasons—and they are reasons not to be found in any other car, foreign or domestic.

Investigate it, test it on the road before buying any motor car. Wisdom demands this much, at least.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

Warner Instrument Co.
108 Wheeler Ave., Beloit, Wis.

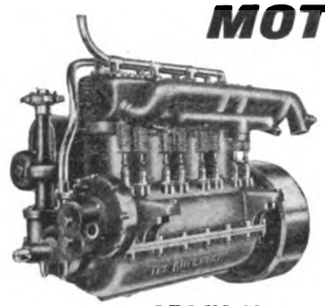
The Largest Automobile Supply House in America

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches, leaves the automobile with its original new lustre, without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish, from the clearest white to the darkest black.

Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all automobile dealers. Price, 60 cents per bottle.



Catalog, largest of the kind, mailed on request.

The Heavier the Load the Greater the Saving

The first cost of TIMKEN equipment for Commercial Vehicles is out of all proportion to the resultant saving in up keep and increased earning power through added carrying capacity.

2-INCH I BEAM AXLE, TIMKEN ROLLER BEARINGS AND HUBS

illustrated above, is especially designed for vehicles doing heavy duty. This Axle is fitted with TIMKEN ROLLER BEARINGS in the knuckle head, making steering, even under the full load carrying capacity, easy and simple—is forged out of heat treated steel and equipped with TIMKEN ROLLER BEARINGS in the hubs.

TIMKEN ROLLER BEARINGS are especially designed to carry as much end thrust as radial load—both principle and construction providing for an evenness of wear that does not impair or destroy in any manner the characteristics of the bearings. This is the TIMKEN principle distinctive and individual—and cannot be found in any other type or form of anti-friction bearings.

And that is the reason WHY the Successful Commercial Vehicle Builders use them.

Facts and figures on reduced cost of operating and maintenance for the asking.

The Car of Steady Service

as applied to the

Rambler

is more than a mere phrase, it is a title earned through correct design and careful construction and proven by years of hard, constant service wherever power-driven vehicles are known.

The practical qualities that established the Rambler reputation are,—

1st—APPLIED POWER. By this we mean actual tractive force as applied to the road wheels. Owing to the straight line drive of the four-cylinder models and the direct chain drive in the two-cylinder cars, Ramblers have greater propelling force per pound than any other car on the market.

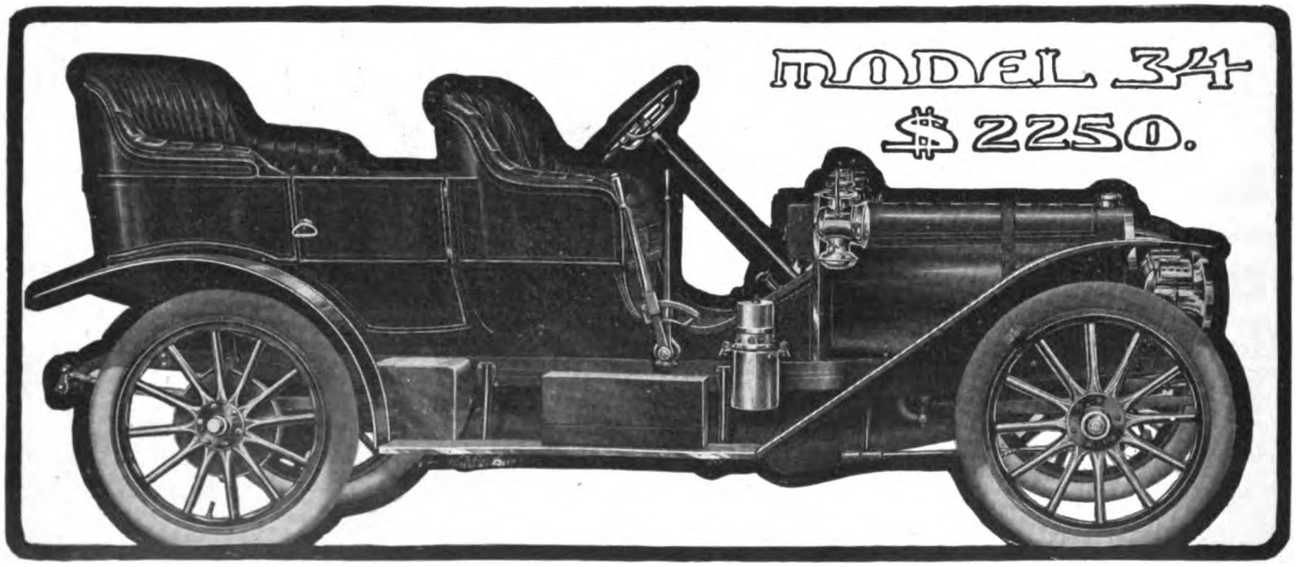
2d—DEPENDABILITY. Ramblers are built to stand the test of hard, daily service over the worst of American roads. This condition is not reached by mere weight and masses of metal, but by simple, scientific construction in which each element is stronger than the strains upon it can ever require.

3d—PRACTICAL ROAD VALUE. With the vast facilities of an enormous plant like the Rambler factory, skillfully directed to the production of two models only, greater value per dollar can be offered than is possible in a plant of lesser output.

In short, the Rambler is a car of

Power, Service and Value

Ordinary business policy dictates a careful examination of its many high qualities before ordering your new car.



Our 1908 catalog fully describing two touring cars and a high-powered roadster is at your service: write to-day.

GOODHUE KNOX'S NEW PRESIDENT

Creditor-Stockholders Choose Chicopee Banker to Succeed Cutler—Reorganization is Now Complete.

The reorganization of the Knox Automobile Co., Springfield, Mass., finally was completed on Saturday last, 1st inst., when the officers selected by the committee previously appointed by the preferred stockholders—all of whom are creditors who accepted stock in payment of their claims—were formally elected by the new directors of the company. They are as follows:

President, Charles L. Goodhue; vice president, William E. Wright; secretary, Charles H. Beckwith; treasurer, Charles L. Goodhue; assistant treasurer, Albert E. Smith.

The directors, who previously had been chosen at a meeting of the stockholders, are as follows: Alfred N. Mayo, Charles L. Goodhue, Charles H. Beckwith, Peter Murray and Clarence E. Whitney, representing the creditors, and William E. Wright, W. H. Chase, M. J. Greenwood and H. W. Cutler, who represent the common shareholders who constituted the old company.

Charles L. Goodhue, the new president and treasurer, is a retired banker, who is a director of the Chicopee National Bank. It is known that E. H. Cutler, the former head of the company, earnestly desired re-election, but he was unable to muster sufficient support and so passes out of the concern's affairs. Messrs. Wright and Smith are the only representatives of the Cutler regime who were retained.

The Knox Automobile Co. assigned on July 22, 1907, with $975,000 assets, and $531,000 liabilities, and since that date has been in the hands of Alfred N. Mayo, the assignee. On December 1, the assignee issued $500,000 preferred stock, which was accepted by the creditors in full satisfaction of their claims. The preferred stock controls the assets and income of the company.

The reorganization of the concern was effected chiefly through the tact and ability of Assignee Mayo, who is treasurer of the Fisk Rubber Co.

Receivers for Coleman's Battery Company.

As a result of a petition in a suit in equity brought by Emma Coleman of Somerset, Va., George F. Keating and Edward R. O'Malley were, on Monday last, 3d inst., appointed receivers of the National Battery Co., of Buffalo, N. Y. The liabilities of the company amount to about $120,000. The assets are estimated at $425,000. The National Battery Co. was one of the relics of the long-defunct American Bicycle Co., or "bicycle trust," as it was better known, of which R. Lindsay Coleman, of New York City and Somerset, Va., was once president. When the trust went to smash, Coleman obtained possession of the Buffalo battery concern, of which he became president. He occupied that office until comparatively recently, when the title of chairman of the board of directors was created for him.

Bonebrake Plans Factory in Kansas.

The Bonebrake Hardware Co., which operates a string of stores in Oklahoma, with headquarters in El Reno, is planning to enter the automobile industry as a manufacturer. The first that was known of the matter was when Mr. Bonebrake entered into negotiations with the Chamber of Commerce of Wichita, Kan., with a view of obtaining a factory site in that city. The project does not appear to have advanced beyond that stage.

Cameron Buys Plant at Beverley.

The Cameron Motor Car Co., of Brockton, Mass., have purchased the brick factory of the Beverley Mfg. Co., Beverley, Mass., and is preparing to take possession at once. An output of 500 cars is in view for the 1908 season.

TRYING TO REVIVE THE TRIDENT

Undeterred by Personal Judgment, President Freeman strives to Secure Capital—Alluring Offer to Investors.

In the New York Supreme Court the Niagara Rubber Co., Lockport, N. Y., was last week awarded judgment for $7,500 against Albert Freeman, president of the Trident Tire Co., New York, who had bound himself personally to secure the contract entered into by the two concerns. It appears the Niagara company was engaged by the Trident people to make their tires, the New York concern agreeing to pay for the material, and also to pay 15 per cent. for the use of the machinery, the full amount of the labor and 25 per cent. profit to the makers.

The Trident company started with a splurge, but made no headway, and judgments have been piling up against it. Meanwhile, Albert Freeman, its president, is circularizing investors in an effort to obtain money to revive the company. His circulars set forth that he is interested in a "pneumatic tire which will revolutionize the tire industry," investment in which will be "not only guaranteed by a 6 per cent. first moragage gold bond, but that the stock, that you will receive as a bonus with the bond, will yield you an additional income of at least from 30 to 40 per cent. per annum."

Dry Cell Makers Decide to Quit.

The Ampere Manufacturing Co., makers of dry batteries, at 408 West Thirteenth street, New York, has applied, through its directors, Leopold Polock, president, and Nathan Friedman, treasurer, to the Supreme Court for a voluntary dissolution of the corporation, which was incorporated March 28, 1907, with a capital stock of $5,000. To wind up its affairs Marcel Levy has been appointed receiver, with a bond of $2,000. The liabilities are $1,727 and assets $1,283.

Digitized by Google

THE WEEK'S INCORPORATIONS.

Boston, Mass.—Crown Motor Vehicle Co., under Massachusetts laws, with $50,000 capital. Corporators—W. A. Shafer and F. Dodge.

Wilmington, Del.—Motor Omnibus Co., The, under Delaware laws, with $45,000 capital. Corporators—H. L. Rice, E. S. Hellings, W. M. Pyle, Wilmington.

Chicago, Ill.—Parsons, Curtis & Co., under Illinois laws, with $10,000 capital; to deal in automobiles. Corporators—C. H. Parsons, A. W. Curtis, and F. A. Bean.

Boston, Mass.—Graham's Automobile Spring & Appliance Co., under Massachusetts laws, with $50,000 capital. Corporators—J. A. Watson, president; J. A. Watson, treasurer.

Auburn, Ind.—McDowell Motor Vehicle Mfg. Co., under Indiana laws, with $20,000 capital; to manufacture automobiles. Corporators—Willis McDowell, Wheeler McDowell, and A. W. McDowell.

New York City, N. Y.—P. & H. Tire Co., under New York laws, with $20,000 capital. Corporators—Roger G. Howell and Edward Tabor, 1657 Broadway; Paul M. Pelletreau, 3 Broad street, New York City.

New York City, N. Y.—General Taximeter Co., under New York laws, with $5,000 capital. Corporators—Alfred Ely, 37 Madison avenue; James T. Riddle, 246 Manhattan avenue; Robert S. Kearney, 31 Nassau street, New York City.

Hutchinson, Kan.—Taylor Motor Co., under Kansas laws, with $10,000 capital; to maintain garage and deal in automobiles. Corporators—Dr. H. G. Welsh, T. J. Templar, L. A. Bunker, H. H. Taylor, and W. Y. Morgan.

New York City, N. Y.—Comet Motor Trucking Co., under New York laws, with $150,000 capital. Corporators—Leslie B. Sanders, 165 West Eighty-second street; Arthur W. Harrell, 503 West 148th street; Otto Bluhm, 23 Liberty street, New York City.

New York City, N.Y.—Wyatt & Listman, under New York laws, with $4,000 capital; to make automobile parts. Corporators—James M. Wyatt, Hotel Gregorian; John B. Haskin, 34 West Eighty-sixth street; Herbert E. Listman, North Arlington avenue, East Orange, N. J.

New York City, N. Y.—Marko Storage Battery Co., under New York laws, with $5,000 capital; to make storage batteries. Corporators—Paul M. Marko, 1231 Bedford avenu; Herman Matfield, 207 Troy avenue, Brooklyn; Charles Standt, 517 Angelique street, West Hoboken, N. J.

Woman Starts Cut Rate Repairing.

Enter the cut-rate repair lady! According to advices from Trenton, N. J., she is Mrs. Clark Fisher, widow of a wealthy anvil maker, who attracted attention two years ago by assuming control of her deceased husband's large business and increasing it to almost double its former volume through her personal efforts. Her latest departure has caused Trenton garage owners to prick up their ears by the announcement that she will devote a portion of her immense plant to the repairing of automobiles at cut prices.

Mrs. Fisher declares that she has been prompted to do this because of the exorbitant prices she has been obliged to pay, both in this country and abroad, for the slightest repairs to her car. She believes that the garage owners "have combined and are practising extortion on the automobilists."

It is this fact, she states, and also a feeling of philanthropy that has caused her to start a movement against high garage charges in Trenton, at any rate. The anvil business, having recently become slack, Mrs. Fisher was troubled about some of her employes, a few of whom have not missed work at the works for 67 years, when the plant was started. So, instead of being compelled to lay them off for a period Mrs. Fisher decided to start in the cut-rate business and keep them busy during the winter. As the plant has an abundance of machinery she is well able to begin operations at once.

The machine shop will undergo a few changes to prepare for the automobile work it is expected to receive. Harold Fisher Brooks, late of the Standard Motor Construction Co., of Jersey City, has been engaged as the head of the automobile repairing department. Trenton's garage owners have not yet been heard from, as to whether they will meet Mrs. Fisher's reductions.

Standard Sizes Adopted for Tubing.

While it was known several months ago that the mechanical branch of the Association of Licensed Automobile Manufacturers had taken up the subject of the standardization of tubing used in automobiles, the results of the endeavor was only this week made public.

The object of the research was to secure a high quality of steel with a maximum of strength and to reduce the number of sizes as much as possible so that deliveries could be more quickly made by the tube manufacturers, who have been required to supply about 1,200 sizes of steel tubes of varying diameters and thicknesses.

As the outcome of the conferences held by the leading experts of the various interests concerned, the number of sizes has been reduced to about 300. Charts have been made of these standard sizes and furnished to the draughting room of each member of the association, giving a schedule of the standard stock sizes of all steel tubing made.

The benefits to be derived from this standardization are obvious: the reduction in weight in a car, the uniformity of sizes used by the various makers, the placing on the open market of certain standard sizes for all cars and the possibility of making quick deliveries to the manufacturers, thus reducing the cost of construction.

IN THE RETAIL WORLD.

The St. Nicholas Avenue Garage, New York City, has increased its capital stock from $10,000 to $50,000.

The Miller Motor Car Co., which has conducted a garage at Seventh and Wisconsin streets, Racine, Wis., is preparing to enlarge. To this end a commodious one-story concrete garage will be erected on Main street.

Fire of unknown origin gutted the Lowell Automobile Co.'s garage at Appleton street and Post Office avenue, Lowell, Mass., Monday night, 27th ult. Several cars were destroyed and others damaged. The total loss will not exceed $25,000, that to the building amounting to about $5,000.

W. A. Richwine has withdrawn from the Hiland Automobile Co., Pittsburg, of which he has been manager since its formation, and with A. H. Sarven will form the Diamond Automobile Co. The new company will be established in East Liberty, Pittsburg, where Buick cars will be handled.

A garage will be opened at 23 Sherman street, Hutchinson, Kan., by the Taylor Motor Co., which has just been incorporated. Besides conducting a general garage business the company will handle accessories and Ford cars. Dr. H. G. Welsh is named as president and H. H. Taylor secretary and manager.

Fire in the two-story frame building at 110-114 Exchange street, Providence, R. I., January 28th, caused a loss of $20,000, several automobile firms sustaining losses. The Flint Motor Car Co. lost several cars, and machinery valued at $16,000. The Autocar repair shop was damaged to the extent of $500. Among the other losers were Adams Brothers, who conducted a machine shop and J. M. Baker, a pattern maker.

More Facilities for Spring Manufacture.

Having passed through the period of financial depression without reducing their force or number of working hours, the Cleveland-Canton Spring Co., who have made extensive investigations of the merits of vanadium steel for automobile springs, have added another building to their plant at Canton, O., for the sole purpose of handling their increasing volume of orders. In the new building springs made from this material and other high grades of spring steel will be heat-treated in furnaces fitted with pyrometers especially designed for this work, securing a uniform tempering of all springs. There also will be a new testing machine installed. Incidentally, improvements have been made in the fitting of springs by the employment of a patented rolling machine which is to be used exclusively by this company.

Regal to Make Taxicabs, Too.

The Regal Automobile Co., Detroit's newest acquisition, will include taxicabs in its productions. The company has acquired a location at Beaubein and Twombly streets.

GROWTH OF AMERICAN EXPORTS

Increase of $1,347,786 for the Year 1907—Gains in Every Geographical Division Except Mexico and Africa.

During the twelve months of the year 1907, America's export trade in automobiles increased exactly $1,347,786. The statistics, which just have become available, show that the total business amounted to $5,756,972, as against $4,409,186, and $2,695,655 for 1906 and 1905, respectively. The number of complete cars exported was 2.894, valued at $5,120,963, leaving $636,000 in round numbers, representing the valuation of parts.

This upward trend has been distinguishable throughout nearly the entire world. Only two individual exceptions—those of Mexico and Africa — being observed. The falling off from 1906 in the first instance amounted to $88,700 in round numbers, while African trading dropped only $7,906 last year. On the other hand, the United Kingdom has shown its appreciation of the American product by purchasing over $600,000 worth more of automobile products in the year just closed than during the year before. British North America comes second, with a growth of $288,500, nearly, and France next in order.

During the closing month, December, 173 cars, valued at $259,341, were exported, the total exports, including parts valuation amounting to $301,432. The returns for December, 1906, amounted to $242,154, the closing month of 1907 thus showing an increase in business of almost $60,000. Eight of the divisions recognized by the Bureau of Statistics at Washington, revealed gains, the United Kingdom leading with an appreciation of $40,000, or thereabouts, while the West Indies and Bermuda jumped up no less than $33,000. Of the six divisions showing losses, France led with $22,200.. The report in detail follows:

Carnival Fund Passes $6,000 Mark.

At a meeting of the New York Automobile Trade Association yesterday, it was made known that the fund for the trade carnival which is scheduled to occur during the week of April 6th, had passed the $6,000 mark. It has been subscribed by the New York dealers and accessory houses on a basis of $200 each by the former and $100 by the latter. At yesterday's meeting, Thomas F. Moore, who had been selected to manage the affair, tendered his resignation, following a motion that no money be expended without the approval and counter signature of the finance committee. Moore made a speech detailing his knowledge of the business, etc., and said he could not work to advantage under such an arrangement. Action on his resignation was deferred until the next meeting. The definite program for the carnival has not yet been arranged, although a parade with 1,000 cars in line, and a race meet are the uppermost projects.

Auxiliary Receiver for the Royal.

Judge Lacombe of the United States Circuit Court has appointed Arthur Berry auxiliary receiver for the property in New York City of the Royal Motor Car Co., of Cleveland, Ohio. The appointment was made on the application of E. W. Cottrell, of Detroit, a stockholder, and Witt K. Cochrane, of Chicago, a creditor for $4,800. The New York assets consist of automobile parts and accounts valued at $8,000.

Referee Accepts the Frenches' Offer.

Mr. and Mrs. Jesse French, Sr., have withdrawn their claim for $61,287.21 against the estate of the St. Louis Motor Car Co., Peoria, Ill. The withdrawal was executed after the referee in bankruptcy had agreed to their stipulations, i. e., that a certain touring car in factory be surrendered to them and that the estate waive all claims for balances alleged to be due for unpaid stock subscriptions.

BRITISH IMPORTS AND EXPORTS

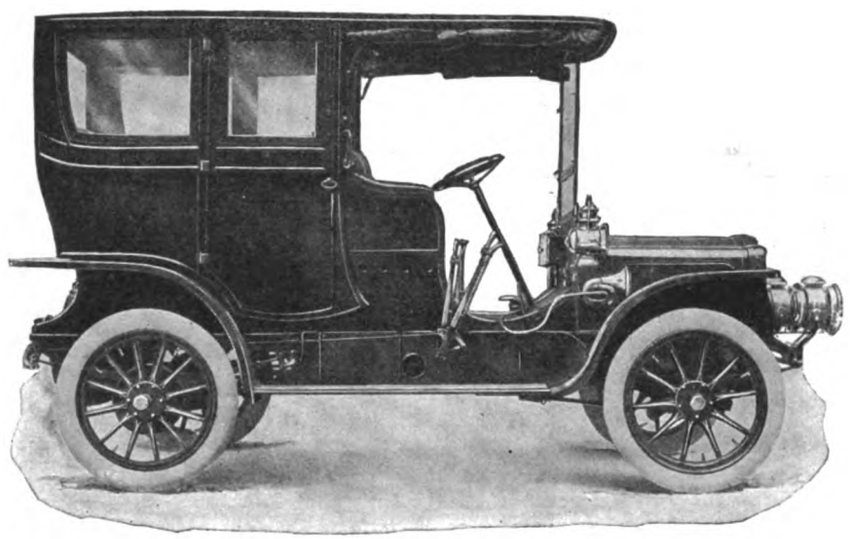
Figures for the Year Show Continued Preference for Foreign Cars—Sales to Other Countries Increased.

British imports and exports of automobile manufactures for the year ending December 31, 1907, revealed a continuance of that preference for the foreign-made article which has characterized its trade returns for some little time.

During the year no less than 4,819 cars were imported, having a valuation of $10,400,830, as against 5,776 cars brought into the country during the previous year, of a total value of $12,431,685. The total figures for 1906 and 1907, respectively, including the valuation of parts, were $21,858,300, and $22,763,430. Exports for the year amounted in total valuation to $6,638,490, of which $4,301,765 represented the declared valuation of 2,322 cars, and the balance, parts. The total exports for 1906 were $4,100,100, and for 1905, $2,513,570.

In December, 1907, 204 cars were imported into the British Isles, of a total valuation of $393,490, which with $733,970 worth of parts, brought the total up to $1,124,310, as compared with a corresponding total of $1,110,570, for the year previous. The December imports were the smallest of the year. Two hundred and six cars, valued at $386,975, and parts to the value of $168,990 were exported during the same period, the total exportation of $555,965, being lower than that of any month since August.

Traffic Department for N. A. A. M.



At the regular meeting of the executive committee of the National Association of Automobile manufacturers held in New York yesterday, Angus Smith, Olds Motor Works, and H. O. Smith, Premier Motor Manufacturing Co., were elected members of the executive committee to fill vacancies and F. H. Hart of the Corbin Motor Vehicle Corporation was elected a member of the association to succeed E. H. Brandt, who formerly represented the company.

The only other subject considered that was out of the regular routine was that relating to the establishment of a traffic or transportation department, which it was decided to inaugurate. It will be in charge of J. S. Marvin, who has been chief of a similar bureau in the A. L. A. M.

Thomas Henderson, Winton Motor Carriage Co., president of the association, presided at the meeting, the others in attendance being S. T. Davis, Locomobile Co.; W. R. Innis, Studebaker Automobile Co.; William E. Metzger, Cadillac Motor Car Co.; S. D. Waldon, Packard Motor Car Co.; Albert L. Pope, Pope Manufacturing Co.; Charles Clifton, George N. Pierce Co.; L. H. Kittridge, Peerless Motor Car Co.; and S. A. Miles, general manager.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exengencies of street traffic without any changing of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

Sympathy and Inhumanity.

Sympathy for the unfortunate is natural. It follows that there are those who will feel that justice was not tempered with mercy when a sentence of eighteen months' imprisonment was meted out by a New Jersey magistrate to the Newark automobilist convicted of manslaughter in having killed a pedestrian while recklessly driving his automobile, and who then hurried away leaving his victim to his fate.

That the automobilist was an educated man, standing well in the community, makes his action in running away the more reprehensible. Action of the sort is a species of inhumanity, brutality and cowardice for which written words are too poor sufficiently to express condemnation. Sympathy scarcely is merited.

The sentence of eighteen months' imprisonment is just and richly deserved. That the crime was committed without malicious intent was undoubtedly considered by the jury who found the verdict; but that mere "lack of intent" should be accepted as an excuse for manslaughter is intolerable.

No right thinking man can fail to condemn absolutely the cowardly action of any man in leaving an injured person to his fate, and it is hoped that the stand taken by the court may be the warning of an attitude more to be feared than the possible primitive punishment which may be meted out to the man who renders every aid and shows a willingness to meet the consequences of his action rather than to hope to remain undetected by running away and brutally leaving the victim of his accident to an unknown and uncared for end. That man lacks the elements of real manhood who does that sort of thing and merits any punishment that comes to him.

Where Drivers Should be Seated.

The accounts of accidents, resulting from collisions where trolley cars and other vehicles have crashed into automobiles that have unexpectedly changed their course, have became so frequent and the fatalities so numerous that the mere assumption of carelessness on the part of the chauffeur does not appear to be a satisfactory explanation.

It is not always possible for drivers of automobiles to be aware of the approach of rapidly moving vehicles coming from behind, in time to avoid accidents, and anything that will help in giving them the opportunity of knowing exact traffic conditions at all times is of extreme importance to those who are interested in the development of motor cars.

An arrangement of the control which will permit the placing of the chauffeur's seat on the left side of the car, instead of on the right, as is now the almost universal practice, should be given the serious consideration of designers, especially those who are interested in the development of the type known as town cars.

That the control should be at either the left or right hand is a matter of little moment, but that the chauffeur's seat should be in a position where he would have every advantage for driving is of prime importance.

When the chauffeur is seated on the right side he is at a great disadvantage in learning if a vehicle is overtaking him on his left—as required by the traffic regulations—at the moment when he is about to turn to the left; looking behind him on the right a large section of the street is hidden from him by his car. To have a clear view he must stand up and look over the back, or if the design of his car prevents that, he must leave his seat and look behind from the left. A turn to the right does not require any of these precautions. Vehicles are not supposed to pass him on that side and there is no occasion for extreme caution when changing his course in that direction.

The convenience of the passenger in a runabout, or in the front seat of a touring car, is another reason for the left drive. It obviates the necessity of walking around the car, frequently through mud and slush.

The argument that is sometimes advanced that shifting of levers would be unhandy to a driver, possesses little merit. A very little experience will suffice to make such an arrangement entirely practical.

It is fair to assume that chauffeurs realize that eternal vigilance is the price of safety and that generally speaking, all reasonable precautions are used to avoid collisions. The careful chauffeur is, and the careless one should be, constantly on the alert and any arrangement that tends to assist in the avoidance of accidents and the convenience of owners, is a long step in a right direction. Control from the left seat is a step of the sort.

About the Hydraulic Clutch.

In the way of an infinitely variable speed changing device for connecting the motor to the driving gear of the car, and aside from the ordinary friction drive, safe to say nothing is more attractive from the theoretical point of view than the hydraulic clutch. For some reason which, perhaps is best left to conjecture, however, this system is not undergoing the rapid development which might be expected. Indeed, up to this time, practically all designs which have been offered to the public, have been of foreign development and have not reached a sufficient degree of maturity to be installed regularly on a car.

The beauty of the hydraulic clutch is that it permits all possible ranges of speed by smooth gradations, at the same time providing means of carrying away the heat of friction which is an inevitable accompanyment of any alteration in the status of kinetic energy. With all mechanical forms of transmission in which the variable speed idea is entertained, even to the min-

Digitized by Google

imum degree contemplated in the friction clutch, there is always the chance that through extraordinary pressures, or other adverse conditions, the temperature of the working parts may be permitted to rise sufficiently to cause abrasion. With the hydraulic clutch this is impossible because the fluid is constantly circulating and is ever in contact with the walls of its containing passages, the greater portion of which are freely exposed to the air, and suffer no danger of abrasion in any way. This being the case, the only material effect of heat due to overworking the clutch must result in evaporation of the lighter ingredients of the fluid and hence in thickening it. To counteract injury on this account therefore, it is only necessary to renew the supply of fluid from time to time—a far simpler process than that of renewing the leather of a cone clutch, or the plates of one of the disc type.

Another point which is worth considering in this connection, is that the so-called hydraulic transmission, of which one or two designs have already been developed, is nothing more nor less than the plain hydraulic clutch subdivided in such a way that the driving and driven elements may be placed at the extremities of the power plant instead of adjacent and co-ordinate, as it were. Hence, simplicity and economy of construction, argue the use of the clutch rather than the transmission which carries the same principle on a more extensive plan.

There are several obstacles in the way of the design of such a system. Chief among them is that of the difficulty of regulating the amount of "slip." Generally speaking a clutch that is adapted to afford a desirable amount of slip in starting, fails to hold perfectly when complete engagement is required. This principle would seem to apply regardless of the method employed in effecting the connection. On the other hand, none of the purely mechanical devices yet submitted to the test of practical use have proved to be perfectly satisfactory in this respect, and it is reasonable to suppose that the difficulty of slippage on full engagement may be gotten over with the hydraulic system by the use of some method of positive engagement, if it be not possible to effect it directly and by a more ideal method. Certainly the field is one of the most attractive imaginable, and its exploration has not as yet been carried to such a point that the inventor need be seriously hampered in carrying out his ideas.

TO TEST INTERCHANGEABILITY

Something New in Contests—Reassembling of Dissected Cars to Precede Speed and Endurance Trial.

One of the most unique trials ever scheduled is soon to be undertaken in England under the auspices of the Royal Automobile Club, in which, oddly enough, the only entries will be that of the Anglo-American Motor Car Co., British agents for the Cadillac cars. This test will consist of the complete dissection of three of the 8-10 horsepower cars which are so well known in this country, their re-assemblage after inspection by the committee in charge of the affair, and the subsequent speed and endurance test on the Brooklands track. The object is to prove the claim of complete interchangeability which is one of the strong "talking points" of the Cadillac policy.

The plan is to have the Expert and Technical Committee of the club select any three cars, either from stock, from the importing crate, or from actual service, each machine to be held under rigid observation until the conclusion of the test. Under the tutelage of the committee, they will then be reduced to their lowest terms, and all the parts from each machine will be mingled in an indiscriminate heap on the floor of the club garage. From the pile, the judges will then select the proper number of parts and sort them into three separate heaps, from which employes of the agents will be required to construct three new machine. On request of the committee, it will even be permissible to introduce new parts from the agents' stock of spares, in order to prevent any possibility of special preparation for the test.

The final proof of interchangeability, which is to succeed a close inspection of the rebuilt cars by the judges, will be a test run on the Brooklands course, in which each machine, carrying two passengers, will be called upon to cover not less than 500 miles. Needless to say, the project, which is to be put into execution next month, is attracting a great deal of attention.

To Woo the American Dollar.

That the attractiveness of American dollars has suffered no diminution in the eyes of the gentlemen on the other side of the pond is shown by the organization of a British branch of the "Association Generale Automobile of France," for the purpose of "affording American motorists, who desire to tour Great Britain and the Continent, every facility for a comfortable journey with no discordant features," save frequent recourse to their letters of credit; and as a real live lord will assist in promoting that process it possibly may be made more agreeable than otherwise would be the case.

COMING EVENTS

February 1-8, Providence, R. I.—Show in Providence State armory.

February 3-8, Kansas City, Mo.—Kansas City Automobile Dealers' Association's annual show in Convention Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association's show in Central armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

February 22, Boston, Mass.—Bay State Automobile Association's 150 miles endurance run to Providence, Worcester and return.

February 24-29, Portland, Me.—Annual show in the Auditorium.

March 2-7, Ormond, Fla.—Annual beach carnival, under auspices Automobile Club of America.

March 7-14, Boston, Mass—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

March 18-25, Rochester, N. Y.—Rochester Automobile Club's show in new Convention hall.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

The announcement, which comes from London, proclaims that this organization is provided by the establishment in that city under the auspices of Lord Montague of Beaulieu "of an organization which cooperates with another" which has a network of agents all over the world.

Just what part will be performed by Lord Montagu of Beaulieu is not stated unless indeed he will be "one of the accredited agents," with tours mapped out, who will meet Americans on their arrival at any of the chief English ports and guide them through the country or pass them across the Continent from one country to another without any further trouble over the customs duties after the necessary licenses have been obtained "by the payment of merely the official charges."

As the cost, aside from the "usual official charges," will be only $25, the American tourists are assured of an intercourse with members of the nobility at a price within the reach of all!

MORRELL WANTS MORE ENTRIES

Despite His Previous Dictum, They Will be Thankfully Received—Eighteen Nominations for Briarcliff Race.

Despite the positive assertion of Chairman R. Lee Morrell that unless twenty-five entires were booked by February 1st, there would be no race for the Briarcliff trophy race on the roads of Westchester county, New York, April 24th, the first of February came and went and—although but 18 entries are in hand, the race is not off and Morrell is still willing to accept entries at $1,000 each.

When the entries were supposed to have closed on Saturday last, 1st inst., 18 cars had been nominated, according to the list made public, which was as follows, the name of the drivers being in parenthesis:

Paul LaCroix, Renault (Bernin); C. M. Hamilton, Isotta-Fraschini, two cars (Poole and Harding); J. H. Tyson, Isotta-Fraschini (Strong); H. A. Lozier, Lozier, two cars (Mulford and Michenor); C. B. Tangeman, Hol-Tan (Fosdick); C. A. Singer, Simplex (Tracy); E. Rand Hollander, Fiat, two cars (Cedrino); S. B. Bowman, Apperson (unnamed); A. Hammerstein, Allen-Kingston (Campbell); J. J. Brown, Maja (Murphy); Harry S. Houpt, Thomas Flyer (Roberts); H. W. Whipple, Stearns (Oldfield); Wyckoff, Church & Partridge, Stearns (Vaughn); F. B. Stearns, Stearns (Leland).

As this formidable list was seven cars short of the requisite number, the "advisory committee," composed of newspaper writers, was asked for "advice"; at the same time it was stated that Morrell had three more entries tucked in his vest pocket. Being vest pocket entries their identity was not disclosed.

Adding 18 and 3 together Mr. Morrell correctly gave the answer as "21," which, plus 4 would make "25," so would it not be advisable to hold the entry list open a little while longer? The advisory committee naturally agreed that Mr. Morrell's mathematics were correct and all hands will make efforts to secure a few more cars.

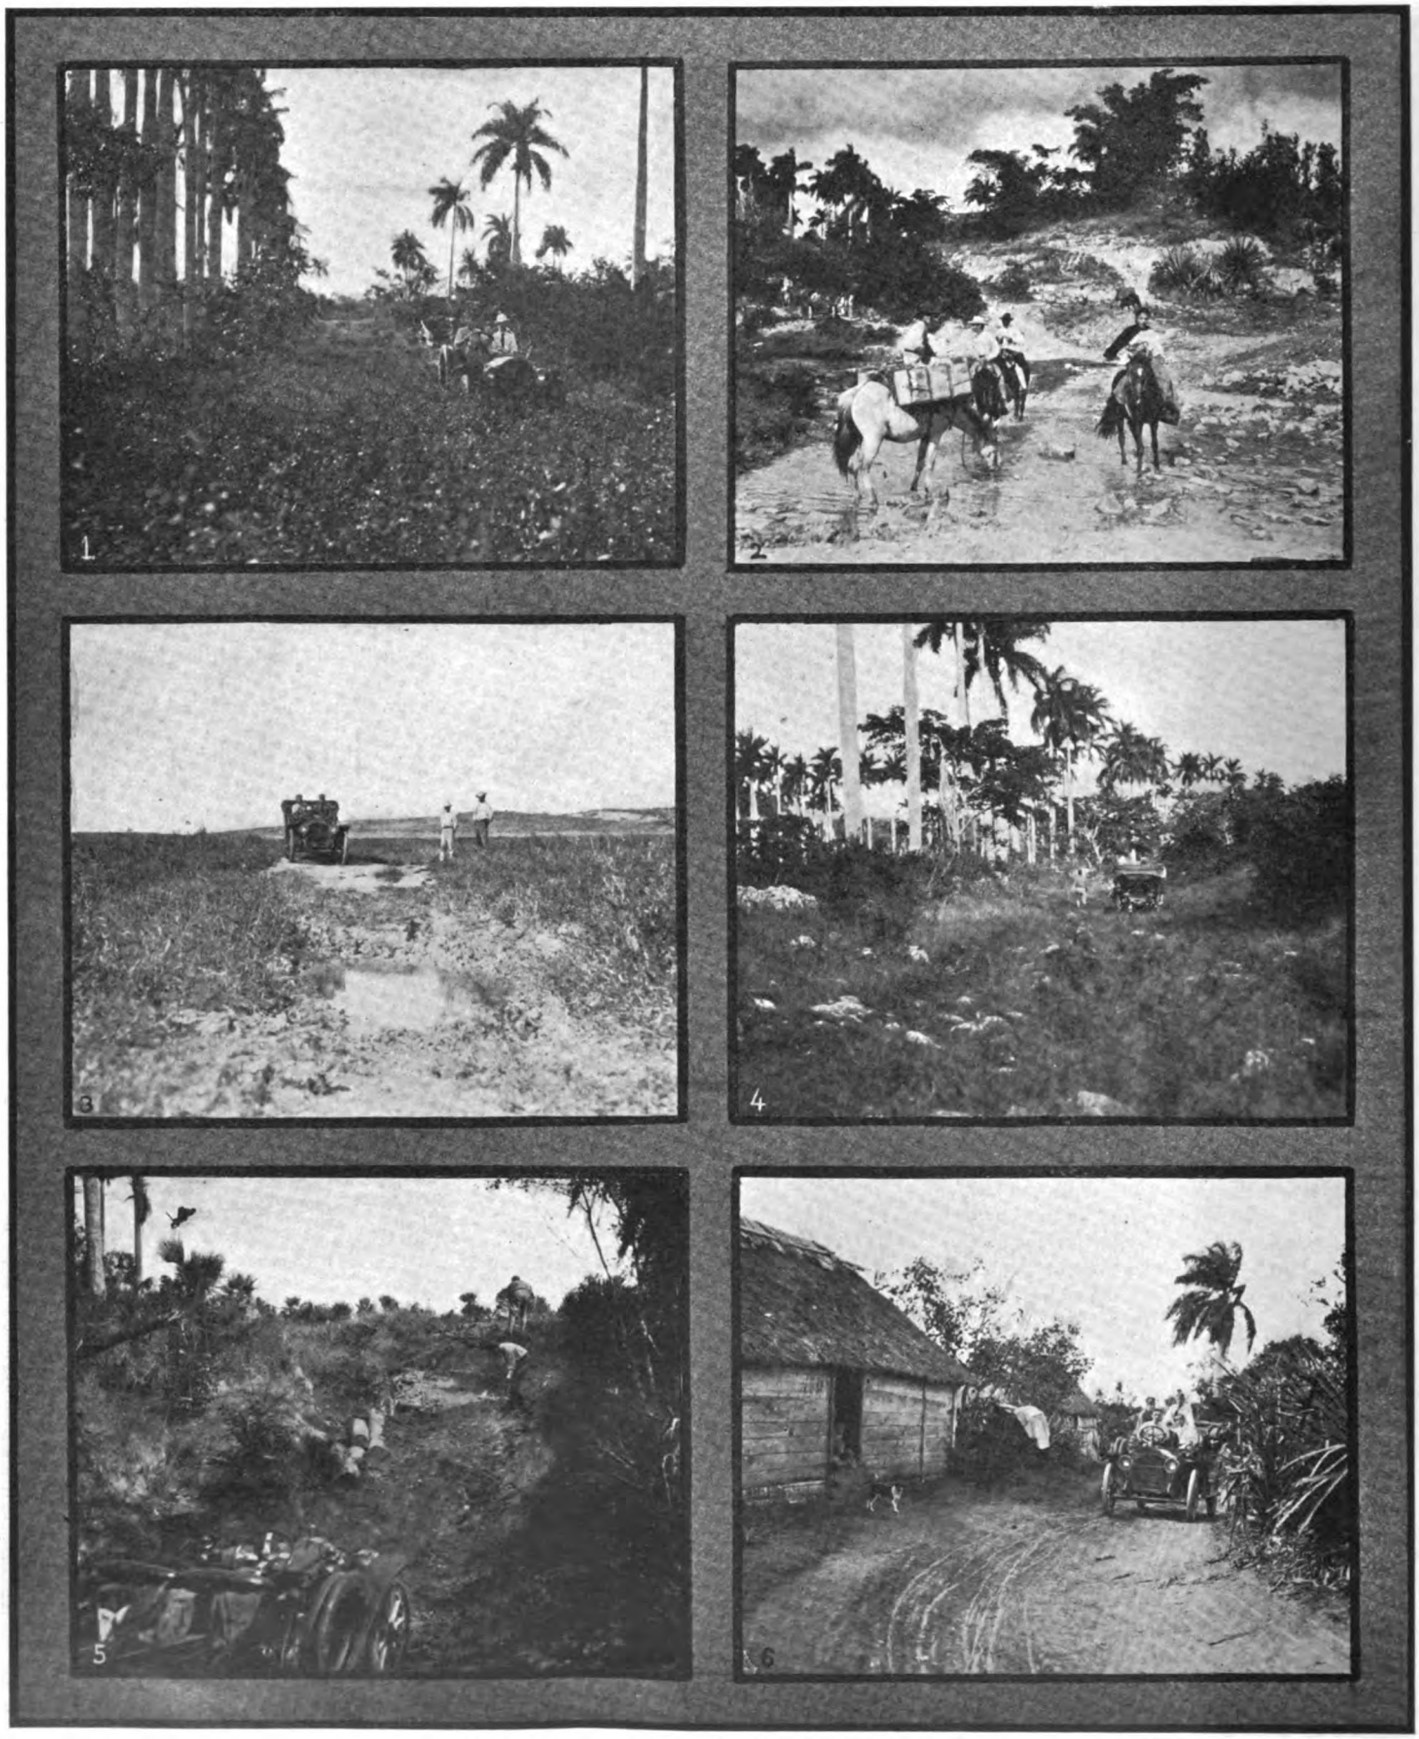
While the necessary entries have not been received, those drivers who expect to participate already are training on the course and some of them admit that the course is far more dangerous than the Long Island Vanderbilt course. Joseph Tracy, of long experience and conservatism, who will drive a Simplex, asknowledges that the worst portions of the Briarcliff course are "very much worse than the Vanderbilt danger points." With twenty of its thirty miles consisting of wriggles and twists and angles and bad curves, to say nothing of steep hills and narrow roadways, the Westchester course, as the Motor World previously stated, is chockful of "possibilities."

STRAIGHT MILE OF MACADAM NEAR THE FINISH

Strangely enough, the grandstand will be located between Eastview and Briarcliff where the spectators will not be able to see more than 100 yards from the start because of two sharp turns and bendings of the road beyond a hill. On the other side of the grandstand the cars may be seen on at least a half mile stretch of straight road, one of the very few stretches of the kind on the entire course. The accompanying picture of the road near the grandstand location will convey a good idea of the twisting nature of the road. The only opportunity for safe fast work is on the straight road near Briarcliff.

The exact distance of the race has not been fixed. The time limit—not for the entries, but for the race—has been set, however. It will be eight hours.

Bill to Prohibit Road Racing.



Although preparations for the Briarclift race are going on it will be impossible to hold road races of any sort if the measure prepared by Assemblyman Yates becomes a law. The bill, introduced yesterday, repeals that section of the New York State law which gives town boards and boards of supervisors of a county the right to set aside roads for such purposes.

PACKARD EXPLORATION IN CUBA

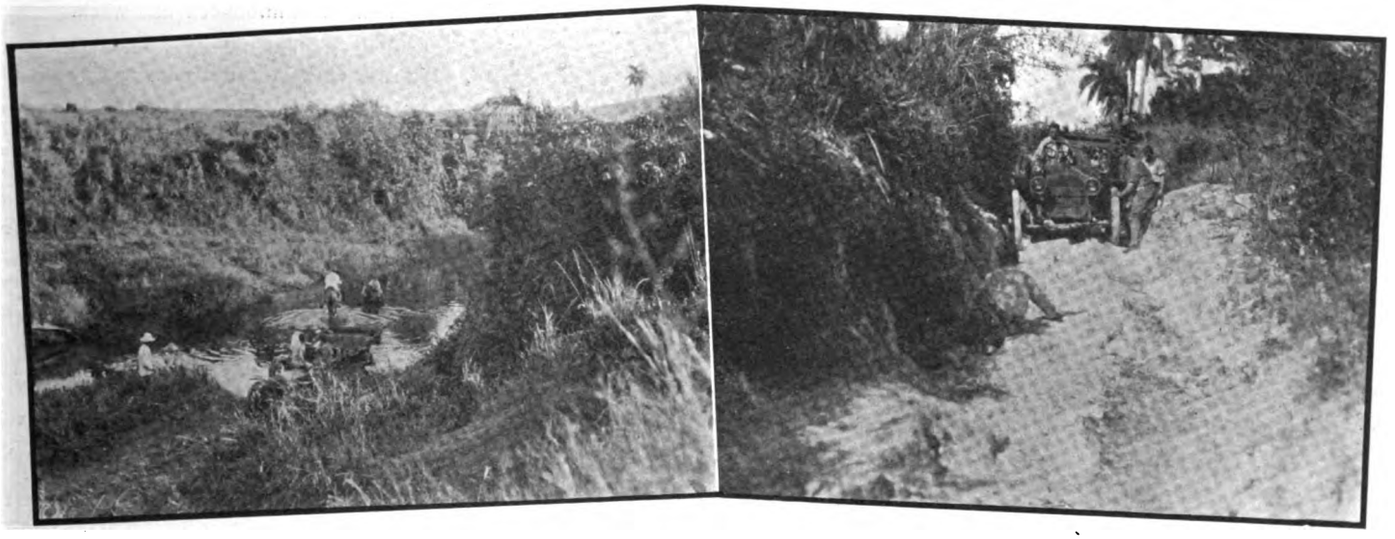
Despite Reports to the Contrary There are no Good Roads—Strenuous Experiences of the Explorers.

To travel hundreds of miles in Cuban territory through which no four-wheeled vehicle of any kind had been before was the recent automobiling feat of S. D. Waldon, sales manager of the Packard Motor Car Co., and party, in a Packard "Thirty." The wide advertisement which has been given the few good roads which lead out of Havana in certain directions, conveys a wrong impression of travel generally throughout the country. When Mr. Waldon accompanied by Edwin S. George, Fred Crebbin and E. Ralph Estep, arrived in Havana and announced the fact that they intended to do a little touring in interior Cuba in a motor car, there went up a general protest. Hotel men, the American garage owners, sugar planters, railway men, guides and interpreters all said: "It cannot be done."

The interior is without roads. Horse trails lead from one place to another. There is no long-distance traveling. The only vehicles which attempt to go about the country are the high-wheeled ox-carts for hauling sugar cane. They are drawn by three or more yoke of oxen. Their wheels are from seven to ten feet high. They cut the soft ground into parallel lines of wide ragged ruts two to four feet deep. Where the ground is hard it is littered with immense boulders or else itself is the base rock of the island. Then the rough trail may wind into a region where there is nothing to mark the route but the sun or compass, and no break in the succession of long, tedious miles of persistent traveling through grass as high as the car.

From lowlands and plateaus the way leads into rugged hills and mountains. Here the road taken by the Packard tourists was a continuation of washouts and ravines which formed the only way through the mountain passes. Each day there would be from three to ten rivers to ford. Cuban rivers flow deep, between banks 50 to a hundred feet high. Their beds had to be reached by following the tortuous channel of some erstwhile mountain stream which had once run into the main river. Then came the ford, with the car on the uncertain footing afforded by the solid but uneven rock of the river bottom.

During the latter days of the journey the heavy rains of a delayed wet season turned the red clay into a trail of sticky, heavy mire and created in every valley and low spot a seemingly bottomless hole. In several instances they were so wide and deep that it was necessary to build a rough corduroy of palm logs and underbrush in order to cross.



Travel was, of course, slow. Some days 30 to 40 miles, one day 63 miles, and then one hard-fought day's journey of 14 miles. It was on this day that three deep rivers, within a few miles of each other, were forded in the heart of the Santa Fe mountains. Many times the road was so difficult that the easier way to progress was to open fences and drive into and through fields. These might be plowed ground, rough, wild grazing lands or sugar cane fields where the path would have to be taken in the uneven lane between the tall cane and the fence.

Each day the condition of the country would change. One day after running out of rocky hills where the car had clambered over areas so uneven that the front tires actually would be pulled from the rims, there was encountered a broad level tract in which there was nothing but grass, brush, stones and palm trees as far as the eye could see. Steering by the sun, the tourists were lost in the barren country for hours, and reached a populated section only by striking out of the general direction toward the railway, and then following it.

Each night the tourists stayed where they were at dark. Traveling at night was impracticable, and as there is no twilight in Cuba, it was necessary to accept the accommodations at hand when the sun set. The first night out a camp on the ground was made at the bottom of a deep valley, supper being obtained from a Cuban farmer. Succeeding nights were spent on cots or in hammocks in the sheds or living rooms of farm houses and country general stores; one night was sleepless, with all four tourists bunked in a row on the table of a sugar mill eating house; while the most unique night's rest was that spent in hammocks swung under the thatched roof of a commodious pig pen.

The general direction of the tour was from Havana to Matanzas; thence, via Jovellanos and Macagua, to Santa Clara, and from there, by a crooked route through Camajuani and Placetas, to Sancti Spiritus. The car was without special equipment, except the axe, mattock and shovel picked up en route for use by the engineering department. At the suggestion of a Cuban farmer, who had witnessed the way in which the Packard had raised herself out of a deep mud hole after having been given a foundation of stones on which to obtain traction, the car was nick-named El Toro. This name, roughly painted on the sides of the car, immensely pleased the rural Cubans, who, of course, had never seen any other automobile.

Of experience there was a plenty and the tourists have tales to relate which seem almost unbelievable—tales of unprecedented hill-climbing up jagged rock stairways that seemed as though they would tear the car to pieces; of wallowing in the long chain of mires and bogs which made up the road of several days; of fording rivers by following the narrow ridge of high places on the bottom; of wonderful feats in quick road engineering to avoid unnecessary work, and tales of the innocent Cuban inlander, his country, his family and his food.

CHIP ON THE MAXWELL SHOULDER

Twelve Cylinder Marvel Ready to Meet All Comers Under Dewar Conditions—Two Miles a Minute Cars Eligible.

If any one anywhere in the world has any kind of a car they think can "go some" all he needs to do to get on a race is to notify the Maxwell-Briscoe Motor Co., at Tarrytown, or Robert Lee Morrell, of the contest committee of the Automobile Club of America. For the Maxwell people think they have the car that can do a mile in at least 27 seconds.

The Maxwell speed creation has no less than 12 cylinders which develop 180 horsepower. The car has been built for some time; in fact, it was constructed for the last Vanderbilt cup race, but has been greatly improved and now is ready to meet all comers.

MAXWELL MULTICYLINDER RACER ON TRIAL SPIN

The Maxwell people naturally were disappointed when the Dewar trophy race was scratched from the Florida program, as they had designs on that trophy, and now have issued a sweeping challenge to all speed merchants, whether advocates of steam or gasolene, to meet them in a race under the Dewar conditions, either during or immediately following the Florida beach tournament. Further than that, they say their multi-cylindered racer will be in evidence for the Dewar trophy whenever the race is held, and have asked Morrell to arrange a contest.

Long Islands Promote a Winter Test.

If the present spell of cold weather continues the Long Island Automobile Club, of Brooklyn, will on Tuesday, 25th inst., hold what it thinks will give the contestants some of the rigors of a New York-Paris race, via Alaska and Siberia, without all of its hardships. On that day it will hold a 242 miles economy test, from Brooklyn to Montauk Point and return.

The proposed economy run does not differ in any way from others of the sort that have been promoted by the Brooklyn organization. No penalties will be made for repairs, replacements or adjustments to car or tires, the only condition being that the contestants must complete the 242 miles within the set time, made the night before, and based on road conditions at that time.

The winner will be the car that carries its full quota of passengers at the lowest cost for each person, fuel and oil only to be considered. Gasolene will be charged at the rate of 25 cents per gallon and lubricating oil at $1.00 per gallon. Instead of sealing the tanks each car will be given sealed cans of fuel and oil, which will be in charge of the observer.

Entries will close on February 20th, although they will be received until 6 p. m. the day before the contest, at an additional fee. Dealers will be limited to three cars each, the entry fee for the first being $25, for the second $15, and for the third $10. The prizes have not been selected, but it is stated that $200 will be expended for the first, $100 for second, and $50 for third.

Holding Motorists Wholly Responsible.

It is the driver's business to look out for the pedestrian, and not the latter's business to evade automobiles. Such is the substance of a decision by the District Court of Appeals in Los Angeles, which declares in effect that pedestrians cannot be charged with contributory negligence if they do not keep out of the way of automobiles. The decision confirmed a judgment for $7,000 damages awarded Stanley King, who had been injured by an automobile of E. K. Green.

Boston Arranges Endurance Run.

Boston is to have an endurance run on February 22d. This was decided by the Bay State Automobile Association last week. The route will be from Boston to Providence, then to Worcester and back to Boston, making a triangle of 150 miles.

AUTOMOBILE SPEEDWAY IN JERSEY

Another Project for the Construction of One in the Lakewood Region—Philadelphians Incorporate.

For about the fortieth time that stretch of waste land which is situated southwest of Lakewood, N. J., is to be converted into an automobile speedway. Since the subject was first broached more than two years ago there have been numerous companies organized to build a course through the pine forests there, but like most projects of the sort they died the natural death. The latest scheme for the realization of the proposition was announced this week.

Philadelphia capitalists, it is stated, under the title of the Hanover Consolidated Co., of New Jersey, have acquired 20,000 acres of land in Burlington and Ocean counties and have decided to build an automobile speedway twenty miles long and 100 feet wide. This differs materially from all previous New Jersey schemes; they were to have been five mile circular tracks, but the several companies promoting them have not been heard of since. Whether they ever succeeded in selling any of their stock is not known.

According to the announcement it will cost about $400,000 to build the track, club houses, garages and other things of the sort, which usually play a leading part in the plans of speedway promoters. The capital stock of the new company is $600,000 and the Colonial Trust Co., of Philadelphia, is named as the trustee. It is planned to locate the speedway between Brown's Mills Junction and a point twelve miles south of Lakewood, which would make it near Toms River. The land is absolutely worthless except for sites for proposed speedways and for unscrupulous real estate sharps who find admirable building sites there.

"First mortgage gold bonds to the amount of $400,000 will be issued and sold to meet the expense of the erection of the speedway, club house and garages," says the announcement. "All holders of 100 shares of stock in the Hanover Co. will be entitled to full membership with all its privileges and free entrance to all races perpetually."

Contrary to most schemes of the sort the promoters do not keep their names in the background, but publish the full personnel of the Hanover Consoldated Co., as follows: President, William H. Wile; vice-president, John P. Harlan; treasurer, E. T. Davis; secretary, George A. Kiefaber; directors, William H. Wile, George A. Kiefaber, S. J. Phillips, E. T. Davis, W. S. Wilson, John P. Harlan, William H. Wile, Jr., and A. McCracken, all of whom are residents of Philadelphia.

Motor Cars as Mediums for Municipal Graft

Concluding Story in Which is Included Extracts From the Diary of a Municipal Chauffeur, Showing Just How and for Whom the Taxpayers' Automobiles are Employed in Private Service—Speed and Lamp Laws not for City Officials.

In last week's instalment of my story, I told of my first experience in being placed under the orders of persons who were not in any way connected with the department for which I worked, or connected in any way save by ties of relationship or friendship with the municipal servants.

There are those who may maintain that if I actually possessed the pride or self respect that I claimed to possess I could not and would not have obeyed an order that was so manifestly improper if not actually dishonest; and there may be captious critics of my conduct who will say that I should have refused to permit my services to be placed at the command of women, and that I should have insisted on being used only for the work of the department; these critics will maintain that I would have won the point, as the inspector would not have dared to incur the notoriety I could have caused by bringing the matter before the city authorities in such a way that the daily papers would have revelled in the opportunity for devoting columns to a subject that with its many side details furnished choice scandal in public, as well as in private life.

But in suggesting this solution of the problem my personal feelings are not taken into consideration. In the first place I am opposed to notoriety, and would not consider a course of action that would place me in the limelight; besides, I liked the inspector for many of his personal qualities. Our relations were entirely friendly. Above all, I could not bring into a personal grievance the names of women who were respectable, or the names even of other women who possibly had had respectable parents, and this would have been required of me if I had made any claim of unfair treatment or had endeavored to make my position more agreeable by appealing to the higher authorities, and calling to their attention the nature of my work.

Lures of Public Position.

It is true, I could have resigned, but my several years in the department had caused me to look upon my position as being necessary to my maintenance. I did not realize that I could do as well in the outside world, a world that seems very foreign to the municipal employe who learns soon to believe himself a thing apart from other mortals, and I thought of my home and those dependent on me and was willing to make great sacrifices of myself rather than to bring worry and care and an uncertain future into the home circle. And through it all was the constant thought, "It can't last."

Then, too, as a municipal chauffeur, I was given certain privileges over other drivers that were not without an effect on my estimation of, if not of myself, of my importance to the community: the right of way was mine if the department sign was on the car, or if the police officer recognized me as a part of the city administration. The speed laws may have been made for others, but I was exempt. If I entered into a friendly race on a public highway with some innocent chauffeur he was promptly arrested and I was not required to even slow up lest maybe some important city business be delayed! I used lights at night only when agreeable to me. If I was out of oil or gas I didn't bother to replenish the supply until it was entirely convenient.

Indifference to the Law.

One night when I was speeding on one of the driveways, my tail light went out and a policeman noticing it as I passed gave chase on a bicycle; several blocks were traversed before a trolley car caused me to reduce speed, and he caught me. First, he declared me under arrest for traveling at the rate of 20 miles an hour, also for driving without a light at the back. I responded by telling him what I was, and further directed him to light the offending lamp for me, and he, wise in his generation, knowing that the influence of my superior might cause him to be transferred to patrol duty, complied and explained his mistake in delaying me by stating that he did not know it was a city car, as no sign was displayed. While all this was going on, the inspector and a woman companion held their peace in the tonneau.

These liberties were not without their influence. I enjoyed the feeling of immunity from arrest. I was frequently envied by "private" chauffeurs who wanted the same security and it all tended to make me desirous of retaining the position.

There were times, though, when the breaking point was so near that it is remarkable it was not reached. An instance of a near approach to "mutiny," insubordination," "failure or refusal to obey orders," or anything else you may care to term it, occurred one night when I had driven the inspector and his sister, and her three children to one of the popular eating houses of a resort about twenty miles away. It was midnight when I left her at her home and there was still an hour's work before me, as he had to be taken to his apartments after which the machine must be brought back to its regular shelter, about three blocks from the sister's home. As he left the car—it was nearer 1 a. m. than midnight—he directed me to meet his sister at 7 in the morning and drive her to the depot as she was going away for her summer vacation. The injustice to me, the absurdity of the idea is apparent when I state that she lived one and one-half blocks from the depot, and it is fair to assume that before "Brother's" unexpected affluence, walking was considered a desirable means of locomotion, even when distances much greater were to be traversed. I failed to appear on time and the lady walked. Expecting trouble as the result of my "failure to obey orders," I prepared an address, the chief characteristics of which was directness rather than diplomacy, but no occasion arose for any remarks as the inspector made no comment when I merely reported "too late; your sister had gone." It may be that he saw "blood in my eye," or perhaps the proposed ride of a block and a half was an incident of too little importance to become the cause of an official censure.

Rendering Menial Service.

From time to time I was directed to attend to little personal affairs of the inspector, such as carrying his soiled linen to a laundry; delivering to some one a grip he had loaned, and later going after it; moving the effects of a friend who changed from one boarding house to some other, and little things of this sort. There were so many of these "municipal duties" that to recite even the majority of them would be tiresome and would be the means of causing the accusation that I grossly exaggerated, if indeed, I was not lying.

As an evidence of the fact that I am not relying on memory or citing instances which occurred at long intervals, I append here extracts from my diary. These are the records of consecutive days, made at the time and now copied without additions or changes, save that I have used substitute names for the individuals and places in lieu of the correct ones, which are contained in the diary.

The day of the arrival of the mother and father of the inspector from their little home in the country, seems a fitting place to begin the diary records:

"Monday, 8th.—In shop from 8 a. m. until 4 p. m., working on chains; then to depot. Met inspector's father and mother, also the inspector; drove to sister's house in the suburbs; joined by sister, drove to

Digitized by Google

Athletic club for dinner; joined there by brother-in-law and brother; left at 9.40 for suburban home, where we dropped mother, father, sister and brother. With others drove to inspector's rooms in the Bleakside. Raining hard. Three blow-outs after leaving him. Got in garage at 3 a. m. Nineteen hours' work.

"Tuesday, 9th.—Left garage at 7 a. m. At suburban house at 8. Father, mother and brother to excursion boat; tinkered car as chains were bothering until time to meet return boat at 5 p. m., when father, mother and brother rode to the Bleakside, where they left me. Met the inspector and drove him to a restaurant where he had an appointment with Mr. Cutting. Supper at 8.30. Picked up inspector, drove to another restaurant, joined by father, mother and brother. Back to suburban home; dropped relatives and picked up stranger, who returned to the Bleakside with the inspector. Was to have taken stranger home, but a chain had been coming off frequently, so I went direct to garage to repair it in readiness for next day. 17½ hours.

Joy Rides Day and Night.

"Wednesday, 10th.—Left garage at 8 a. m. Went to manufacturer's shop and had new emergency drum put on rear wheel. Drove to suburban home where father and mother entered car; returned to the Bleakside, joined by brother; made a round of calls; then to depot; brother left; returned to suburban home, parents left; then to garage—only 12 hours.

"Thursday, 11th—In garage at 7 a. m. Cleaned engine, oiled and made some adjustments; drove to suburban home, where father and mother got in; took them to the Bleakside; joined by inspector; went shopping; drove to depot, father and mother left on train; drove inspector to the Bleakside, then to the Clear Wilde apartments where Mrs. Blank and Mrs. Dash joined us, also Mr. Goode. Drove to Mellwood inn—me to the kitchen—returned to the Clear Wilde, dropped Mrs. Blank and Mr. Goode. Drove through park for an hour, then to within a block of Hotel Hartford where Mrs. Dash left us and walked to hotel. Then to the Bleakside. Garage at 11.30 p. m. 16½ hours.

Friday, 12th.—Didn't show up until 10 a. m. Drove to office. Inspector did not come out until 12. Drove to Willmot's restaurant, which he entered; at 4 he came out with Mrs. Dash; she left him and I drove him to Hotel Wellingford; joined there by Mr. Close and his fiancee; drove to the Bleakside, where the inspector's room mate, Mr. Clear, joined us; then to Woodyview inn, at which place some sort of a function at Mr. Close's expense, occurred. I fared well in the servant's quarters. Returned to the Willingford, dropped Close and fiancee; to the Bleakside, where inspector and Clear left; then to garage at midnight. 14 hours.

"Saturday, 13th.—As I didn't have to go out until 11 a. m., spent 3 hours trying to fix rear right wheel where the chain was noisy and troublesome. Was at the office at 11. Joined by inspector after a 2 hours wait; drove to Hotel Graham; joined there by Mrs. Dash; drove to Innwood restaurant, where inspector and Mrs. Dash were left while I drove to home of Inspector's friend and presented a letter; later I returned to Innwood and took inspector and Mrs. Dash for a short drive. Left Mrs. Dash at a point where she could get a trolley to her hotel; drove inspector to automobile agent who took him for long demonstration ride; but I was off at 3.30—only 7½ hours.

"Sunday, 14th.—Off. (This does not occur frequently.)

"Monday, 15th.—In shop from 8 until 5. Transmission needs overhauling.

"Tuesday, 16th.—In shop from 8 until 5 on transmission.

Excessive Wear Ignored.

"Wednesday, 17th.—In shop at 8 with orders to positively have car in running order by night. At 5.30 p. m. took car out not nearly finished. Went to the Bleakside where inspector and his room mate got in. Drove downtown; nearing the house where I had been ordered to stop, Mr. Clear left us. Lots of ignition trouble. Joined by inspector's cousin; drove them to Latan's for dinner. During the two hours' wait I straightened out some ignition difficulties; then he and she came out; although one of the chains was continually coming off, owing to a worn out rear sprocket, he insisted on a drive through the parks and boulevards. Took cousin to downtown home, then returned to the Bleakside. Chain had come off eight times. Returned to garage at 12.10 a. m. 16 hours.

"Thursday, 18th.—Found that the inspector had ordered another chauffeur to take the car to the manufacturer's shop to have sprocket put on. During the trip the wheel was broken. I had been excused until 4 p. m. When I found the car was out of commission I went to the Bleakside. The apprentice was there with the little car. I took this from him and when Mrs. Dash, Mrs. Blank and Mr. Goode came out of the inspector's apartments they brought instructions from him for me to take them riding. As the little car had only three cylinders in working order, they quickly tired of their ride, and a restaurant became their destination, after which I returned to the repair shop at 8 p. m.

"Friday, 19th.—In shop from 8 to 5.

Saturday, 20th.—Big car in commission again. Directed to wait orders from Mrs. Blank. At 2 p. m. received message to have car at Clear Wilde apartments at once; she and Mrs. Dash were waiting; made some calls; drove through park; dropped Mrs. Dash at her hotel; joined at Clear Wilde by Mr. Goode and Dr. Keene; drove to Woodyview, where they had dinner and I had dinner and other things in the servants' quarters. I accepted Goode's invitation and had cigars, drinks, etc. First time I have taken liquor when driving, but I'm played out; had tire trouble in the afternoon. It rained at night and chain trouble occurred. Returned the party to the Clear Wilde, then to garage at 12.15 a. m.—16¼ hours.

"Sunday, 21st.—Inspector out of town. Off again.

"Monday, 22d.—From 8 until 5, in shop. Put on new sprockets, then to the Bleakside, where inspector got in; then went to the Clear Wilde; joined by Mrs. Blank and Mr. Goode; drove to Hotel Reem where they had dinner; then to the Clear Wilde where Mrs. Blank left, after which to a point where we watched a department demonstration of a new disinfecting scheme for two hours—my first work in the city's interest in many weeks. In garage at 12.15 a. m.—16¼ hours.

"Tuesday, 23d.—Met the inspector's father, mother and brother-in-law at boat-landing at 8 a. m. Drove to depot where father and mother left; took brother-in-law to office; waited four hours, then drove him and Mr. Goode to ball game. After which the inspector joined them; drove to the Clear Wilde, where there was a wait of an hour, then the inspector and brother-in-law came out and were driven to the Bleakside. Reached garage at 8 p. m.—12 hours.

"Wednesday, 24th.—In shop on transmission.

"Thursday, 25th.—In shop on transmission.

Queer Places Visited.

"Friday, 26th.—In shop from 8 until 4, then to office; drove inspector to Hotel Niagara; joined by Messrs. Gay, Close and Dr. Keene; drove to Mr. Gay's house and got his baggage; to a cafe; to depot, where Gay left us; then to Waterview, where they spent two hours at dinner, during which, in an unexpected moment one of the party fell through some shrubbery to the great dismay of the proprietors and discomfort of other patrons. Later we went to a residence of heavy curtains, and solid doors where all left the car and I went to the garage at 11 p. m.—15 hours.

Saturday, 27th.—To the office, where a message directed me to a hotel; joined there by inspector, Mrs. Blank, Mrs. Dash, and Mr. Goode. After an hour's drive Mrs. Dash left at a point near her hotel, while we drove to boat landing where the inspector left; then to a friend's residence, joined by him, went to Woodyview for dinner, after which the different members of the party were returned to their respective abodes and I to the garage at 12.15 a. m.—12¼ hours.

But why go on? Is not my contention proved that the city's business had but little of my time or services? I have reproduced a record of consecutive days. I can skip here and there and give instances of rides out of town, of one occasion when the odometer showed 162 miles for the day's trip, and the only passengers were a law-

Digitized by Google

yer and his woman friend, and in justice to him I must say that he paid for the gasolene used and wanted to pay me for my services. He was the only one who ever did the former or offered to do the latter.

The machine was frequently loaned to friends, the city paid for its upkeep and maintenance; tires, gasolene, lubrication were paid for by the taxpayers; the salaries of the men in the repair shop came out of the city's funds, and all in all, it was graft from beginning to end; it was dishonest and it was illegal. And the inspector to whom I was assigned was but one of many city officials who similarly misuse the city's property. I saw and heard enough of other officials to make certain that my original statement that 80 per cent. of the use given the city's cars is illegitimate and dishonest use.

Inspecting While Asleep.

Can any one, by a stretch of imagination, discover anything akin to municipal duty in a trip at night when an inspector and a man friend have dined both well and very unwisely? Perhaps not; but, even this kind of "duty" fell to my lot. On an occasion of the sort, the inspector ordered me to drive about the city as he desired to inspect certain public conditions.

Within five minutes after we started there were snoring noises coming from the tonneau. I turned and saw that both men were "dead to the world" so I drove where fancy dictated for a couple of hours, and finally stopped in front of the inspector's apartments, and after much effort awakened him.

"Will you do any more inspecting tonight?" I asked, and there was no tone of "envy, hatred or uncharitableness" in my voice.

It took him a minute or two to realize where he was, what he was doing, or what he supposed he was doing, and then the answer came:

"No; I guess we've seen enough for tonight." And awakening his companion, they entered the apartment.

There is little need of carrying the story further. I have accomplished what I set out to do. I have demonstrated that the automobiles in the city's service are to a large measure treated as the private property of officials. There are exceptions, of course, even as there are other chauffeurs who can tell of "duty" similar to mine.

Prevalence of the Graft.

I often hear of "joy riding" and I could recite tales of trips by others that are more unbelievable than any experience of my own that I have recounted. I know of one case of a city official taking in a city's automobile a man friend and two women to a summer residence of one of his relatives after the latter had returned to the city and staying there two days and nights, the car being kept in the barn while the chauffeur occupied a servant's room and the whole party lived on the contents of a generously supplied hamper that they had brought with them. Trips to the race track and to distant places are the rule rather than the exception, when baseball or football games are to be played by college teams. In fact, excursions to places where the official would not be willing to spend the amount necessary for the railroad fare, are constantly indulged in at the taxpayers' expense, until the whole question is a shame and scandal which will some day find a place in the daily press to the extreme discomfiture of a number of office holders. It may be that an exposé will even attract the official attention of a county prosecutor or district attorney.

From time to time one reads in the papers of some city official being arrested for speeding in a state in which he can have no official business. There are frequent reports of accidents when returning from race track or ball games, and these are but the surface evidences of a condition that is deep rooted. They may be the straws which show the direction of the wind, but by their frequency they may become the outward and visible signs which will lead to an examination that will disclose the thousands and tens, if not hundreds, of thousands of dollars which this modern form of graft is adding to the taxpayers' burden and which will bring to an abrupt termination a species of malfeasance in office that may be found to have been provided for by a section of the penal code.

Theoretically, and in the hands of a conscientious man, the municipally owned motor car in the service of a public official is an instrument which adds to his efficiency. Practically, it is a premium for the pursuit of pleasure which is equivalent to saying, a premium for neglect of the duty for which, as a rule, the official is too well paid.

Analyses of Cylinder Incrustation.

Considerable interest has been aroused abroad over the matter of cylinder incrustation as a result of the several analyses which have been made. One enthusiast has even gone so far as to advertise broadcast for samples taken from cylinders, which have been working under known conditions, promising to have them analyzed, hoping by this means to get at the subject in a broader way than would be possible by studying such conditions as might come under his own observations. In this connection, it is interesting to note that a new constituent of this rather peculiar substance has just been discovered in the shape of copper oxide.

Like the silicates, the discovery of which a year or so ago, caused no little discussion, it is difficult at first to see how copper can find its way into the cylinder. A little reflection, however, is sufficient to suggest that it is due in all probability to the abrasion of the carburetter throttle—this being the only copper or brass part which is in direct line of intercourse with the interior of the cylinder. A second and more remote possibility is, that due to neglect of the precaution of cleaning out the engine base, a certain amount of wear from the crank shaft bearings might have become mingled with the lubricant to such a thorough degree as to be carried up into the combustion chamber with the oil. The sample under analysis was taken from a two-cylinder engine by the investigator in question, who does not attempt to explain the presence of the copper:

"Sample 'Front,'" as he explains, "was taken from the front cylinder of a two-cylinder engine, and it was believed that this front cylinder had been often over-lubricated. Sample 'Back' was taken from the back cylinder, which was believed to have been generally under-lubricated:

	Front Per cent.	Back Per cent.
Oil (extracted with ether)....	22.73	12.73
Loss on ignition (mainly carbon)	64.46	71.65
Ferric oxide (Fe_2O_3)	7.19	9.51
Insoluble residue	1.30	2.44
Lime (CaO)	0.35	0.65
Copper oxide (CuO)	3.69	2.73

Big Increase in British Registration.

A gross increase in motor vehicle registrations amounting to 25,573, was recorded in the United Kingdom last year, the grand total of motor cars, both of commercial and pleasure types, together with motor cycles, amounting to no less than 119,618. The number of touring cars now registered is 61,617, while commercial vehicles are numbered to the extent of 4,124. These figures represent gains of 15,917 and 1,425, respectively, over the corresponding returns of 1906. The total number of driving licenses is now 205,606, or 38,041 more than the enrollment at the beginning of last year. Licenses awarded to owners of motorcycles, now number 53,877, as against 45,645 one year ago.

Making Damaged Bolts Available.

By filing several V-shaped grooves in the nut, it is often possible to straighten out the threads of a damaged bolt sufficiently well so that it will serve a very useful purpose. If the nut be of steel, it may even be hardened by heating it to a cherry red color and quickly immersing it in water. In the case of a damaged nut, it is possible to effect a similar repair by filing V-grooves in the bolt, and using it as a tap. In either case, care should be taken to follow the old threads as closely as possible. If the end of the thread is badly damaged it may be cut away by means of a file leaving merely the roots of the old thread as a guide for the extemporized "chaser."

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

PAGEANTRY AT PROVIDENCE SHOW

Military Review an Incident of the Opening—Many Cars Staged and a Long List of Exhibitors.

Last Saturday night, 1st inst., was a red letter night for Providence, R. I. Three important events occurred—the opening of the automobile show, a review of more than 300 national guardsmen by Lieutenant-Governor Watrous, and the opening of the new State armory on Cranston street. They took place simultaneously and at the same location, as the armory building was "christened" with the annual automobile show and a military review, the exhibition being under the auspices of the Rhode Island National Guard, with the help of the local dealers.

In view of this pomp the opening was an auspicious one, despite the bad weather. The bright uniforms of the soldiers and sailors, and the feminine fluffy-rufflery heightened the beauty of the show decorations. After the show had officially opened the review of guardsmen took place in the drill hall in the basement.

The decorations were pleasing and novel as well. As the military authorities would not permit a single nail to be driven into the floor, the matter of arranging the decorations and dividing the booths became complex for a time. Both the balconies are covered with a buff and blue-striped bunting, hung from the railing, while back of this, on the walls, are paintings and American flags. With the exception of the aisles the floor is covered with green carpet edged with deep red, and the spaces are separated in the same manner, with a strip of red. Suspended from the beams overhead is a vertical border of the same material, divided into sections by loops every dozen feet. There are plenty of flags of every nation. Palms divide the room into sections for the various exhibits, which are:

American Locomotive Automobile Co., Berliet cars; Crane Automobile and Garage Co., Atlas; Davis Automobile Co., Peerless, Thomas, Winton, Oldsmobile, Locomobile, Buick and Cadillac; Arthur S. Lee, Corbin and Royal Tourist; Pugh Brothers, Elmore; Providence Motor Car Co., Ford; Dauer Automobile Co., Franklin; Crown Motor Car Co., Glide and Kiblinger; Aetna Bottle and Stopper Co., Grout and Maxwell; C. M. Linton, Jackson and Welch; American Motor Car Sales Co., American, Marion and Overland; Frank E. Wing, Marmon; William A. Harris Steam Engine Co., Mitchell; Edgewood Automobile Co., Northern; Flint Motor Car Co., Packard; Foss-Hughes Motor Car Co., Pierce Arrow and Knox; J. O'Donnell, Premier; William Hughes Co., Reo; Nock Automobile Co., Stoddard-Dayton; Snow Automobile Co., Stevens-Duryea; Pawtucket Automobile Co., Studebaker; Central Automobile Exchange, White and Stanley; Whitten Motor Vehicle Co., Rambler.

The Villers Co., optical supplies; Thompson Art Co.; Belcher Loomis Hardware Co., engine supplies; The Angier Co., accessories; Aspinwall Hardware Co., marine supplies; William A. Harris Steam Engine Co., engines; Waite Auto Supply Co., accessories; B. S. Clark, portable houses; Post & Lester Co., accessories; A. W. Harris Oil Co., lubricants; Blanding & Blanding, Foss-Hughes Motor Car Co., commercial vehicles; John A. Gammons; Nonpareil Brass Co., accessories; Visor Knitting Co.; Combination Ladder Co., automobile chemical engine and accessories; J. B. Draper Co., robes; Vaccum Oil Co., Mobil oils; Eutaw Supply Co., accessories; American Locomotive Automobile Co., commercial vehicles; Walter R. Harris, marine engines; Century Optical Co., goggles; B. A. Swenson, motorcycles; L. F. Pease Co., tents; Ira N. Peck, ball bearing tires.

Hillhouse Case Settled at Last.

An automobile upon which the duty already has been paid cannot again be taxed the full value upon its re-entry into this country, even though extensive repairs have been made while abroad. In the hard fought case of J. T. B. Hillhouse, acting for Mrs. Collis P. Huntington, the United States Supreme Court on Monday denied the Government's application for a writ of certiorari, deciding that cars brought back to America after being extensively repaired can be appraised only for the new parts and not as a unit, as contended by the New York customs officials. The rate of duty is set at 45 per cent. The refusal of the Supreme Court to consider the case also has had the effect of affirming the lower courts in holding that an automobile's use abroad for one year need not be consecutive. In other words, two periods aggregating more than one year will entitle a machine to free entry, according to the interpretaiotn of William J. Webster, one of the attorneys.

To Lubricate Enclosed Mechanism.

Sometimes such of the enclosed mechanism of the car as the drive shafts, rear axles, and clutch shafts, are provided only with small holes closed by pipe plugs through which the lubricant must be injected at rare intervals, these openings being so small and so inconveniently located that it is extremely difficult to force grease into them by means of "gun," because of the small area of the channel through which it must pass. A good tip for accomplishing this object, is to screw into the hole temporarily an ordinary compression grease cup by means of which a full charge of lubricant may be inserted with absolute certainty of its finding its way to the very bottom of the cavity. This method frequently may be employed where it would be impossible to use the ordinary gun.

KANSAS CITY SHOW ALL AMERICAN

With Foreign Cars Barred the Display Still is Large and Attractive—Typical Decoration of the Hall.

Kansas City is a typical American city—a place of American people, American cattle and American ideas. This week, in Convention Hall, a thoroughly American show is taking place.

American cars only are displayed, the reason for that being that the Kansas City Automobile Dealers' Association is so impregnated with patriotism that it passed a resolution that cars of American manufacture only would be allowed on the Convention Hall floor, which explains why several dealers who handle foreign cars in Kansas are holding shows in their own salesrooms.

The show opened on Monday night, 3d inst., and will continue until Saturday night. The decorative scheme carries out the idea that the show is distinctly American and decidedly Southwestern, the latter idea being exemplified in the depiction of the great State seals of Missouri, Kansas, Nebraska and Oklahoma. In the effort at localization road scenes in and around Kansas City are much in evidence. The Missouri spirit, "you've got to show me if American goods are good enough for the American people" predominates. The exhibitors are:

Buick Automobile Co., Buick; Central Auto and Livery Co., Thomas; Fletcher Cowherd, Jr. Auto Co., Royal Tourist, Corbin, Stanley and Rauch & Lang; Deere Plow Co., Moline; Dempster Machine Co., Locomobile; Ettwein Motor Car Co., Stoddard-Dayton and Welch; Holcker-Elberg Carriage and Rubber Co., tops, bodies and wind shields; Jackson Motor Co., Jackson; Kaw Valley Auto Co., Mitchell, Premier and Mason; Maxwell-Briscoe Automobile Co., Maxwell; Midland Motor Co., Peerless, Pope-Hartford and Pope-Waverly; Missouri Valley Automobile Co., White and Reo; E. P. Moriarity Co., Packard, Stevens-Duryea and Woods; Palace Automobile Co., Pierce, Oldsmobile and Franklin; Rambler Automobile Co., Rambler; Richter Bros., Moon; Studebaker Bros. Mfg. Co., Studebaker; Baltimore Auto and Livery Co., Pullman; Cowle Electric Co., accessories; Diamond Rubber Co., Diamond tires; Ettwein Motor Co., Auburn; Fidelity Oil Co., lubricants; B. F. Goodrich Co., tires; Kansas City Automobile Jack Co., automobile jacks; Loeffler-Avery Co.; Mercantile Lumber and Supply Co., tires; Morgan & Wright, tires; Moriarity Co., accessories; Schacht Mfg. Co., motor buggies; Sellers Cycle Co., motorcycles; Sprague Umbrella Co., fronts and tops; J. H. Wittman, accessories; Wagner Motorcycle Co., motorcycles; Factory Sales Corporation, accessories; S. F. Bowser & Co., Inc., gasolene starage outfits; Fisk Rubber Co., tires.

FROELICH LETS HIS TONGUE WAG

"Bargain Dispenser" Airs His Views of Chauffeurs and Other Things and Makes Terrifying Threats.

When, on Friday morning, 7th inst., the last issue of the Motor World reached that part of New York City occupied by the second-hand cut price emporium doing business as the Times Square Automobile Co., there was evidence of agitation quickly followed by a rush to the telephone. Connection with the Motor World speedily was obtained and a man who said his name was Froelich heralded his presence at the Times Square end of the 'phone—four or five miles away.

Froelich announced that he had read the simple little story of the chauffeur who asserted that he had found his stolen accumulator in the Times Square establishment. Of course, Froelich never reads the Motor World! He never would have known of the story had not a friend happened in with a copy of the paper! Froelich's voice betrayed his agitation. He demanded that the man at the other end of the wire drop all business forthwith—that he "get busy, and get busy quick."

"You want to see us, and see us in a hurry," and Froelich laid strong emphasis on the word "see."

The man downtown appeared not to appreciate the Froelich idea of "seeing" or of "getting busy quick."

"What's the matter with the story?"

"It's false from beginning to end. It says that we are receivers of stolen goods."

"Does it really say so? Possibly you'd better read it again."

"It's blackmail, that's what it is."

"That's a pretty strong word. We suppose you can prove it if required. Has any one connected with this paper ever tried to blackmail you? Have you ever heard of them trying to blackmail any one else?"

"Well, you never print anything like that about your advertisers."

"Possibly because there never has been occasion for it?"

"Oh! you've got more than one crooked advertiser?"

"Can you name one?"

"Oh! you've got five or six of them. We know them."

"It's news to us. Why not name one? We certainly would like to know who they are."

"Well, we never advertised with you, anyway."

"Did we ever try to get you to do so? Has a man from this office ever even called on you?"

"Maybe he's done so and you don't know it."

"I guess we'd know it all right. But regardless of the fact, if there's anything wrong about the story you can have all the space you want to correct it, or to tell your side of it."

"Why should you print the lies of that dirty, low, dishonest chauffeur? Wridgway knows that fellow and can tell you about him. He's a crook—all chauffeurs are vile crooks and you know it."

"But we don't know it. Can you prove it?"

"Well, there's not five per cent. of them that are not crooks. They are the scum of the earth. That vile creature that told you that story came in here and—"

"Oh! then he did call and see you?"

Between further heated denunciations which probably would give the chauffeur abundant room for legal action of two kinds, Froelich admitted that the chauffeur had called in search of a stolen accumulator, but declared that he (the chauffeur) was several varieties of vile liar—"vile" was a word that seemed readily to roll off of the Froelich tongue—as the accumulator he claimed was not the one that had been stolen, but was one that had been purchased from a reputable man who could be produced.

"Do you know who we are?" asked Froelich, who proceeded to answer his own question. "We are not the Manhattan Storage Co."—a rival "bargain" concern with a history which, like the Times Square company, advertises "We are the largest dealers in the world," and for which he expressed considerable regard. Then he detailed the great volume of business his concern had transacted. It was "away up in the pictures." The Times Square company had bought $40,000 worth of tires from one company and $117,000 from another, and had the receipts to prove it. Froelich meant to write both of them, intimating plainly that he meant to say that if, thereafter, they advertised in the Motor World, he would not buy from them again.

"Isn't that a species of blackmail?" asked the tender voice at the Motor World end of the wire.

"Well, I'll just write them, calling attention to your story," Froelich replied in a suddenly qualifying tone.

But before he got through Froelich let it be known all the other varieties of things he proposed doing to the Motor World. He intended to call down on it the United States government, that is, the postal department; he would see the district attorney; he would sue, sue, sue, and never, never, or hardly ever, let up.

Assured that any and all of those proceedings were within the privileges of every man, he was asked:

"Anything more?"

"Oh! you'll hear from us before the afternoon is over," was his final flourish.

The afternoon came and went—also five other afternoons—but the promised message has not put in an appearance. As, however, it is not the desire of the Motor World to present but one side of a case, Mr. Froelich's story is chronicled substantially as he told it.

The Froelich brothers are the active managers of the Times Square establishment. Previously, they operated in Philadelphia as the Delaware Rubber Co., which enjoyed an interesting career, and an interesting finish. Though gone, it is not, however, wholly forgotten by quite a few persons.

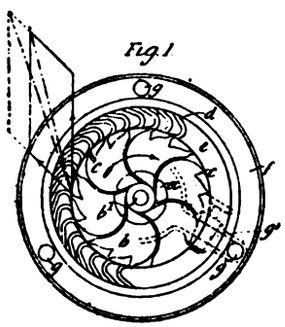
Imports Shrink More Than a Million.

Throughout last year the business of importing foreign cars into America suffered to a material extent. The valuation of the 1,093 cars brought into this country is given as $3,157,168, as compared with the $4,416,048 declared during 1906 as the value of 1,295 cars. The average value per car, based on declared value at ports of entry, has thus fallen from $3,410 in 1906 to $2,946 in 1907. That the markets for cars and component parts of cars are more or less disassociated, is shown by the fact that the $650,000 investment in foreign parts of 1907, was something like $150,000 greater than the corresponding figure of 1906. By way of contrast, it is worthy of note that the American export business for last year was stronger by some $1,950,000 than that of importation during the same period.

France has retained the lead in supplying the American agents with cars, no less than 835 machines having been entered during the year. This is about 100 less cars than were shipped to this country from the same source during 1906, however. The United Kingdom and Italy stand equal on the year's total, with 91 cars apiece, while Germany's contribution amounted to 53 machines. The remaining importations were from scattered sources. Each of the countries named has suffered a depreciation in its exports to America, that of Italy coming next to France. England's trading was only 6 cars less than during 1906.

Shanghai Dealers Handicapped.

"At the present time there are 111 licensed motor cars in use in Shanghai, 75 per cent. of which are of American manufacture, the leading makes being the Oldsmobile, Columbia, Reo and Rambler. The European cars are mostly of French and English make, but there are in addition a few German and one or two Italian cars," writes Consul General Charles Danby, of Shanghai, in a special letter to the American Exporter.



"Local dealers complain that a great drawback to increasing business in the automobile trade is found in the practice of manufacturers, who will quote the prospective individual buyers the same terms and prices that they quote to their regularly appointed agents, and that this is one of the principal reasons why the sale of American made cars is not pushed harder in Shanghai. They feel that if the manufacturers wish their cars sold in Shanghai they should offer some inducement to local dealers to get the business."

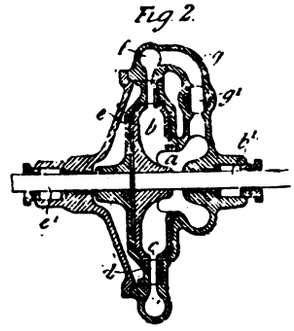
SIMPLICITY IN HYDRAULIC CLUTCH

Turbine Principle Applied with Reversed Employment of Two Essential Parts —The General Arrangement.



In its ideal form, the master clutch of the motor vehicle should be of such a nature as to permit perfectly smooth action at any and all speeds, whether of motor or car, and regardless of load conditions. Because of its nature and purpose, moreover, it should be of the simplest possible construction. It is interesting therefore, to learn that the most recent development along the attractive line of the hydraulic clutch takes the form of the outward flow turbine and comprises but three essential parts. These are the driver, corresponding to the stator of the ordinary turbine, the driven part, corresponding to the rotor of the regular turbine wheel, and a regulating valve, which

controls the passage of the active fluid through the other two portions of the device, thus controlling their relative motion. This remarkably simple conception is the invention of Edmund S. G. Rees, and is being exploited by the Rees Roturbo Development Syndicate, of Wolverhampton, England.

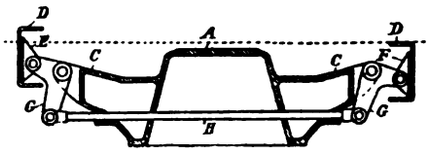
Structurally, the functions of rotor and stator are reversed in this case, the action being exactly opposite to that taking place in the power turbine, and corresponding to that carried out in the turbine pump. The "impeller," as the driving member is called, is of the pressure producing type, and is keyed to the crank shaft of the motor. As rotated, it serves to inject a stream of fluid against the vanes of the turbine wheel, which performs the part of a follower. The two parts are so contrived that the fluid circulates between them, and its passage is controlled by the by-pass valve, the relative speed of the two consequently being variable within wide limits.

The general arrangement is apparent from the two illustrations, which are, respectively, a transverse and longitudinal section. The fluid, which may be oil or glycerine, is admitted to the "eye," a, of the pump element, b, which is keyed on the crank or driving shaft, b1, and has outwardly directed nozzles about its periphery, c. From these, the fluid is discharged at a velocity depending on the speed of the driving shaft, into the vanes or buckets of the turbine wheel, e, the angle of the working surfaces, d, being such as to deprive it of its energy by setting them in motion. The turbine is keyed to the driven or propeller shaft, e1. The discharge from the turbine pesses throug the outlet pipe, f, which communicates with the inlet. The rate of dis-

charge, being controlled by the throttle, g1, of course, regulates the rate of transmission of the fluid, and hence inversely, the speed of the driven shaft. The device is self-contained, free from end thrust and should not prove cumbersome.

Napier Goes in for Motor Cabs.

There is no part of the world where the manufacture of motor cars has attained any considerable proportions that is not at present infected with the desire to produce low-priced vehicles of the rough-and-ready order suitable for cab service. England is no more behind the times in this respect than Continental Europe, but it is somewhat surprising to find that the Napier Co., which has for several years been such a strong exponant of the six-cylinder principle, has gone in for the construction of a twin cylinder motor cab of the light variety mentioned.



The power plant of this machine is of the unit type, the base supporting the 3¼-inch cylinders, being rigidly bolted to the gear box and the aggregation suspended from three points on the frame. The change speed gear is of the progressive type and affords a direct through drive on the highest gear. Forced water and lubricant circulation also are features of the plant.

An unusual point in the design is the use of wire wheels. Otherwise, however, the mounting follows the lines of ordinary practice, the rear live axle, as well as the front wheels running on ball bearings, and the chassis being suspended on semi-elliptical springs. The wheel base is 96 inches, and a turning radius of 25 feet is made possible by the design of the steering gear. The overall length of the vehicle is 11½ feet, the road clearance is 10 inches, and the height of the frame sills above the ground is 24 inches. The machine is being turned out at the Acton works of the company, and plans are under way for producing it in large quantities.

DESIGNED TO PREVENT "WEAVING"

Suspension Which Counteracts Differential Movement in Sides of the Frame—How the Effect is Secured.

Up to this time the only method of safeguarding the motor from the effects of "weaving" in the chassis frame has been to use some adaptation of the three-point suspension principle. This system, while largely used, does not always lend itself perfectly well to the design of the machine in other respects, and also may be open to question somewhat when it comes to the point of absolute stability upder heavy vibration stresses. On this account the new motor suspension designed by F. H. Royce, inventor of the English Rolls-Royce car, is more or less interesting. It provides for a certain limited amount of differential movement between the two side members of the frame without in the least affecting the position of the motor. The effect is secured by adding to the usual sup-

porting brackets, a linkage consisting of two bell crank levers and a tie rod.

As will be seen from the illustration, the crank case and engine bed, A, is hung from the two frame members, D-D, by means of the two arms, C-C, as is ordinarily the case. The arms, however, instead of being attached directly to it, are connected by means of the horizontal arms of the two bell cranks, G-G, the lower extremities of which are connected together by the distance tie rod, H. It will be seen that as a result of this any tendency to elevate one side of the motor is compensated by a corresponding tendency to elevate the other side while lowering the first with relation to the frame, the linkage being so contrived as to bring this about. The arrangement while tending primarily to relieve the motor of unnecessary stresses also serves to distribute the vibration and torque thrusts upon the frame and so acts in a dual capacity.

Prussia Plans a Testing Laboratory.

A state automobile testing laboratory suitable for carrying out all sorts of experiments relating to the advancement of motor traction, is soon to be established at the Technische Hochschule in Berlin. In his budget for 1908, the Prussian Minister of Education includes the sum of $7,500 for the establishment of such a department. The money will be spent in adapting and perfecting the equipment of the laboratory already existing at the school.

COMPRESSED AIR AS AN AUXILIARY

Utilized for Alternate Power as Well as for Starting—Novel "Mixed" Cycle in an Ingenious System.

Several methods are in vogue whereby compressed air is made use of in starting the internal combustion motor which is used to drive the car, and in several instances it has been proposed to extend the principle in such a way as to provide in the compressed air an auxiliary to the motor sufficiently powerful to be used for starting the car as well as the motor, or for assisting the latter when overloaded. So far as

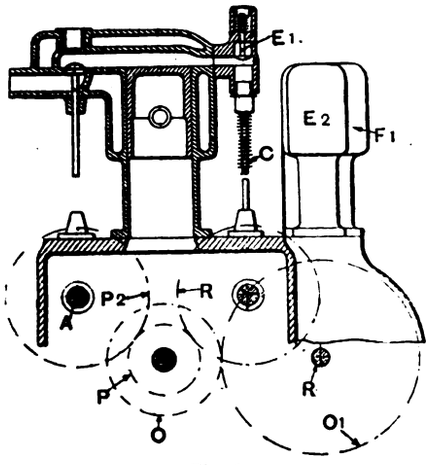

Fig. 1

is known, none of the latter type ever have come into current useage. The apparent feasibility of the idea is so appealing, however, that it is not surprising to learn that it continues to lure inventors. The most recent development of it is found in the new six-cylinder Berliet "Marche-Mixte" motor, which is known as one of the "novelties" of the present winter by the French motoring publications.

Basically it consists of an ordinary sextuple motor with twin cast cylinders having the ordinary valves mounted on one side and actuated from a single cam shaft in a perfectly regular manner. Mounted on the opposite side and at the rear, is a two-cylinder, two-stage, double-acting air-compressor which is capable of supplying air to a charging reservoir at a pressure of 1,400 pounds per square inch, or thereabouts. Leads from this connect with a manifold running along the tops of the gas cylinders on the left side of the engine, the connections being made by means of siamesed ports cast in special valve chests which are bolted to the cylinders.

The general arrangement is shown in the accompanying illustrations in which Fig. 1, is an end elevation of the motor, looking toward the rear and showing the compressor cylinders, E2 and F1, which are necessarily of different diameters. The gears, O-O1, drive the compressor at half the speed of the crank shaft, while the group, P-P2-R, operate the cam shaft, A, and the valves, C, employed to actuate the auxiliary valve-gear. The arrangement of this system is shown in Fig. 2, in which it is apparent that the chamber, F, serves to distribute the air to the two cylinders of the group through the action of the main valves, C, which are worked from the cam shafts, D, below, and the check valves, E-E, which serve in the capacity of automatic inlets to the ports, H-H, leading to the cylinder interiors. The valves, C, serve merely for purposes of timing, and admit the air through the ports, G-G, to the secondary and automatic valves below.

The cam shaft, D, is made to be displaced longitudinally, in order to throw its cams, N-N-N-N, into and out of action according to its position, thus controlling the use of the air in the cylinders. An extention of the cam shaft beyond the driving gear, is fitted with a piston, K, riding in the cylinder, J, and is held normally to the left, or in the out-of-gear position, by the spring, L. Whenever air is admitted to the chambers, F, it is by-passed to the pipe, M, thus serving to force the piston, K, over sufficiently to operate the cam lifters and the valves, C. In this way the air system is thrown into and out of operation by manipulating the air-throttling pedal.

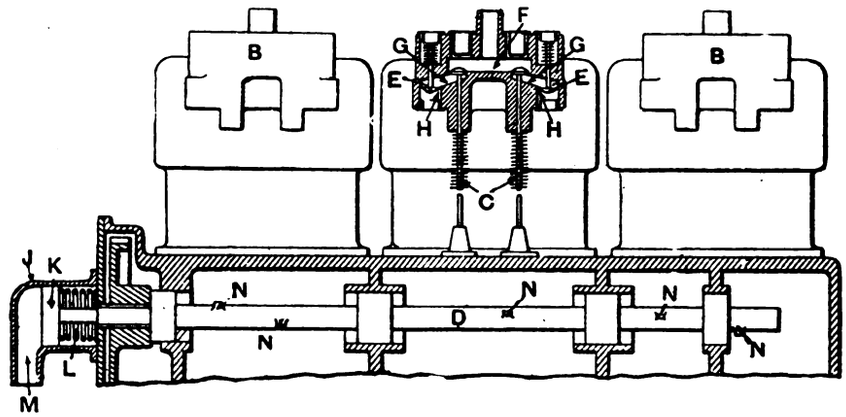

Fig. 2

In starting the car from rest, it is necessary merely to admit air to the cylinders by way of the auxiliary valve chests, F, when the pistons are put in motion by the combined thrust and expansion of the air. The air valves are made to open only during the third or working stroke of the cycle, so that the action of the regular valves need not be interferred with in the least. When the carburetter throttle is opened, the suction stroke draws in gas in the usual way, and the regular cycle is taken up without further manipulation.

If the air throttle is held open after the regular operation of the motor has commenced, the effect is to increase the mean effective pressure of the working stroke owing to the pressure of the air at the beginning of the stroke, and its expansion during the interval prior to the release of the exhaust. The heat of the burning gas effects a "regeneration" of the compressed air, which is required to pull up the efficiency of the air cycle, and naturally, the presence of an extra amount of pure air in the cylinder has no deleterious effect on the burning of the gas, so long as the mixture has been formed properly and compressed in a homogeneous state, as is claimed.

For starting under air pressure, the reservoir pressure of 1,400 pounds per square inch is reduced to somewhere between 40 and 50 pounds, while for running on air alone, as may be done when slow speeds are required, a pressure of from 100 to 140 pounds is used. During the operation of the motor as a "mixed" air and gas engine, the intitial air pressure must be raised to something above that of the explosion, which is easily done with the high receiver pressure carried. The advantages claimed for the system are: automatic starting of the motor, simultaneous starting of the motor and the car, propulsion by compressed air alone, propulsion by internal combustion alone, propulsion by the "mixed" system, instantaneous engine braking, and instantaneous engine reverse.

The braking effect is secured by permitting the car to drive the air compressor through the motor, when both gas and air are shut off, while the reversal may be accomplished by means of the air alone. Obviously, with such an arrangement, the need of the usual clutch and change gears is reduced to a small and merely nominal capacity.

Kerosene for Removing Rusty Nut.

It seldom happens that a nut which is "rusted" in place cannot be removed if soaked for a sufficient length of time in kerosene oil. It is often difficult to apply the oil in such a way that it will reach the roots of the thread, however, and frequently the rust remains untouched even after a long period of treatment, on this account. A good way of insuring its proper distribution is to bind a thread of cotton waste about the affected part and saturate it with oil. When this has been done it is possible to keep the rust in a moistened condition for as long a period as may be required to loosen it.

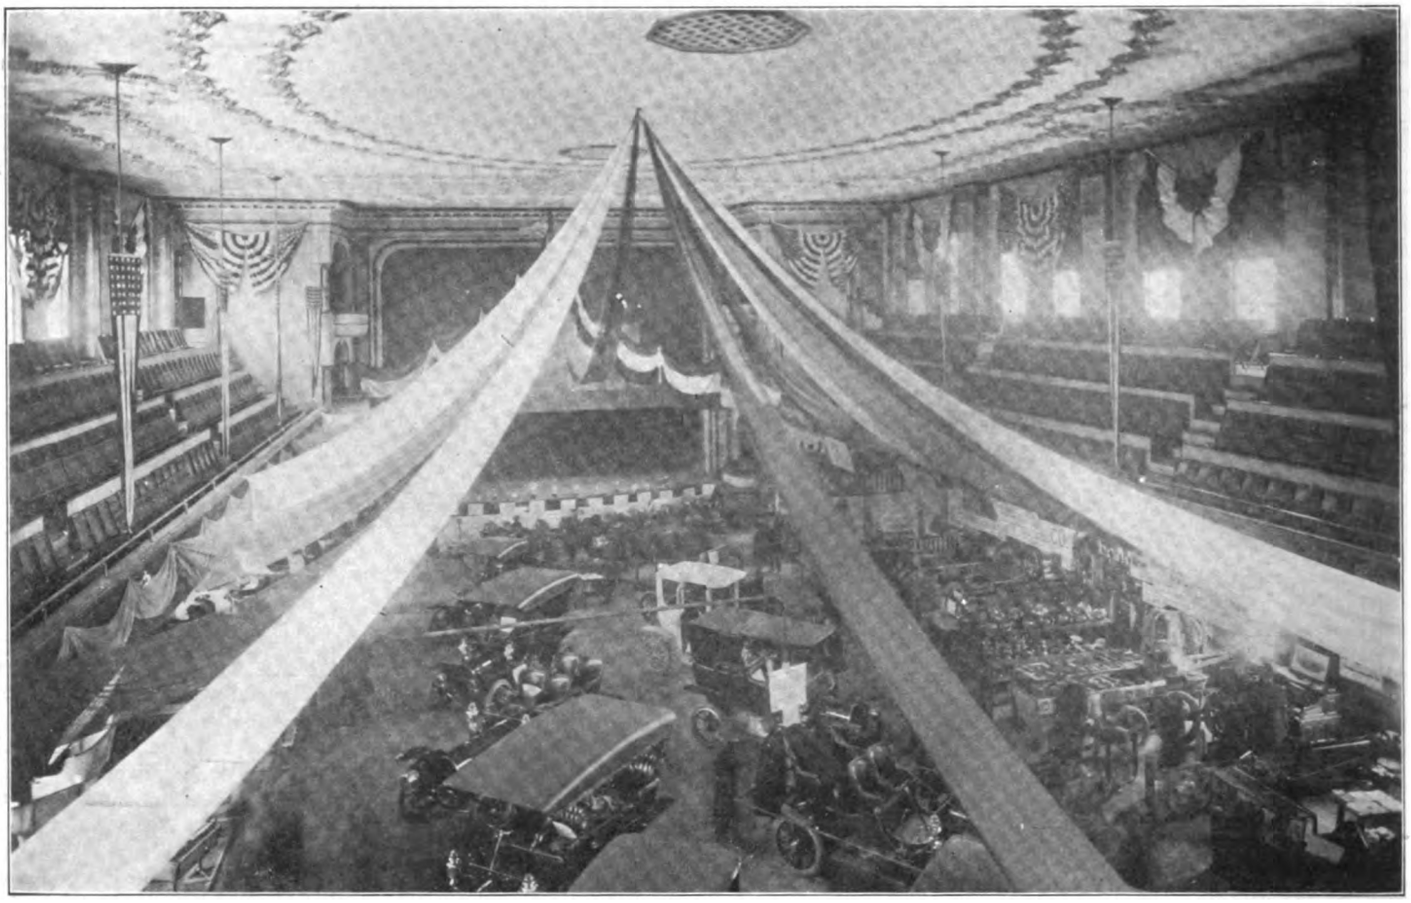
FRANKLIN SHOW AN OBJECT LESSON

Cars, Materials and Processes Included in the Exhibition—Interesting Tests Given with Ingenious Devices.

For originality of conception, thoroughness of execution and in itself an idea of real value to every one interested in automobiles, it is doubtful if there has ever been a more effective demonstration than that given last week by the H. H. Franklin Mfg. Co., of Syracuse, N. Y. In brief, it was a "Franklin Show"; the Alhambra, the largest local hall being hired for the purpose. Within its walls was a display of Franklin cars of every style and kind and in addition, exhibits of practically everything that enters into their construction; the processes by which everything from the raw steel to the finished car is selected and tested and parts in bewildering confusion shown in all stages of completion.

Several demonstrating devices also formed part of the show. Quite the most ingenious was one designed to test the Franklin principle of light weight. It was a toboggan sort of an affair with two runways. Two miniature machines, one a Franklin, the other designed to resemble a water-cooled car of the same power and whose weight was figured out in corresponding relation, were placed at the foot of the runways. To the front axle of each was attached a string leading to the top of the structure and to the ends of which were attached weights of equal size. These weights, evenly released, caused the machines to start to mount the grade, and while it could be seen that both started evenly, the Franklin, of course, shot away from its competitor in impressive style. To show that there was no deception regarding the matter the machines were transferred, as were likewise the weights, and upon request each were weighed and the comparison proven. It was a most interesting experiment and one that the company intends to have placed in all of their branch houses, where the doubting Thomases can dissect it to their heart's content.



Another interesting demonstration was a Franklin car, each wheel of which was placed upon separate scales, the total proving the advertised weight and showing its distribution.

The large stage itself was transformed into a lecture room with a platform mounted on one end. On this platform was a large stereopticon upon which were thrown large sized pictures showing the development of the automobile as a vehicle, a lecturer reciting its history and many interesting facts concerning it. Later, was shown the beginning of the Franklin company, its progress, with picture after picture of the new factory and its various impressive completion. The stage, of course, was darkened by the dropping of the curtain and the lecture itself was of interest.

Admission to the building, to the lecture and everything else was free and that it was appreciated was proven by the fact that on Thursday, the opening day, the attendance was estimated at about 6,000.

Incidentally the only thing within the hall not a part of the H. H. Franklin Mfg. Co. was a tea booth, presided over by several ladies, the proceeds of which were devoted to a local charity.

From this new form of publicity it would appear that sales manager V. E. Minich is bringing to bear some of the methods of the National Cash Register Co., with which he was long connected.

GENERAL VIEW OF THE STANLEY SHOW IN ALHAMBRA HALL, SYRACUSE

The Horn for the Dilemma.

When it is absolutely necessary to have a funnel, in the event of a roadside "panne" where none of the regular sort is available, it is a trick requiring but a moment's time to remove the horn from the car, disconnect it, and take out the reed, after which, it will be found to serve the purpose very well indeed. In many instances, it will be more useful than the rolled-up paper cornucopia which is usually suggested at such times.

HINTING AT HEAVIER TAXATION

State Engineer Skene Claims that Automobiles Increase Road Expense—What He Says in Annual Report.

Taxation of automobiles is likely to be one of the most thoroughly discussed topics before the New York State legislature during the current session. Of course the outcome is problematical, and it may be that the scheme of graded taxation proposed by the New York State Automobile Association will be adopted only so far as the matter of gradation is concerned, and with heavier rates. That such a probability is a strong one is indicated in the annual report of Frederick Skene, State engineer and surveyor.

"I deem it my duty," Mr. Skene says, "to call your attention to the injurious effect of rapidly driven power vehicles upon the public highways of this State, especially those of macadam surface. The question cannot longer be ignored." He says further:

"Ten years ago the Higbie-Armstrong bill became a law, as the first notable effort of the State to break away from the antiquated methods in vogue during the previous century and give to its citizens well built and permanent highways in return for the money expended on their construction. This law was not placed upon the statute books without a 20 years' struggle of the few advocates of improved highways, led by the League of American Wheelmen, then a strongly organized body of users of roads.

"The natural reluctance of the people to try expensive experiments and to make costly innovations—although the success of macadam roads had been proved in adjoining States—made necessary a long campaign of education before the law could be passed. The leading argument was that the farmers would be better provided for in marketing their crops. To this end they were permitted by the law to petition for a section of highway to be built in front of their holdings and were assessed according to their benefits, or practically according to their frontage, in partial payment therefor. At that period the use of the highways by automobiles to any considerable extent was neither foreseen nor considered.

"It is only within the last two or three years that the remarkable increase in the number of automobiles as well as in their weight and speed has made noticeable their effect upon the public highways. This damage appears to be caused in two ways —first, by the so-called suction of the broad rubber tire of a swiftly moving wheel upon the finely comminuted material of the wearing surface and binder, causing it to be displaced and thrown out to the rear, thus exposing the jagged corners of the top course of macadam, which are in their turn reduced to fragments and removed from place by the same agency; and, second, by the direct picking action of numerous devices now used to roughen the surface of the tire, and thus obtain a stronger hold upon the smooth surface of the finished road; by the use of chains and other appliances, termed in general non-skidding devices and intended to prevent side-slip of the wheels, especially in wet weather, or at high speed, or at turns in the road.

"It is to be observed that speed is an essential element in causing the injury in both the cases named. The higher the speed of the machine the greater is the injury inflicted. The law now permits no greater speed than 20 miles an hour upon the open highways of the State, yet it is a matter of common knowledge that this law is "more honored in the breach than the observance."

Raiding Unattended Automobiles.

Raids on cars left standing in the streets of New York City were begun under direction of the street cleaning department on the evening of January 22. The first onslaught was made from Station B in West Fifty-second street, under the lead of District Superintendent Denice, who rode in a buggy. A truck also was included in the raiding equipment.

The first capture was a car owned by the Automobile School of America. It was found "derelict" at Forty-ninth street and Seventh avenue. The detachment was halted, the truck was backed to the automobile, the two vehicles were connected and the chauffeur who accompanied the raiders took his place at the wheel of the car. The march to the encumbrance yard at West Fifty-sixth street was begun despite the protests of a man representing the school, and the procession was accompanied by the usual crowd.

The raiding party did not interfere with private automobiles nor with those standing in the streets before the salesrooms of agents. Visits were made, however, at each of the garages, which previously had been notified that it is a violation of a city ordinance to leave an automobile in the street unattended for a longer period than fifteen minutes. According to Deputy Street Cleaning Commissioner Edwards, even the car of a physician thus left is liable to seizure.

Plan to Raise Funds for Sign Boards.

Dealers in San Francisco have hit upon a new plan to raise money to carry on the signboard work in that section of California. The scheme is to interest owners of automobiles to the extent of giving up the pleasure of riding one day during the next season and pay the cost of gasolene and oil for a 100 miles trip. The idea is to run the cars around the bay and charge $5 per person for the trip. If a majority of owners offer their cars for the purpose something like $30.000 can be raised.

AUTOMOBILIST IN FELON'S CELL

Severe Sentence for Newark Dentist Whose Recklessness Cost a Life—Stern Warning for Others.

For the first time in this country, an automobilist who had caused a fatal accident and who, lacking the courage to face the consequences, had hurried away, leaving his victim to his fate, has been given exemplary punishment. Dr. Walter H. Morris, a dentist of Newark, N. J., is the man concerned. He will have 18 months in the Essex county penitentiary in which to reflect on the results of his folly and inhumanity.

Morris caused the death of Marcus J. Jacobs, a theatrical manager, by running him down on Broad street, in Newark, on September 26, 1907. Some time after pleading "not guilty" to an indictment charging him with manslaughter, Morris withdrew his plea and pleaded "non vult." When arraigned before Judge Ten Eyck for sentence on the 29th ult., his counsel, Samuel Kalisch, made an appeal for clemency, which was met by the request of Public Prosecutor Young for the imposition of a sentence sufficiently severe to act as a deterrent upon automobilists addicted to reckless driving. In acceding to the prosecutor's request Judge Ten Eyck made it plainly evident that, while accepting the defendant's disclaimer of criminal intent, he regarded his conduct in the matter as of a criminal character.

"After drinking intoxicating liquors with your companions," he said, "you drove your high powered automobile at great speed through Broad street, in the center of the city, at about 4.30 p. m., when the street was crowded with people. Mr. Jacobs had just stepped off a trolley car and was about to go to the sidewalk when your machine struck him with great force, while you were going at high speed, and without giving any warning signal. You knew he had been struck and probably seriously injured, but continued at high speed down Broad street and out of the city, doing further damage later on.

"It was not until several days later that you concluded to surrender yourself to the public authorities. Such conduct was not only the extreme of disregard for the safety of others, and a cowardly violation of common decency, but your recklessness supplied the place of the civil or criminal intent required to constitute a criminal act, and makes you responsible under the criminal law for manslaughter. Both as a punishment to you and a warning to others using the highways that gross recklessness resulting in injury to others will be adequately punished it is the duty of the court to impose a severe penalty in this case.

"The sentence of the court is that you be

Digitized by Google

confined for the term of eighteen months in the Essex county penitentiary and from thence until the costs are paid."

His plea of "non vult" deprives Morris of the right to appeal from this sentence. In addition to serving his time in prison he has to answer in a civil suit for $100,000 damages, brought by the administrators of the Jacobs estate, and in another for $5,000 damages, brought by Louis Shapiro, whose peddler's wagon his car demolished during his flight from the scene of the more tragic accident.

Enormous Penalties Proposed.

Of the many automobile measures placed before the Massachusetts legislature to be considered during the present session the more important, including those bills that are likely to receive favorable consideration, have been outlined in the Motor World. Among the others there are some that, even in Massachusetts, have about as much chance as a snowball would have in a place where the fuel supply is said to be inexhaustible. Some of them are worthy of mention for no other reason than their extreme absurdity.

One bill of this sort is evidently the production of a mind dominated by a rabid form of motorphobia. It provides that a motorist may be fined $1,000 and imprisoned for twelve months on conviction of injuring a person or a corporation; the fine is increased to $3,000 and the term of imprisonment to three years for gross negligence; and for causing loss of life the fine is made $10,000, with imprisonment for ten years. The same bill provides a fine of $1,000, with one year's imprisonment for not keeping to the left in passing a carriage going in the same direction! The bill has been referred to the committee on roads and bridges, where it is believed to be as safe as if in the hands of a committee on the legislative morgue, if such a committee were in existence.

The bill proposing to give to the selectmen of Nantucket the power to exclude automobiles from the island by closing roadways in the town, without possibility of interference by the State highway commission, probably has got as far as it will go. There is some surprise that it was passed by the House of Representatives, and no expectation that it will get through the Senate. That it is special legislation is not more apparent than that it would open the way for taking the automobile question out of the hands of the legislature and placing it at the disposition of the various city councils and town boards to settle as each might see fit. If Nantucket should be granted what the selectmen have sought to obtain through this bill there are other old fogy towns that would bob up with their "me too!" Even if every city and town should not ask for such legislation, there would be a sufficient number to destroy the uniformity of automobile regulations in Massachusetts.

DANGER IN THE FORCE OF HABIT

Experience of a Motorist Who Suddenly Switched Types of Transmission—How He "Put His Foot in it."

They were sitting in a corner of the club room and tales of personal experiences served to kill time:

"Did you ever switch suddenly from your sliding gear type and try to drive a car equipped with a planetary transmission?" asked one of the old timers, who was himself a driver and not dependent on the professional chauffeur.

Receiving no reply, he continued, "I did. I tried it, with disastrous results. The incident made so decided an impression on me that I remember the slightest detail.

"I was sitting just about where I am now one day a year ago, when I was summoned to the phone, an intimate friend was on the other end of the wire, and he unfolded a terrible tale about being swindled in the purchase of a new car, had had a lot of trouble with it the day before, and finally in the late hours of the night had left it in a barn on the outskirts of the city and was very anxious for me to look it over before some dishonest employe of the manufacturer got a chance to make a temporary repair and then prove the car was all right. My friend couldn't go with me, he said, as he was subpoenaed in court.

"I consented readily enough and an hour later was beside the car. I found there was nothing worse than a loose battery connection, which had, of course, caused irregular firing, and having tightened this, I soon had the engine turning over.

"As he and I stabled in the same garage I thought I might as well run the thing home for him. I got into the seat and though, of course, I knew it was a planetary I unthinkingly pushed the left pedal, with the involuntary impulse we have before releasing the emergency brake, and the car began to back up. I had my wits about me in a moment and realized, after I had given one of two more pressures with the intention of getting the clutch out, that there was no clutch, and if I didn't get off that pedal quick there would be 'something doin'.' I released it only to find that the release spring was broken and I would have to kick it off. Well, that was easy, and I had control before anything happened.

"My trip downtown was without incident. There were many awkward moments when I reached the busy streets, but I finally arrived safely at the garage and drove in.

"There was a little manoeuvering necessary to get into the right space, and my left foot, which I had kept religiously under me, sitting on it lest it remembered its habits and sought to monkey with the clutch which wasn't there, was again put in commission. I backed as far as I wanted to, then released the pedal, but the broken spring got in its fine work and I kept on backing.

"The necessity of doing something, and doing it quick, was responsible for the return of the involuntary motion of pushing the left pedal, and as I did this I crashed into the glass door and framework of the office, doing about $10 worth of damage to glass, woodwork and fixtures; with the crash I pushed harder than ever, and fortunately, I stalled the motor."

"Supposing the motor hadn't stalled?" queried a young man who rode only when his chauffeur permitted him to.

"Well," responded the other, "I would have definitely settled the problem that has puzled science for many generations as to what happens 'when an irresistible force meets an immovable body,'" and the speaker motioned for the waiter with a comprehensive gesture.

How the Chauffeur Cleaned the Coat.

A well known New Yorker, whose prominence and enthusiasm as an automobilist makes him a conspicuous figure in the news items of the daily press, recently bought an imported rain coat of fine texture and light color.

He had used but a few days when one rainy morning, while wearing it he sought to satisfy his curiosity concerning the queer actions of his car by a personal observation of some of its interior mechanism with the result that a large, generous application of grease was apparent on the new coat.

Arriving at the office he handed the coat to his chauffeur with orders to clean it.

The chauffeur, however, was without experience in this line of work, but knowing that gasolene was used to remove oil and grease from engines he figured it would do equally well in this case and placing the garment in a large basin, covered it with gasolene and went to dinner.

Returning about an hour later he rubbed out the spot and grasping the coat by its sleeve lifted it from the pan only to find that the glue used in the seams had dissolved and the rain coat was in pieces. He hung these on nails side by side and awaited developments.

A day or two later the owner in passing through the garage observed the decoration. With quick comprehension he realized what had happened and that his rain coat was no more. There was no word of reproof. In half sorrowful tones he remarked, "Well, there's thirty dollars more gone to the devil," and the incident was closed.

Motor Postal Delivery on Large Scale.

Motor postal delivery on a large scale is being planned in Nuremberg, where no less than thirteen mail wagons will be put into service during the coming summer. A city garage and repair shop are already in process of erection, and it is planned to increase the equipment later on as the service demands an extension of facilities.

The Week's Patents.

871,797. Cooling System for Internal Combustion Engines. Gustavus Green, Bexhill, England, assignor of one-fourth to Francis Pelham Clinton Hope and one-fourth to Joseph Miller, Bexhill, county of Sussex, England. Filed Sept. 15, 1905. Serial No. 278,597.

1. In an internal combustion engine the combination with the cylinder of a water jacket, a radiator connected with the same and projecting beyond the surface of said jacket, said radiator comprising sets of adjacent channels for the circulation of the water communicating with the upper and lower parts of the jacket, and confined to the space immediately around the sides of the jacket, and being distributed around the same in such manner as to efficiently utilize the available space round the jacket.

871,807. Rotary Engine. Jay E. Lehman, Canton, Ohio. Filed March 20, 1907. Serial No. 363,359.

1. In a rotary engine, a case, a rotatable cylinder therein, a piston in the cylinder, annular channels having correspondingly varying depths in the end walls of the case, an endwise movable non-rotatable screw in the cylinder having its ends abutting the bottoms of the channels, and means connecting the screw with the piston whereby the piston is operated by the endwise movement of the screw.

871,868. Tire Cleat for Traction Wheels. William Galloway, Waterloo, Iowa, assignor to William Galloway Company, Waterloo, Iowa. Filed Feb. 28, 1907. Serial No. 359,706.

A traction wheel tire cleat, comprising the combination with a tire of cleat members adjustably spaced apart, said cleat members embracing and overlapping the tire tread and having inwardly projecting jaws adapted to be secured about the tire's opposite edges, the overlapping portions of said cleat members having perforations in registration with each other, a bolt adapted to be secured within the said registering perforations and across and over said tire tread, and means for removably and adjustably spacing said cleat members apart and securing them about said tire.

871,881. Rotary Explosive Engine. Adolf Montan and Joseph Seholm, Newark, N. J. Filed June 14, 1907. Serial No. 378,916.

1. A motor comprising a support, a cylinder fixed thereon, pistons operating in the opposite ends of the cylinder, a rotatable casing mounted on the cylinder and entirely inclosing the same, and means for driving the casing from the pistons.

871,883. Burner for Explosion Engines. Peter McCusker, Galesburg, Ill. Filed May 22, 1907. Serial No. 375,172.

In a burner for explosion engines provided with a heating chamber and an ignition pipe therein, a removable heat reflector adapted to be secured over the open end of the heating chamber, being formed of a single thin plate of resilient metal and consisting of a central hub smaller than the end of the chamber and outward projecting arms bent downward at their ends to clasp the outer sides of the walls of the chamber.

871,886. Reinforced Corner for Vehicle Bodies. David M. Parry and Thomas H. Parry, Indianapolis, Ind., assignors to Parry Manufacturing Company, Indianapolis, Ind., a Corporation of Indiana. Filed Sept. 18, 1906. Serial No. 335,099.

1. In a vehicle corner, a standard notched on its inner side, an end member notched on its outer end to receive the notched end of the standard, a transverse member wider than said end member notched on its inner face at the end to receive the standard and end member flush with its end, and a metal plate covering both of the outer sides of the corner thus formed said plate being continuous from one side to the other around said corner.

871,920. Vehicle Spring. Arthur Falkenhainer, St. Louis, Mo. Filed Dec. 26, 1906. Serial No. 349,367.

1. In a vehicle spring, the combination with a main spring, of a coiled auxiliary spring having a terminal coil provided with an arm arranged for slidable engagement with a member of said main spring, and means whereby said terminal coil is rigidly and immovably secured to said main spring member, substantially as set forth.

871,930. Patch for Pneumatic Tires. Gustaf Hagstrom and Emanuel Hagstrom, Lindsborg, Kan., assignors to The Hagstrom Bros. Manufacturing Company, Lindsborg, Kan. Filed Sept. 24, 1906. Serial No. 335,943.

1. A patch of the class described comprising a band to go around an inner tube having clips at its ends to engage the edges of an outer tube and provided with a flap forming an extension of one end to lie between the inner tube and a wheel rim, substantially as described.

871,945. Tire. Robert M. Merriman, Youngstown, Ohio. Filed March 13, 1907. Serial No. 362,168.

1. In combination, a soft tread tire, metal reinforcements embedded in opposite sides thereof, each reinforcement consisting of a number of strands twisted together, and lacing embedded in the tire and connecting said reinforcements and passed between the strands thereof to maintain fixed position.

871,946. Combined Speed Indicator and Recorder. George E. Mirfield, Joliet, Ill. Filed March 5, 1906. Serial No. 304,298.

1. In a device of the class described, in combination with a clock mechanism, a face plate surrounding the arbor for the hour hand, and revoluble therewith and adapted to revolve a chart, a stationary transparent clock face having the numbers marked thereon in a ring in front of the face plate, and a recording arm carrying an inscribing instrument, the latter being movable under the transparent clock face and outside of the ring of hour numerals, substantially as described.

871,949. Ball Bearing. Paul J. McCullough, St. Louis, Mo. Filed Feb. 20, 1907. Serial No. 358,401.

1. A ball bearing comprising a member consisting of a single piece which is provided with an approximately channel shaped groove that constitutes ball races, a co-operating member composed of a plurality of parts that constitute co-operating ball races, means formed in sections and arranged between said parts to hold them separated, and a pluralitv of rows of balls arranged between said races; substantially as described.

871,973. Multipart Mold for Pneumatic Tires. Friedrich Veith, Veithwerk, near Hochst, Germany. Filed Jan. 28, 1907. Serial No. 354,413.

1. A mold for pneumatic tire covers comprising a core having an internal chamber and a gutter or depression at the lower part of said chamber for the reception of condensation water, and a drain pipe leading from said depression.

872,012. Oil Cup Lubricator. William P. Phillips, Boston, Mass. Filed Feb. 6, 1907. Serial No. 356,023.

1. A lubricator having a valve spring pressed to its seat, said valve having a cap thereon, a valve casing, a screw threaded connection between said cap and the valve casing, means engaging said cap to lift the valve from its seat, a cover for the lubricator and a coiled spring interposed between and bearing against the cover and the cap.

872,031. Automobile Body. Willie O. Thomas, Riverside, and Harry G. Moore, Chicago, Ill. Filed Aug. 29, 1906. Serial No. 332,412.

1. An automobile body having side-bodies formed of sheet metal extending continuously both above and below the floor plane of the body throughout the principal length of the body, and laterally outstanding structural members rigidly secured to said side bodies below said floor plane and forming reinforcements to the transverse and vertical strength of the side bodies.

872,040. Rotary Pump. Gunnar Anderson and Richard Lundin, New York, N. Y. Filed Aug. 21, 1907. Serial No. 389,443.

1. A pump comprising a cylindrical casing having head plates secured to the opposite ends thereof, said casing being provided in its opposite ends with annular chambers and said head plates with corresponding annular chambers in communication therewith, said casing being also provided with a central longitudinal cylindrical chamber, a drum or cylinder mounted in said chamber and of less diameter than said chamber and provided at one side with a longitudinal piston member adapted to closely fit the walls of said chamber, said drum or cylinder being also provided with a shaft by which it is rotated, a plurality of longitudinally arranged cylindrical valves located in said casing and geared in connection with said shaft, said valves being positioned so as to fill the space between the outer walls of said chamber and the drum or cylinder mounted therein, said valves being also provided with longitudinal recesses, and a plurality of longitudintl chambers in said casing, said chambers being arranged in pairs at the opposite sides of said valves and being provided with ports or passages which communicate with the chambers in which said valves are placed, one of the heads of the casing being provided with an inlet pipe in communication with the annular chamber formed therein and the other head of the casing being provided with an outlet pipe which communicates with the annular chamber formed therein, substantially as shown and described.

872,075. Sparking Device. Harry A. Miller, Pasadena, Cal., and Benjamin G Gilbough, Chicago, Ill. Filed Feb. 14, 1906. Serial No. 301,103.

1. An ignition device, for the purpose set forth, comprising a cylinder adapted to communicate with the engine cylinder, a spring held gas actuated piston movable therein, a vibratory electrode extending above the base of and outside of said cylinder, a gas tight bearing for said electrode, and means connected with the piston and with the outer end portion of the vibratory electrode for actuating the vibratory electrode.

872,096. Means for Preventing Side Slip in Pneumatic Tires. Louis E. Treffiere

Digitized by Google

and Victor J. Jehin, Paris, France. Filed March 9, 1906. Serial No. 305,189.

In a device of the class described the combination of a plurality of strips secured to the tire tread, said strips being located upon the tire in a plane co-incident with the plane of rotation thereof and in aligned rows, the strips of each row being spaced apart longitudinally at their ends and disposed upon the tread in staggered relation to bring said spaces between the ends of the strips of one row out of transverse alignment with the spaces of strips adjacent rows, said strips being provided with laterally projecting attaching ears formed to provide intervening recesses of the strips of adjacent rows.

872,133. Rotary Motor. Justus R. Kinney, Dorchester, Mass. Filed April 29, 1907. Serial No. 370,967.

1. In a device of the class described, the combination of a casing having a cylindrical chamber; an eccentric piston therein; a continuous peripheral band thereon; and means whereby said band may be adjusted about the periphery of said piston and clamped in adjusted position.

872,164. Gas and Gasolene Engine. Earl E. Wright, Mansfield, Ohio. Filed Oct. 27, 1906. Serial No. 340,833.

1. In an engine of the class described, a housing in two portions and having half bearings in their adjacent faces, cylinders mounted upon said housing, the rods spaced apart and extending through said housing and connected to said cylinders, pistons operating in said cylinders, piston rods connected to said pistons and provided with transverse slotted cross heads slidably engaging said tie rods, and a shaft journaled in said housing bearings and provided with cranks operating in said slotted heads.

872,186. Speed Recording Instrument. Cascious H. d' la Monte, Philadelphia, Pa., assignor, by mesne assignments, to International Speed Register Co., Philadelphia, Pa., a Corporation of New York. Filed March 21, 1906. Serial No. 307,235.

1. A speed recording instrument for the purpose set forth having a punching mechanism comprising a reciprocatory punch for puncturing a dial to form a record, a casing for the punch, and a plurality of combs having the outer ends thereof secured to the wall of the casing, said combs projecting inwardly, suitably spaced apart and adapted to have the dial enter between the inner ends thereof, the tines of the combs constituting guides for the punch, combined with means for actuating the punch and for intermittently varying the size of the punctures during the operation of the instrument.

872,188. Cab Fare Indicator. Charles Mascart, Paris, France. Filed Oct. 13, 1905. Serial No. 282,665.

The combination of a drum provided with means to indicate the amount of fare paid, a ratchet wheel fixed to said drum, a spring for imparting movement to the drum when the ratchet wheel is released, a lever provided with a detent adapted to engage the ratchet wheel to prevent the rotation thereof in one direction, a pawl engaging said ratchet and adapted to prevent the rotation thereof in the same direction and further adapted to impart an impulse to the ratchet wheel in an opposite direction, a lever carrying said pawl and having an upwardly extending arm adapted to be moved into engagement with the lever carrying the detent, thereby shifting said detent out of engagement with the ratchet wheel and further shifting the pawl out of engagement with the ratchet wheel, a pair of cam members, one of said members adapted to engage said arm for moving it into engagement with that lever which is provided with a detent, and the other of said members adapted to engage said arm for lowering it, thereby shifting said pawl to impart an impulse to the ratchet wheel, and means for retaining the retent and pawl in engagement with the ratchet wheel when said cam members are out of engagement with said arm.

872,213. Battery Support for Automobiles. Samuel R. Bailey, Amesbury, Mass. Filed Jan. 4, 1907. Serial No. 350,734.

1. In combination with an automobile frame, a base adapted to support the batteries thereon, a series of three suspension rods having heads at each end provided with oppositely disposed spherical shaped faces, said frame and said base each having apertures, through which said rods pass loosely, and having oppositely disposed recesses about said apertures, the bottoms of which are adapted to receive the spherical faces of said heads to permit said base to swing freely in any direction with relation to said frame, as and for the purpose set forth.

872,220. Transmission Gear. Allen P. Boyer, Goshen, Ind. Filed April 1, 1907. Serial No. 365,707.

1. The combination with the axle shafts, of gears thereon; a pair of gear shafts arranged transversely of said axle shafts; sleeves splined upon said gear shafts; pairs of gears revolubly mounted on said sleeves adapted to alternately engage said axle gears as said sleeves are shifted; pairs of ratchet clutch members through which said gears are connected to said sleeves, splined thereon; springs for holding said clutch members yieldingly in engagement with said gears; a pivoted lever connected to said sleeves for simultaneously shifting them in opposite directions, whereby the desired gears thereon are brought into mesh with said axle gears; a shifting link for said lever; a driving shaft; a pair of driven shafts arranged one at each side of said driving shaft and parallel thereto; combination universal and slip joints for connecting said driven shafts to said gear shafts; adjustable bearings for said driven shafts; connecting links for said bearings whereby they are adjusted in unison to throw them toward or from said driving shaft; a stop on one of the said connecting links for said adjustable bearings arranged to engage the operating link for said sleeve shifting lever; a plurality of friction gears of different diameters splined upon said driving shaft; means for shifting said gears on said driving shaft; and a plurality of gears of different diameters on said driven shafts, adapted to be brought into driving engagement with said gears on said driving shaft.

872,226. Spring. Chauncy T. Edgerton, Richmond Hill, and Welford J. Golden, Oswego, N. Y. Filed Sept. 10, 1907. Serial No. 392,139.

1. In a leaf spring, an auxiliary plate of less camber than the working plates of the spring and tending by its reaction to substantially reduce the free height of the spring.

872,246. Fastening Device for Pneumatic Tire Protectors. Roy H. Morris and Elvin E. Townsend, Oakland, Cal. Filed June 28, 1906. Serial No. 323,833.

1. In a fastening device for pneumatic tire protectors, a pair of blocks, each provided with a perforated ear and a longitudinally disposed flange, said perforation being conical, and the flanges being opposite each other, whereby a recess is formed between the flanges when the blocks are in position, one of said blocks being provided with a transverse screw threaded aperture, and the other one with a screw threaded lug adapted to fit in said aperture and hold said blocks together with said flanges in engagement with the rim of a wheel when in position, a nutted bolt through each ear and a hooked plate pivotally secured to the lower end of said bolt adapted to receive the perforated edge of the tire protector.

872,311. Vehicle Wheel. Emil Sutherland, Hollywood, Cal. Filed Nov. 2, 1906. Serial No. 341,728.

1. A vehicle wheel having a non-deformable rim; carrying springs interposed between the spokes and the rim and workably connecting the same together; annular plates forming hubs and carrying the spokes pivotally connected thereon; compensating springs, extending from the inner end of one spoke to the inner end of another spoke, and said springs being keyed to one spoke, and having a sliding fit in a socket in another spoke.

872,336. Internal Combustion Engine. Lucius T. Gibbs, Hempstead, N. Y. Filed May 2, 1906. Serial No. 314,742.

1. In an internal combustion engine, the combination of a cylinder, a piston, said cylinder having inlet and exhaust ports uncovered by the piston as it approaches the limit of its forward stroke, the piston having an apertured lip whereby the exhaust port after being opened, is closed during the continued forward movement of the piston, and means to withdraw the burned gases from the cylinder while the exhaust port is closed and the inlet port is opened.

872,362. Pneumatic Spring and Shock Absorber for Motor Vehicles. Albert L. Muren, Belleville, Ill. Filed Oct. 18, 1906. Serial No. 339,432.

1. In a vehicle, the combination with an axle and frame, of an upwardly projecting compression member suspended beneath said axle from said frame, a resistance member beneath said axle above said compression member and slidingly connected therewith, and a pneumatic shock absorbing cushion located between said compression member and said resistance member; said resistance member being of box shape and having a detachable wall, substantially as set forth.

872,453. Muffler. David Reid, Ithaca, N. Y. Filed July 22, 1904, Serial No. 217,680½. Renewed June 19, 1905. Serial No. 266,044.

1. In a muffler, the combination of an expansion chamber, a passage for the flow of gas opening into said chamber, means disposed in said passage for retarding the flow of gas therethrough, and means for creating a partial vacuum in said chamber.

872,472. Fastening for Resilient Tires. Otto G. Stole, Chicago, Ill. Filed Sept. 10, 1906. Serial No. 338,918.

1. A resilient tire attachment comprising a main plate metal ring having a concave peripheral portion, marginal beads at the sides of said peripheral portion, and a laterally and inwardly extending attaching web, said peripheral portion, marginal beads and attaching web being integrally formed, a supplementary plate metal ring having a laterally and inwardly curved form and its outer edge tucked into the recess between the adjacent bead and the main ring for retention, and bolts passing through the

Digitized by Google

parts and through the wheel rim to secure the parts together, substantially as set forth.

872,505. Carburetter. George H. Gere, Utica, N. Y. Filed March 30, 1906. Serial No. 308,865.

1. The combination of a case having a depression in the bottom thereof, means for admitting a current of air to the case, means for removing a combustible mixture from the case, a vertically adjustable sleeve in the case, a nozzle in the case, an air tight tank above the case, a pipe connecting the bottom of the tank and the nozzle and having means for longitudinal expansion, a pipe extending from the depression to the upper part of the tank and vertically adjusted relative to the case by means of the sleeve.

872,512. Power Transmission Device. Joseph W. Hays, Chicago, Ill. Filed March 25, 1907. Serial No. 364,422.

1. In a clutch mechanism the combination with a revoluble driving member and a concentric revoluble driven member having aligning axes, of a series of segmental shoes arranged in circumferential order one after the other and connected to the outer one of said members, and means for causing said shoes to engage the other member one after the other.

872,527. Motor Starter. Adolph W. Manz, Chicago, Ill., assignor to Paul H. Manz, Chicago, Ill. Filed Feb. 26, 1906. Serial No. 302,922.

A starting device for motors, in combination with the motor main shaft, a lever loosely mounted on said shaft, split bearings on said shaft embracing said lever, a split ratchet wheel secured on said shaft adjacent to said lever, pulleys mounted on said lever near its ends, operative means for making traction upon said lever, said operative means consisting of a flexible and a yielding portion, said flexible portion passing over said pulleys and provided with a handle, a pawl pivoted to the lower and forming a link between the said portions of the operative means for the lever, means

Why not equip your car with a Splitdorf Coil and be totally free from all ignition troubles?

"A Good Thing and a Ready Seller"

PROVIDENCE, R. I., Jan. 28, 1908

THE BICYCLING WORLD CO.,
154 Nassau Street, NEW YORK.

DEAR SIRS:—

Please send me at once two dozen copies of Care and Repair of Motorcycles. I sold the first copy fifteen minutes after its receipt. I am sure the book will prove a good thing and a ready seller as during the last two years I have had lots of inquiries for something of the sort.

B. A. SWENSON.

Should be in the hands of every repairman and rider.

64 pages, chockful of useful advice and suggestion. Coated paper; linen cover.

THE BICYCLING WORLD CO.
154 Nassau Street, NEW YORK

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets or the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

WANTED—Traveling salesman, experienced in selling large cars. Territory east of Pittsburg. Give reference and experience. Address N. M., Box 649, New York City.

FOR SALE—Model K Cadillac runabout, excellent condition, complete with top, lamps and generator. THE HARTFORD RUBBER WORKS CO., Hartford, Conn.

FOR SALE—Absolute closing out sale of the largest stock of new and second-hand automobiles in the United States. Write for Clearance Sale List No. 21. Now is the time to buy. ROCHESTER AUTOMOBILE CO., Jos. J. Mandery, Prop'r., Rochester, N. Y.

FOR SALE—$100 to $500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from $640 to $1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

for retaining the lever in inoperative position, and means for preventing the untimely operation of said lever.

872,571. Internal Combustion Engine. Fritz Moser, St. Aubin, Switzerland. Filed Dec. 14, 1906. Serial No. 347,812.

In an internal combustion engine, the combustion of valve-actuating devices; a shaft for operating the same; a casing for said devices; a cover for said casing, said cover being formed on its outer face with an interrupted annular rib and said shaft projecting through said cover within said rib; an electric ignition device mounted upon said rib; and means mounted on the projecting end of said shaft for operating said ignition device; the interruption in said rib permitting the oil which exudes from said casing along said shaft to flow away from said ignition device.

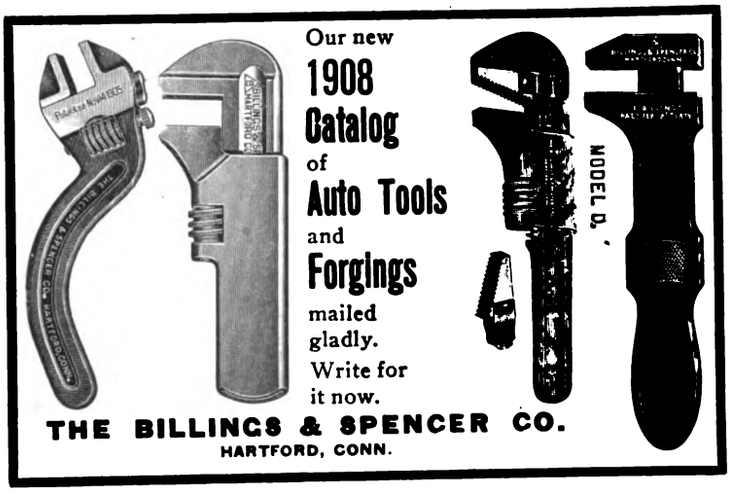
872,645. Resilient Tired Wheel for Self-Propelled Vehicles. Edwin M. Carhart, Providence, R. I. Filed Feb. 16, 1907. Serial No. 357,625.

1. In a wheel of the character described, the combination with the rim, a pair of oppositely disposed annular metal plates rigidly secured to the front and rear sides of the rim, and a continuous annular rubber tire member having a substantially concavo-convex form cross-sectionally seated in and being supported by said plates, of a plurality of short radially extending air-tight cylinders arranged around and rigidly secured to said rim member, a suitably packed piston or plunger block movably mounted in each cylinder, its upper or head portion being enlarged and fitted to the adjacent concave part of the tire, and a continuous hoop or band of metal extending circumferentially around and being secured to the heads of the pistons, all constructed, arranged, and adapted for operation substantially as hereinbefore described.

872,732. Automobile Air Brake. James T. Johnson, Memphis, Tenn. Filed Oct. 22, 1906. Serial No. 339,937.

1. In combination with a motor driven vehicle, and brakes for said vehicle, a brake cylinder having a piston, connections between the rod of said piston and the said brakes, an air reservoir, a brake valve casing, and a brake valve in said casing, connections between said air reservoir and the brake valve casing, and between said brake valve casing and the brake cylinder, and a single actuating element for controlling the motive power of said vehicle and said air brake valve.

872,774. Motor Car. Cornelius P. A. Van Ferls and Josephine M. Kneeland, New York, N. Y. Filed May 24, 1907. Serial No. 375,505.

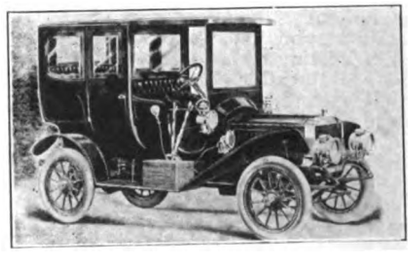


1. A car body supporting frame for a motor car and comprising opposite side frame members each of which is depressed midway of its length, and a supplementary frame provided with a rearward cross bar connected with said side frame members where depressed and provided with a downwardly bent forward cross bar connected with such members above said depressed parts, and longitudinal bars forming part of the supplementary frame and disposed in a plane substantially parallel with the depressed parts of the side frame members and connected with both parts of the side frame members and connected with both cross-bars.

872,820. Air Guide or Steering Device for Automobiles. James T. Johnson, Memphis, Tenn. Filed Oct. 8, 1906. Serial No. 337,909.

1. The combination with the running gear of an automobile, of a reservoir for fluid under pressure, a fluid receiving cylinder divided into two compartments each in communication with the reservoir, pistons in said compartments of the fluid receiving cylinder connected with the steering wheels, a steering post, and a valve interposed between the fluid receiving cylinder and the reservoir and controlled by said steering post to admit air from the reservoir to said compartments of the fluid receiving cylinder.

872,825. Apparatus for Checking or Deadening the Vibrations Imparted to Suspended Vehicles. Arthur Krebs, Paris, France, assignor to Société Anonyme des Anciens Establissements Panhard et Levassor, Paris, France. Filed March 29, 1906. Serial No. 308,769.



1. An apparatus of the class described, comprising a case, a movable member arranged within the case, superimposed washers alternately connected to the movable member and the case, an elastic element co-operative with the case and the movable member, and cam elements, one cam element carried by the case and the other by the movable member, and the cam faces of each adapted to traverse one another.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exengencies of street traffic without any changing of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

The Last Word in GREAT ARROW Car Construction is LUXURY

The four-cylinder GREAT ARROW was and still is a good car as far as efficiency in service is concerned. The six-cylinder adds a touch of luxury, due to ABSENCE OF VIBRATION, which sums up in one word the chief argument in favor of the six-cylinder GREAT ARROW.

THERE ARE MANY MINOR ADVANTAGES, such as lighter weight of certain parts, ease in starting, possibility of running in traffic on a high gear and other things that will appear to the experienced motorist, but after all, THE ONE GREAT ARGUMENT IN FAVOR OF SIX CYLINDERS IS COMFORT.

A motor car is a pleasure vehicle, and the more comfortable we can make it, the more nearly it becomes the ideal pleasure vehicle, and comfort, luxury, the sensation of gliding rather than being propelled by machinery, are the results attained in the six-cylinder GREAT ARROW.

HERE ARE THE 1908 TOURING CARS

- **4-cylinder Great Arrow, 30 H. P., Price, $4,000**
- **4-cylinder Great Arrow, 40 H. P., Price, $5,000**
- **6-cylinder Great Arrow, 40 H. P., Price, $5,500**
- **6-cylinder Great Arrow, 60 H. P., Price, $6,500**

A dependable car
A responsible maker

Over half a century's reputation for honorable and orthodox business methods should appeal to every prospective purchaser of a car, and to every live dealer with an eye to the future. The STUDEBAKER policy may be summarized in four words

"Good, or Made Good"

It's worth much to know that the firm that makes your car is both able and willing to give you a square deal.

Studebaker

Garford

The Product of Evolution

For twenty years the automobile has been undergoing a process of active evolution.

The competent observer now recognizes the existence of the "TYPE" which would be properly representative of that development.

We believe the Garford is very close to it.

It is not an experiment, but an embodiment of the sifted, approved, combined experience of the multitude of workers of the past decades.

Our aim is not to depart from, but to adhere to the invaluable experience of the past.

The Car of Steady Service

as applied to the

Rambler

is more than a mere phrase, it is a title earned through correct design and careful construction and proven by years of hard, constant service wherever power-driven vehicles are known.

The practical qualities that established the Rambler reputation are,—

1st—APPLIED POWER. By this we mean actual tractive force as applied to the road wheels. Owing to the straight line drive of the four-cylinder models and the direct chain drive in the two-cylinder cars, Ramblers have greater propelling force per pound than any other car on the market.

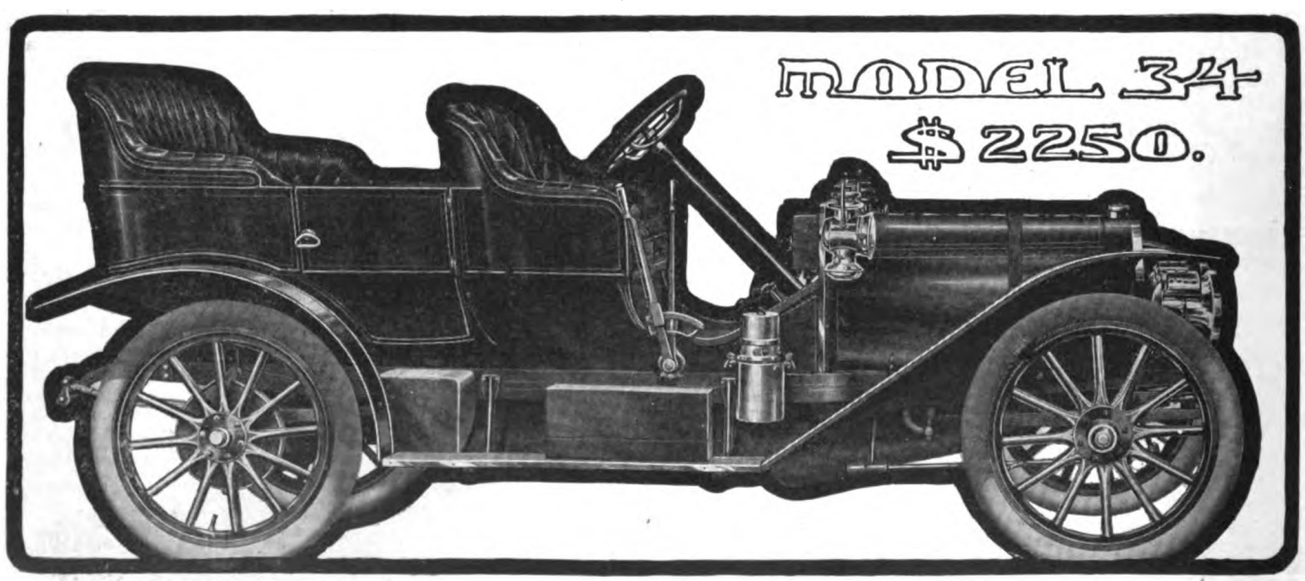
2d—DEPENDABILITY. Ramblers are built to stand the test of hard, daily service over the worst of American roads. This condition is not reached by mere weight and masses of metal, but by simple, scientific construction in which each element is stronger than the strains upon it can ever require.

3d—PRACTICAL ROAD VALUE. With the vast facilities of an enormous plant like the Rambler factory, skillfully directed to the production of two models only, greater value per dollar can be offered than is possible in a plant of lesser output.

In short, the Rambler is a car of

Power, Service and Value

Ordinary business policy dictates a careful examination of its many high qualities before ordering your new car.



Our 1908 catalog fully describing two touring cars and a high-powered roadster is at your service: write to-day.

Volume XVII. New York, U. S. A., Thursday, February 13, 1908. No. 20

SEARCHMONT CAN'T SHARE SURPLUS

Supreme Court Upholds Cancellation of Its Selden License—End of an Unusual and Persistent Suit.

The trustees of the bankrupt Searchmont Automobile Co., of Philadelphia, have lost the third and final round of their fight for a share of the Association of Licensed Automobile Manufacturers' surplus and to force the restoration and permit the sale of the Searchmont's cancelled license.

The decision of the Searchmont appeal to the New York Supreme Court was handed down this week by the Appellate division. It affirms the ruling of Judge O'Gorman in the lower court, the decision of the five judges comprising the division substantially being: "No cause of action established; complaint dismissed with costs."

In Justice O'Gorman's decree he cited clearly his opinion as to the rights and liabilities of members of an unincorporated association and the association itself. In part he said:

"The rights and liabilities, however, are always controlled by the articles of association, which constitute a contract, the terms and provisions of which are binding on all its members, and the courts cannot redress any act of an association in the expulsion or punishment of a member or the forfeiture of his membership when such action has been taken in accordance with the express conditions of association articles."

The Searchmont Automobile Co., then a member of the A. L. A. M., went into bankruptcy in 1904, and as it had failed to pay royalty due on its product, its license was promptly cancelled. Some time afterward, the trustees brought suit in the Pennsylvana courts against the association, but the case was dismissed for lack of jurisdiction. It was then renewed in New York in the Supreme Court, and was decided adversely to the Searchmont interests. They then carried it to the appellate division, which, as stated, just has sustained the lower tribunal.

It is the only instance in which the Selden license, as such, and the "working agreement" of the licensing association have been put to the legal test and as such the decision is of no small interest. Interest in the case was further heightened by the general understanding that while the Searchmont trustees were but nominal complainants, the man behind the scenes was really the attorney for the Ford Motor Co., who sought to lay bare the books and accounts and other figures of the members of the A. L. A. M.

Receivers Begin Suit Against Grout.

Following the recent examination of Karl Grout, at which some evidence was taken bearing on a charge of conversion of assets, the receivers of the Grout Bros. Automobile Co., Orange, Mass., have instituted suit against Charles B. Grout, formerly senior member of the concern. The action is to recover $10,000 for the alleged conversion of two automobiles, $2,500 in cash and sundry machine parts. Meanwhile it is stated that Rossell Drisko, former manager of the Bay State Automobile Co., Boston, has been engaged to take charge and operate the Grout plant.

To Build Cars in California.

The Stanford Automobile and Mfg. Co., has been formed in Palo Alto, Cal., to manufacture a two-cylinder touring car. It is capitalized at $75,000, and work his been commenced with ten men in the Stanford Automobile Co.'s garage at 511 Alma street. H. W. Hooper, J. E. Sloan, Frank Sloan and F. S. Hitchins are the men interested in the venture, Hooper and Hutchins being the owners of the patent which will be operated.

Fields Advanced to Vice-Presidency.

Harry E. Fields, sales manager of the Hartford Rubber Works Co., has been elected vice-president of the company. He will make New York City his headquarters.

BRISCOE AGAIN HEADS A. M. C. M. A.

All Other Officials Also Are Re-elected at Annual Meeting—Show Situation is Discussed at Length.

At the annual meeting of the American Motor Car Manufacturers' Association, which occurred in Detroit on Friday and Saturday last, 7th and 8th inst., the incumbent members of the committee of management all were elected their own successors, as follows:

Benjamin Briscoe, chairman; R. E. Olds, vice-chairman; H. O. Smith, treasurer; Wm. Mitchell Lewis, secretary, and W. H. Van Dervoort, auditor.

Three new members of the committee of management were elected for three year terms. They were C. G. Stoddard, Dayton Motor Car Co.; Barney Everitt, Wayne Automobile Co., and Wm. Mitchell Lewis, Mitchell Motor Car Co. The other members of the committee are: Charles Lewis, Jackson Automobile Co.; W. C. Marmon, Nordyke & Marmon Co., and Alfred Reeves, General Manager.

The annual reports proved that the past year had been an auspicious one. The treasury was never so full. As evidence, $5,000 was voted for the work of the Good Roads committee and a rebate of 25 per cent. will be paid to all members who exhibited at the October show in Grand Central Palace, New York.

The reports indicated that there had been a slight falling off in the sale of cars in the big cities during the last three months of 1907, but that as an offset there had been an increase in the sale of cars in cities of less than 50,000 inhabitants.

The subject of future shows afforded prolonged discussion. The whole matter finally was referred "with certain recommendations" to the show committee. The nature of the recommendations was not disclosed, but it is known that the association favors continued co-operation with the Automobile

Digitized by Google

Club of America, but on a somewhat altered basis. If the club should not care to again undertake the promotion or management of the "independent" show in New York, the A. M. C. M. A. itself will assume the task. The subject, however, has not been discussed by the club, nor have the manufacturers named their new show committee which will enter into conference with the clubmen at the proper time. At the Detroit meeting, there was considerable difference as to whether December or January is the best show month. No one, however, is anxious for another October exhibit.

The A. M. C. M. A. voted to co-operate also with the A. A. A. in the matter of tours and races, a special committee for the purpose being appointed for the purpose, viz.: H. O. Smith, chairman, Premier Motor Manufacturing Co.; A. C. Newby, National Motor Vehicle Co.; W. C. Marmon, Nordyke & Marmon Co.

Storage Battery to Cut Capital.

At the annual meeting of the Electric Storage Battery Co., of Philadelphia, owners one-third of the capital stock of the Electric Vehicle Co., which will be held March 18, it seems certain that the stockholders will then vote to reduce the par value of the company's stock from $100 to $50 per share. President Lloyd says that this measure has been suggested by several of the largest stockholders, among whom are Thomas Dolan, Rudolph Ellis, Herbert Lloyd, George D. Widener, P. A. B. Widener, Authony N. Brady, Harry Payne Whitney, H. H. Vreeland, and Grant B. Schley.

According to the last annual report, the company's outstanding stock consists of $17,785,800 common and $214,200 preferred. But since the issuance of the report all of the preferred stock, with the exception of a few hundred unassenting shares, has been called in. The preferred is entitled to dividends of 1 per cent. per annum, cumulative, but both classes of stock have received 5 per cent. yearly since January, 1901.

The stockholders who suggest the reduction in the amount of stock outstanding consider that it is too large for the company's assets. In the last report these were stated at $22,225,209. The largest item was "Patents, agreements and franchises, $13,661,626."

The common stock of the Electric Storage Battery Co. is considered active in Philadelphia, where it is traded in. There it has declined from 75 to 28½.

Mabley Leaves the Salon.

C. R. Mabley has resigned the management of the Importers Automobile Salon. He has been succeeded by his former chief assist. W. R. Lee. The Importers offices will be maintained in the Bryant Park Building, New York, but hereafter they will be shared by the New York Automobile Trade Association—the local retailers' organization—an arrangement to that end having been consummated.

The Week's Incorporations.

Somerville, Mass.—Davis Square Auto Co., under Massachusetts laws, capital not stated. Manager, Winsor L. Snow.

Philadelphia, Pa.—American Automobile Equipment Co., under Delaware laws, with $100,000 capital. Corporators not stated.

Racine, Wis.—Miller Motor Co., under Wisconsin laws, with $25,000 capital; to deal in automobiles. Corporators not stated.

East Orange, N. J.—Motor Car Supply Co., of New Jersey, under New Jersey laws, with $25,000 capital. Corporators—Charles D. Geyer, Frank C. Ferguson and Frank E. Ruggles.

Columbus, Ohio—Field-Snyder Automobile Co., The, under Ohio laws, with $10,000 capital. Corporators—John Field, George Snyder, G. E. Snyder, and S. J. Field, all of Columbus.

Evansville, Ind.—Lannert Mfg. Co., under Indiana laws, with $25,000 capital; to deal in carriages and automobiles. Corporators—Henry N. Lannert, Margaret Lannert and Louisa N. Lannert.

Morris, Ill.—Morris Automobile Garage Co., under Illinois laws, with $2,000 capital, to do general garage business. Corporators—Landy Hoge, J. B. Moss, Joseph Pattison, O. T. Wilson and M. B. Wilson.

New York City, N. Y.—Ennis Rubber Mfg. Co., under New York laws, with $50,000 capital; to manufacture rubber tires, etc. Corporators—F. J. Ennis, Brooklyn; J. M. Beasy, C. N. Foster, New York City.

New York City, N. Y.—Wayne Motor Car Co., under New York laws, with $10,000 capital; to deal in automobiles. Corporators—Frank A. Sanford, Roselle, N. J.; Andrew C. Knoller, 141 Broadway; Julian B. Beatty, 529 West 111th street, New York City.

New York City, N. Y.—Universal Auto & Motor Boat Supply Co., under New York laws, with $10,000 capital. Corporators—Brutus von Schwanenfluegal, 134 East Seventy-second street; William H. Orth, 181 Prince street; John J. Kennedy, 38 East Twenty-second street, New York City.

In the Retail World.

Roy Quimby and D. D. Cummings have "opened" in Mankato, Minn. The Ford will be carried.

W. M. Ball and C. A. Stotler have opened a garage in Devil's Lake, N. D. The Cadillac, Franklin and Buick will be handled.

C. H. Bond has purchased the big Copley Square Garage, at 25-31 Irvington street, Boston, H. M. Gulesian being the grantor. The sale price is not stated, but the property is valued at $350,000.

Charles T. Jeffery, eldest son of the Kenosha manufacturer, has, in addition to his duties at the factory, assumed the presidency of the Rambler Garage Co., located at Sheridan road and Wilton avenue, Chicago. His brother, Harold W. Jeffery, is vice-president, and L. A. Richman secretary and treasurer.

Charles E. Miller's Cleveland branch has been removed from 406 Erie street to 1829 Euclid avenue. The new location brings the branch into the center of the city's automobile district.

Omaha (Neb.) dealers have organized the Automobile Show Association, to promote a show during the week beginning March 15th. J. J. Deright was elected president, and C. G. Powell, secretary-treasurer.

The two-story brick building at 235 West Sixty-ninth street, New York City, occupied by Harry Lauderbach as an automobile school and garage was damaged by fire Monday, 10th inst. Four cars were destroyed, the loss totalling $13,000.

Its "carnival week" proved so successful last year that the Indianapolis dealers have decided to repeat it during the week of March 16th to 21st next. As was the case last year the carnival will start with a decorated parade, and each salesroom along the row will be decorated for the occasion. As an added attraction a hill-climbing contest is on the tapis.

New Jersey Lops Off Dead Limbs.

The list of "dead ones," as those corporations in New Jersey who have not paid the taxes assessed them for two years are termed, was published this week. Many hundred corporations are, according to the State act, without legal right to do business, and their charters have been repealed. Among the long list of names are the following: American Rotary Engine Co., American Trimoter Co., Burlington Mobile & Transportation Co., Holyoke Automobile Co., Insular Auto Co., Kensington Automobile Co., National Automobile Co., Newark Motor Vehicle Co., Newark Pneumatic Puncture Proof Tire Co., Orange Automobile Co., Plainfield Auto Garage, Royal Automobile Co., Thermobile Co. of America, Thornycroft Motor Wagon Co. of America, Tuck Petroleum Motor Co., and the Upton Motor Co.

George N. Pierce Drops Business Cares.

George N. Pierce formally has retired from the Buffalo company which so long has borne his name. Practically, Mr. Pierce had not been active in the affairs of the George N. Pierce Co. for a year or so and has been planning gradually to relinquish business cares and to placidly enjoy the remainder of his days. He has made the first move in that direction by going South where he will spend the winter. His resignation as president brought about the election of the following officers, all of whom have been connected with the Pierce interests for many years: President, G. K. Birge; vice-president, Henry May; treasurer, Charles Clifton; secretary, L. H. Gardner. With W. H. Hoyt they constitute the board of directors.

WOMEN MIX THE SHOW SITUATION

They "Butt in" at San Francisco—Their Projected Exhibition Creates Discord Among the Dealers.

San Francisco is to have an automobile show after all, despite the vote of the Automobile Dealers' Association of California against such a project. It will be held in the Coliseum, March 2 to 8 inclusive, under the auspices of the California Woman's Automobile Club, and this fact has brought about a split in the trade association.

Ever since they, by a small majority vote, decided to abandon their annual show, there has been considerable friction among San Francisco's dealers. The minority, who wanted to hold a show, got after the women motorists and persuaded them to hold a show in March, the entire profits to go to the California Woman's Automobile Club.

The effect of the announcement was instantaneous. The dealers who had voted against a show, believing the present year not propitious for such an exhibition, circulated a petition among the dealers, to make them agree not to exhibit at the show promoted by the fair sex. Those who signed the agreement are said to be: C. S. Howard, Howard Automobile Co.; J. W. Leavitt, J. W. Leavitt & Co.; A. H. Hunter, Osen-Hunter Automobile Co.; Cuyler Lee, the Packard agent; J. H. Eagai, Studebaker Bros Co.; E. P. Brinegar, Pioneer Automobile Co.; G. A. Boyer, Boyer Automobile Co.; L. H. Bill, Thomas B. Jeffery & Co.; Max L. Rosenfeld, Auto Livery Co.; W. F. Culbertson, Mobile Carriage Co.; W. L. Huggson, Standard Motor Car Co.; Frank O. Renstrom, F. O. Renstrom Co.; Frank G. Miner, for the Locomobile Agency; the San Francisco Pope Auto Agency, and the White Co.

J. W. Leavitt, who circulated the petition, said that those who had signed it believed that the proper body to handle such exhibitions would be the dealers' association, and inasmuch as that body had decided not to hold the show, he could not see any necessity for such an exhibition.

It is safe to say that the California Woman's Automobile Club will not get a sanction from the Automobile Dealers' Association of California, the body which is supposed to grant sanctions for such affairs, and it is freely hinted that those dealers who exhibit in the women's show without sanction will probably be expelled. Despite this hatchet over their heads a number of dealers have decided to show at the Coliseum in March and the feminine club's show committee, composed of President Mrs. Fred J. Linz, Mrs. Abbie E. Krebs, and Mrs. Robert Christie, are going ahead with preparations. The women have announced a partial list of dealers who have promised to exhibit at the show, one of the peculiar features being that the Locomobile Agency, which is said to be against the show, according to Leavitt's petition, is also represented on the women's side. The other exhibitors, as announced, are: Keystone Automobile Co., City Hall Auto Co., Dragon Automobile Co., I. Freeman, Carmichael-Bray Automobile Co.; A. J. Hayes, Frayer-Miller agent; Rambler Automobile Agency, Maxwell-Briscoe Pacific Co., N. R. Cooper, Premier; Renault Freres Co., Pacific Motor Car Co., Winton Motor Carriage Co., and the Corbin Agency.

The Automobile Dealers' Association of California will hold a meeting shortly at which it is expected there will be unusual activity and "doings."

Pope Dividend is in Prospect.

Receivers Pope and Yule of the Pope Mfg. Co., Hartford, have closed a deal with a Chicago broker for the sale of the former Imperial bicycle plant in Chicago, for $100,000, a substantial part of which already has been paid. Options also have been given on other idle plants belonging to the Pope Mfg. Co., all of which its is expected will be taken up in the near future.

The affairs of the company are in a most prosperous condition. The Hartford plant is working full time and has had an average pay roll of more than $12,000 per week for the past four months; orders for Pope-Hartford cars are all that can be desired and prompt shipments are being made. Both of the Pope bicycle factories also are in full blast and are fuller of orders than at this time last year, the bicycle business, remarkable to say, having scarcely felt the effects of the financial depression.

The receivers have taken advantage of cash receivers have taken advantage of cash discounts on all merchandise contracted for, and last week every account due was paid. They are hoping that by April 1st a substantial dividend will be declared.

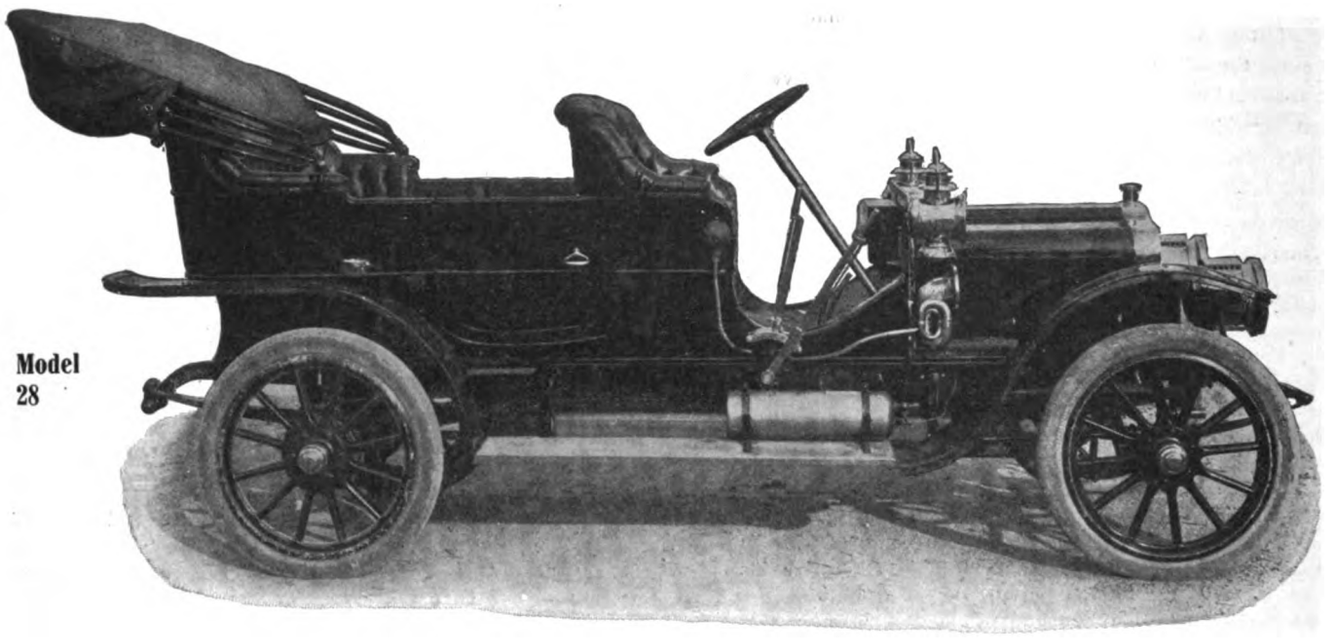
Almost an "International Case."

In the common pleas court at Hartford, Conn., on Tuesday last, 11th inst., there was heard the case of Thomas W. Fahy, of Hartford, against A. Clement, the Paris automobile manufacturer, for $872, balance due and interest. Fahy testified that about July 20, 1902, he entered the employ of Clement, who at that time was manufacturing small motors for bicycles and automobiles at a factory in Hartford, at a salary of $5 a day. He was engaged by William G. Allen, Clement's general manager and representative in Hartford. Fahy remained as superintendent of the factory till February 20, 1904, at which time the plant was closed and discontinued, a period of 436 working days. His salary amounted to $2.180 and the defendant has paid $1,308, leaving $872 due. During the management of Allen, Fahy had frequently asked that the balance of $2 a day be paid him and he had also asked M. Roquet, Mr. Clement's nephew, who succeeded Mr. Allen.

$100,000,000 MARK IS PASSED

Census of the Automobile Industry Shows Volume of Business for 1907—Story Told in Big Figures.

While many presentments of more or less elasticity have been printed, designed to show the volume and importance of the automobile industry, what undoubtedly is the most careful compilation of figures and what fairly may be accepted as a census of the automobile industry just has been completed by the Association of Licensed Automobile Manufacturers. Their records are such that they know to the last car what is the output of their members, and by intelligent and diligent inquiry they have been able to arrive at a fair estimate of the extent of business transacted by the others in the trade.



As a result of this research the statement is made that the value of the product sold during the year of 1907 was $105,669,572, the capital employed was $171,448,769, and the number of employes engaged 108,500. The number of pleasure gasolene cars manufactured in this country is placed at 47,302, of an aggregate value of $96,169,572. There also were produced 5,000 steam and electric pleasure vehicles, of a total value of $7,500,000, thus giving a total of 52,302 pleasure automobiles sold in the past twelve months with a total value of $105,669,572.

The percentage of increase each year has been consistent, as shown from statistics gathered in 1904, which show the value of the total output $26,645,064 as against $105,669.572 for the year 1907. Based upon accurate knowledge of the number of employes and the production of a large number of automobile factories, it is estimated that the total number of employes directly employed in the factories is 58,000. and the capital employed $94,200,000. As in many other manufacturing products, there is an indirect investment which is closely allied to vehicle manufacture. This includes such products as tires, rims, lamps, speedometers, drop forgings, etc. Close estimation shows that there are 29,000 employed in this indirect manufacture with total capital employed of $36,700,000. Unlike many other manufactured products the sales end of the automobile industry is exceedingly expensive. At the close of the year 1907 there were 2,151 sales and garage establishments employing 21,500 people, with a capital of $57,500,000 invested to do this business. This includes real estate, rentals, insurance bonds and interest on money invested.

By adding the Selden $2,000 light touring car to their account, the Palmer & Singer Mfg. Co., New York, have completed the readjustment of their lines. They thus will offer the choice of Seldens, P & S's, and the imported I. F.

THE SELDEN CAR

Model 28

Five Passenger Touring Car $2000
Three Passenger Runabout $2000

An Attractive Car at an Attractive Price

SPECIFICATIONS

Engine—4 cylinders, 4¼ x 4½, 28-30 brake horsepower.
Transmission—3 speeds forward and reverse, selective, Timken bearings.
Wheel base—109 inches; tread, standard; clutch, cone leather.
Body—sheet metal, straight line type, roomy and comfortable.
Tires—32x3½, quick detachable; make optional.
Frame—pressed steel, 4¾ inches deep.
Front axle—single I-beam drop forging, ball bearings.
Rear axle—bevel gear drive, enclosed type, roller bearings.
Ignition—synchronized jump spark.
Weight—empty, 2,200 lbs. (actual, not catalog).

NEW YORK, FEBRUARY 13, 1908

About "Jersey Justice."

It is fetching matters pretty far when the unfriendly critics of the organization assert that the plainly spoken address of President Hotchkiss of the American Automobile Association at the Newark banquet had anything to do with the "shakedown" introduced by Senator Frelinghuysen a few days later in the New Jersey Senate. In his inaugural speech, Governor Fort had recommended such a course and it was well known that a bill embodying his views was in preparation. Mr. Hotchkiss's words neither quickened nor retarded the action of Senator Frelinghuysen. He already was cocked and primed for another assault on the automobilists' pocket books. They always have proved such "easy picking," that any "robber State" need have small cause for timidity.

Plain speech was sadly needed in New Jersey and it served best just when and where and in the fashion that it was delivered by Mr. Hotchkiss—directly to the elected promoters and advocates of that form of extortion. The mock heroics and mock regrets of New Jerseymen, who, like Frelinghuysen himself, earn in New York the daily livelihoods which they spend in New Jersey, is as amusing as it is inconsistent. The fact that the Hotchkiss address stung Governor Fort to retort is a hopeful sign. The Governor's excuse for the extortion is the first official explanation that ever has been vouchsafed.

What if the road between New York and Philadelphia does lie in New Jersey? The road between New York and Buffalo lies in New York, as does the road to Coney Island, and it is a safe assertion that the latter, at least, is used far oftener by New Jerseymen than the road to Philadelphia is used by New Yorkers.

What if New York motorists do make frequent use of the roads to the New Jersey seaside resorts? Do they not pay expensive "toll" to the New Jersey roadhouses, hotels and garages every time they visit one of the resorts? And would not the revenues of the latter shrink sadly if it were not for the patronage of the New Yorkers and Pennsylvanians? If New Jersey maintains good roads to the resorts, is it any more than the State owes to its citizens who wax fat at the expense of "outlanders"? The citizens pay taxes that they may thus wax fat. Why should the State discourage patronage by also levying on the visitor? Why should he be "plucked" coming and going and when standing still? Why should extortion be practised on one class of citizens for the upkeep of the roads? Long before it became so apparent that automobilists were "soft marks," there were holes and loose stones and well worn ruts in New Jersey's macadam roads. Why was there then no outcry and no keen itching for "shaking down" the farmers and other drivers whose horse-drawn vehicles caused the ruts and holes?

In his address, Mr. Hotchkiss described the situation not only graphically but fairly. When he denounced the New Jersey law as "against principle, courtesy and self-interest," he told the truth plainly and in a very few words. It is a hold-up, practiced in legal guise, instead of with a mask and a shotgun. If such extortion as New Jersey practises is legal, two thoughts cannot but arise in the minds of men not versed in the statutes: First, What is the meaning of "public roads," of "freedom of travel' and of "equal and exact justice?" and, second, Is ours truly a union of States? If it is such a union, how is it possible for one State to exact an admission fee and require passports—for that is what the certificates amount to—from the residents of other States or to make the legitimate means of travel employed by one class the measure by which freedom of movement is to be judged?

Possibilities of the Worm Drive.

It is rather to be wondered at that no more attention is being paid by designers to the possibilities offered by the worm drive for final transmission of power in the shaft driven car. Especially in the case of the commercial vehicle, where slow running speeds demand a high driving ratio, and where smoothness of action and the elimination of as many working parts as possible is so much to be desired, the worm drive is particularly desirable.

It is true that the efficiency of the worm gear is usually considered low as compared with that of the spur and bevel types, but improvements in generating its faces, as well as the possibility of employing it to the best advantage in this connection, make it possible to employ it in such a way as to involve little more loss, if any at all, than occurs with the usual form of transmission. Briefly, with the use of the worm, it is possible to employ a "direct drive" to a more nearly universal extent than otherwise, thereby replacing two pairs of spur and one pair of bevel pinions with a single worm. The same improvements in design mentioned, have also done away to a great extent with the former tendency of the worm drive to "lock" when reversed, thus preventing the worm driven car from coasting freely.

It is one of the characteristics of the worm gear that the greater the speed ratio of its members and the more rapidly the driver is permitted to turn, the greater its efficiency. Furthermore, the worm drive is at all times the silent drive. This is not the case with gears of the spur type, as is testified by the use of rawhide and herringbone gears for the transmission of electric vehicles. The worm gear is subject to wear to perhaps a greater extent than the spur, even in its highest development, because its action partakes less of rolling and more of sliding motion than is the case with the other form. At the same time, the elimination of rattle and shock from the gear

Digitized by Google

teeth, and the uniformity of the drive obtainable, are points greatly in its favor.

At the present time there are two or three American commercial cars which are equipped with this form of transmission, and perhaps as many abroad, of which a notable example is the "mixed" omnibus system described in another column, in which the principle is applied in a particularly happy manner, it would appear. At all events, sufficient trial has been given the mechanism in its best form to prove it worthy of close scrutiny by the designer. Its possibilities are very promising, and it would hardly appear wise to overlook it wherever conditions warrant the adaptation of the high-speed motor to the slow-moving car.

Concerning the Front Drive.

Front actuation and front control of the motor vehicle is a proposition which unquestionably has been given too little consideration by motor car designers hitherto. For the pleasure vehicle it is true that results are obtained with the usual rear actuated and front controlled arrangement, which justify its continuance. But for the commercial vehicle, with the imperative necessity which is carries of making every foot-pound of energy developed at the motor produce as nearly as may be one foot-pound of work at the drivers, it is required that everything must be sacrificed to efficiency of the plant. Rear driving and front control involves a considerable waste of power whenever it becomes necessary to turn the vehicle from a straight course, furthermore there is every reason to believe that it develops a less perfect mastery of the machine than is possible where the drivers are also made the guiding wheels. Therefore the use of the front driving system, or the vehicle mounted on four driving wheels, seems the logical outcome of the motor traction enigma.

In the broad presentation of this subject which is outlined in another column, the real basis of advocacy of the front drive principle hinges about the turning of the machine from a straight course. If it is true that fully 95 per cent. of the average running of any machine is done in a straight line, as suggested, then it would appear at first that the present arrangement is as good as any which might be contrived, since it is well worked out and well proved in practice. Nevertheless it should be borne in mind that the subject of transmission and traction losses on curves is one which remains in its entirety to be investigated experimentally. Up to this time, all provision for turning has been based largely on theory, and the question of resistances has been for the most part adroitly side-stepped.

At all events, it would appear that for exact construction, either the drive should be applied to the front wheels, or to all four wheels if steering is done from both ends of the vehicle, or else that the control of the differential should be mechanical and governed by the steering gear, rather than left to compensate itself on the balance principle. It is safe to assume that in either event, the tendency to skidding would be largely overcome were such systems to come into vogue.

For the commercial vehicle, it is necessary to take into account all such fine points as these, which custom and its hurried development have elided in the pleasure vehicle. For the lighter types, it is unreasonable to suppose that present traditions are to be lightly overthrown unless it be found possible to combine this comparatively new ideal with existing forms at a minimum of trouble and expense. It is too late to expect radical alterations in automobile construction as the term is commonly understood. The budding development of the commercial car era, as it is sometimes fondly called, however, leaves ample time for the production of vehicles upon lines in close conformity to theory, and in this respect, it is not unlikely that this matter of adapting the driving relation to all possible variations in the course, is destined to receive considerable attention.

It is evident that the American public is not the only one which likes to be humbugged. The widespread interest in the so-called New York-Paris "race" is evidence of the fact. Every other man expects that the competing cars will be towed by horses or other automobiles, or be taken apart and transported in pieces in carts or on dog sleds, and yet they are at least half-willing to accept the venture as a race, whereas, if a pedestrian, or an equestrian, or a cyclist undertook a journey of the sort and resorted to such practices, he promptly would be denounced as a fraud and a faker by the very newspapers that are promoting the New York-Paris "automobile races." As adding to the gaiety of nations and providing material for a book of unusual travel, however, the enterprise is worth something. As a race, it is mere fudge.

It is understood that the New York Automobile Trade Association has abandoned the idea of a day parade, which had been talked of as one of the big features of the April carnival. The decision is a wise one. Of all "weedy," haphazard, uninteresting, unimpressive turnouts, it is unfortunately too true that a parade of motor cars heads the list. If, on the other hand, it is possible to promote a night parade and force the paraders to maintain a slow pace and to keep their distances, illuminations rendered possible by the car's own electrical apparatus may be made to present a novel and beautiful spectacle, that will be worth going miles to see. One impressive feature of the sort will be far more valuable than a series of minor popgun affairs. If the carnival is to be effective, it were well that the butter be not spread too thin.

COMING EVENTS

February 10-15, Detroit, Mich.—Tri-State Automobile and Sporting Goods Association's annual show in Light Guard armory

February 17-22, Cleveland Ohio—Cleveland Automobile Dealers' Association's show in Central armory.

February 21-29, Newark, N. J.—New Jersey Automobile and Motor Club's and New Jersey Automobile Trade Association's annual show.

February 22, Boston, Mass.—Bay State Automobile Association's 150 miles endurance run to Providence, Worcester and return.

February 24-29, Lincoln, Neb.—Dealers show in the Auditorium.

February 24-29, Portland, Me.—Annual show in the Auditorium.

February 25, Brooklyn, N. Y.—Long Island Automobile Club's 242 miles economy run to Montauk Point and return.

March 2-7, Ormond, Fla.—Annual beach carnival, under ausp ces Automobile Club of America.

March 2-8, San Francisco, Cal.—California Woman's Automobile Club's show in Coliseum.

March 7-14, Boston, Mass—Boston Automobile Dealers' Association's annual show in Mechanics Building and Horticultural Hall.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's sixth annual show in Convention Hall.

March 18-19, Savannah, Ga.—Savannah Automobile Club's stock chassis race.

NEW JERSEY'S NEW "SHAKE DOWN"

Fees Ascend Long Sliding Scale in Five Dollar Jumps—Fifty Cents "Admission Tickets" for Non-Residents.

Senator Joseph S. Frelinghuysen, whose automobile law has been in operation in New Jersey for a year, laid the plans for a larger "shake down" of automobilists in the Senate of that State's legislature last Monday night, 10th inst. Frelinghuysen, who is a lawyer and insurance counselor in New York City and a legislator in New Jersey, doubtless will see his name in print many times, as the amendments he introduced are designed to make larger dollars and many more of them drop into the State's coffers.

They consist of a sliding taxation of the vehicles based upon horsepower, from $3 to $100 per year, and a sliding scale for drivers' licenses, from $1 to $25. Senator Frelinghuysen also proposes to abolish manufacturers' licenses; to increase the number of paid inspectors from seven to ten, and the unpaid inspectors to twenty, with not more than two from each county; to change identification marks annually, and have the registrations and licenses expire on June 30th each year; to allow citizens of other States the special privilege of using New Jersey's roads for a limited time upon payment of a nominal fee, and to have all the revenue derived from automobilists apply to the various counties for the improvement of State highways.

These amendments to the State automobile law are not the only things that have kept Mr. Frelinghuysen busy. On the same day he introduced two separate amendments, that really are worthy of passage by the legislature. One is an amendment to the crimes act, making it a misdemeanor to place glass or any other cutting substance on a public highway, and also making it a misdemeanor for failure to return any fine collected under the automobile law, within thirty days. The other bill introduced by Mr. Frelinghuysen provides for a fine of $10 for any vehicle upon a county or other road without a light between sunset and sunrise.

The measure provides that the present number of paid inspectors be increased from seven to ten and to twenty unpaid inspectors, not more than two of the unpaid inspectors being from one county.

The registration fees are raised from the present rates of $3 for cars under 30 horsepower and $5 for those above 30 horsepower, to the following scale:

First class	1 to 10 h.p.	$3.00
Second class	11 to 20 h.p.	5.00
Third class	21 to 25 h.p.	10.00
Fourth class	26 to 35 h.p.	15.00
Fifth class	36 to 50 h.p.	20.00
Sixth class	51 to 70 h.p.	25.00
Seventh class	71 to 90 h.p.	35.00
Eighth class	90 to 100 h.p.	100.00

The drivers' license fees are raised from $1 for those driving cars of $30 horsepower and under, and $2 for those operating cars of more than 30 horsepower to the following scale:

First class	$1.00
Second class	2.00
Third class	3.00
Fourth class	4.00
Fifth class	5.00
Sixth class	10.00
Seventh class	15.00
Eighth class	25.00

Provision is made for a blanket license for licensing cab companies, operating adjacent to ferries, provision being made that they shall operate only one mile within the borders of the State.

It is proposed to abolish the manufacturers' blanket license.

Motorcycles are to be registered at a yearly fee of $2, and carry such identification marks as may be prescribed by the commissioner of motor vehicles.

All registration certificates shall hereafter expire on June 30, each year, and when certificates are issued for the fractional part of the year, only the fractional part of the fees shall be charged.

The provision also for non-residents' registration and license, fixes an admission ticket" good for six days or any multiple of that number of days, not exceeding thirty days, at a price of 50 cents per six days. It is provided that all identification marks both for residents and non-residents will hereafter be supplied by the State and be changed annually.

The receipts for all sources are to be so distributed by the commissioner of public roads that those counties that have improved roads by the county act shall receive their pro rata share with those that have been improved by the State road act.

Anti-Chain Rule to be Tested.

The first fruits of the New York Park Department's order, which prevents automobiles equipped with tire chains from using the park roadways, became apparent last Saturday when a driver of a taxicab was arrested for entering the park with a vehicle, the tires of which were furnished with this type of protection against skidding.

Meanwhile the Weed Chain Tire Grip Co., who are the makers of the bulg of these chains, evidently do not intend that their customers are to suffer if it can be helped. They purpose testing the legality of the new ordinance and publicly announce that they "stand ready to defend any automobilist arrested for an alleged violation of the Park Board ordinance, so long as we deem such defense necessary or advisable to demonstrate the invalidity of the ordinance."

Waco, Texas, is "agin" automobiles. At its last meeting the city council passed an ordinance restricting the speed of motorvehicles to 10 miles an hour in all the residential and business sections of the city.

MAYOR MAY STOP THE GRAFT

—Perhaps

Awakened to Prevalence of Joy Rides in City Vehicles—His Confidence in Official Honesty is Jarred.

It is barely possible that—for a time, at least—the extent of "joy riding" at the taxpayers' expense, and the conversion and misuse and abuse of their property may be curtailed in New York City.

The Motor World's series of articles, "Motor Cars as a Medium for Municipal Graft," aroused Mayor McClellan to a sense of conditions in New York, and as a result he has issued an order that his department officials are not to use the city-owned automobiles for private purposes or regard them as personal conveniences.

Two years ago the Board of Aldermen of New York passed an ordinance to the effect that all city owned automobiles must at all times carry a sign, prominently displayed, showing that the car was a municipal vehicle and indicating to what department it was assigned. Mayor McClellan, however, vetoed the bill, explaining that his officials all were men of honor to whom such a measure was unnecessary, as they did not and would not use city property save for city purposes!

What form of deterrent will be employed is not now known, but it is said that may be a central garage will be established where all city machines will be housed and and their outgoings and incomings recorded. The effect of such a system, however, largely will be dependent on the nature of the man who keeps the records.

It is possible—barely possible—also that the police department will be called upon to detail some of their detectives to watch officials who are suspected of "joy riding." The report of their investigations would make interesting reading, but what would happen to the detective who chanced to report the use of a city car by, say a mayor's closest appointee or by a secretary of a police commissioner is not difficult to surmise.

Oklahoma Fixes Stiff Figures.

Oklahoma is trying its hand at automobile legislation, and already the bill introduced by Representative Cope has passed the Assembly without amendment. The measure sets a maximum limit of 15 miles an hour in rural districts, ten miles in residential sections of towns and cities and an impossible five miles an hour in business portions. The use of automobiles will come high in the new State, too. The Cope bill requires that each car be registered annually at a fee of $10, and in addition the driver must secure license to operate the car, the fee for the latter being $5. No person under 18 years of age will be allowed to drive a car.

FORT DEFENDS NEW JERSEY LAWS

Advocates "Squeeze 'Em Again" Policy at Automobile Club Banquet—Hotchkiss Provokes Him to a Second Speech.

Diametrically opposite views regarding legislative regulation of motor vehicles on the public highways of New Jersey were presented at the annual dinner of the New Jersey Automobile and Motor Club, Newark, Thursday night last, 6th inst., by Governor J. Franklin Fort and Judge William H. Hotchkiss, president of the American Automobile Association. Although J. B. R. Smith, New Jersey's Commissioner of Motor Vehicles, and Charles Thaddeus Terry, chairman of the legislative committee of the American Automobile Association were among the speakers, Governor Fort and President Hotchkiss were hailed as "the" speakers of the evening. The former spoke twice, rising the second time in defense of the New Jersey statutes which had been "unmercifully" attacked by Judge Hotchkiss.

Governor Fort was introduced as a "just legislator and a friend of the automobilist." He expressed his high regard for motorists generally and the fascination he experienced in the sport they represented. He said he hadn't reached the "state of luxury" necessary to ownership of a car, but that during his recent campaign he covered 2,004 miles in an automobile in twenty days—without breaking the speed laws.

"I am a strong believer in the urgency of establishing a department for motor vehicles for two reasons," continued the governor. "In the first place, if the scheme I hope to put through meets with the approval of the people, a revenue will be derived from this department that will equal any revenue in the State, excepting that from corporations. I don't see any reason why autoists should not contribute at least $200,000, considering the benefit that would redound to them.

The speaker referred to the roads of New York State and told of the method of taxation by which they were made, and kept in repair. He spoke of the proposed method of taxing automobiles in New Jersey. In this particular he said that it mattered not to him whether motor cars were taxed on a basis of their respective horsepower or weight. In any event an increased license fee, such as has been proposed, would be an extra burden to the autoists, but he thought that it would cause no diminution in the ranks of automobile enthusiasts, but, by reason of better roads obtained, would increase the number, giving the automobile trade and automobilists superior advantages.

As to speeding inconsistent with the public safety, the Governor asserted that the law justly fixed the limitation, and he declared that violators of the speed laws should be summarily dealt with, adding that if it was in his power, he would help put any violator to a full experience of the discomfort of law breaking.

"Another thing," the speaker declared, "I think that every tire on the road should be taxed, and I am hopeful of bringing about—perhaps it won't be this year or next—the placing of such a tax upon every vehicle using the public highways. And then, too, no vehicle, automobile or carriage, should be allowed on the road at night without lights. This would be a hardship on no one and would result in greater protection to the driver than the pedestrian."

In something of an apologetic strain, Judge Hotchkiss prefaced his written speech. He did not disagree with Governor Fort in many things, but in automobile regulation he differed with him on many points. He responded to the toast "Jersey Justice," and in the course of his address denounced with no little asperity the present laws regulating drivers of motor vehicles, and especially the treatment accorded visiting motorists by New Jersey.

Judge Hotchkiss got facetious when he asked "What is wrong with Jersey justice, when applied to motor users, particularly those from other States?"

"Your people are not unlike ours," said the speaker. "Many of you pass the days in our metropolis; your streets, your municipal services, your buildings, your general laws are much the same; and to-night, this Lucullian board and this your generous hospitality—why, even New Yorkers could do no better, perhaps, not so well. More, as I stepped from the ferry and walked to the train to-day, I was not halted and asked whether I had registered and been tagged from Trenton, though the officer on guard must have guessed that I would, ere long, help wear out your sidewalks, be guided by the radiance of your street lights and enjoy the protection of your police. And yet, I was not stopped and numbered! Nor has any peace officer yet demanded that I execute a power of attorney to some unknown official over on the Delaware through whom New Jersey could retain jurisdiction of my body and property, in case I might heedlessly violate your laws or accidentally invade the rights of Jersey men. So for me, to-night, it's: Hoch to Jersey justice! For, gentlemen, let it be recorded that, on this day of grace, the sixth of February, nineteen hundred and eight, a New Yorker and a motorist boarded a ferry boat, with deliberate intent to use your streets and sidewalks and purloin from you, for a time, all those public services which make modern life so easy, and that, after using them as freely as the air he breathed, he is here in Newark to-night, unlicensed, untagged, unattorneyed—and still at large. You know the reason. Like tens of thousands more, in setting out for New Jersey, he left his automobile at home.

"And so I again ask: What's the matter with New Jersey in dealing with the motor car? Prejudice has existed in New York, rustic Dobbins still sometimes shy at the newfangled wagons, drastic ordinances have been passed, and weird laws enacted, and at times enforced. Yet, for nearly four years our motor vehicle law has proved so acceptable as not to require amendment—framed by motorists it was passed unanimously by a legislature dominated by the farmer vote—strangers are free to use our roads, without registration or tax; motor vehicle licenses, with us, are unheard of; accidents, save in congested territories, relatively rare; speed traps, except on the borders of the Greater City, all but unknown."

The speaker showed the difference in New Jersey, where the miles-per-hour speed clause is enforced literally, and told of a friend who made seven contributions one day last summer, and who vows henceforth to keep his purse out of New Jersey. Judge Hotchkiss seemed to think that the answer to the question "What is wrong with Jersey justice" is that there has been lack of cooperation between motorists, which has hindered the passage of laws that would be satisfactory to all users of the roads. Other reasons, he pointed out, were that the prejudice of the horse owner has not, as elsewhere, materially decreased, while the desire for revenue from "outlanders" seems to have become a settled fact in the State policy.

Judge Hotchkiss advocated a rational speed rule, by which speed would not be determined by a miles-per-hour clause, but by whether the operator in his driving endangered the life and limb or property of the public. He also asked who owned the roads, anyway, and answered the question by asserting that they belong to the State and as such should be maintained by the State and not by any particular class of individuals. "In advancing civilization the roads should be made to fit the traffic and not the traffic to fit the roads." The speaker closed his address by declaring that the present New Jersey law is "against principle, courtesy and self-interest."

In replying, Governor Fort said he didn't want the impression to be gained that he was in sympathy with the speaker's views. The Governor declared that if in disputes arising from violations of the speed laws the issue were left to a jury the accused "would have no show," while the fixing of a speed limit, he declared, resulted in fewer convictions for over-speeding than if left discretionary. As to the taxing of outsiders the Governor said that New Jersey was peculiarly situated, affording direct highway between New York and Philadelphia, while its coast resorts attracted touring parties from both States in greater numbers, with the result that Jersey roads were used almost as much by non-residents as by those who lived within its borders. They should contribute accordingly toward maintenance of the roads, he added.

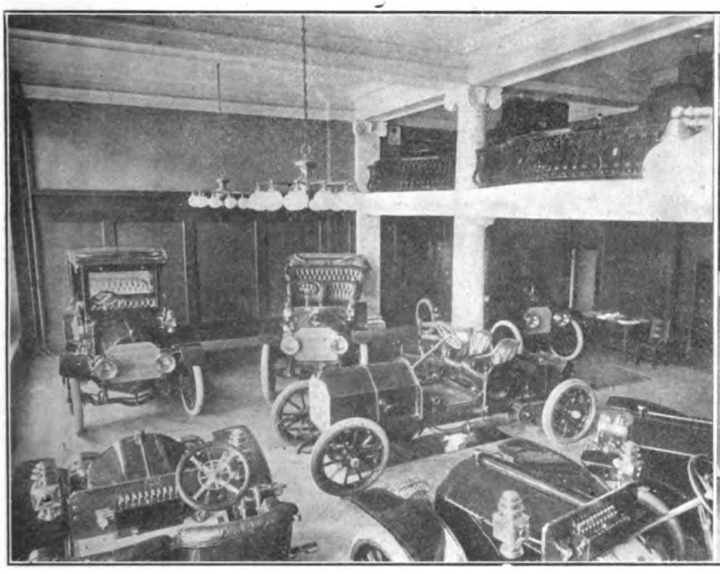
ONE MORE BROADWAY PALACE

Palmer & Singer's New Building and Its Equipment—Special Provisions to Prevent and Fight Fire.

With the opening of the Palmer & Singer building at 1620 Broadway, another impressive structure has been added to the "automobile palaces" that mark that famous New York thoroughfare.

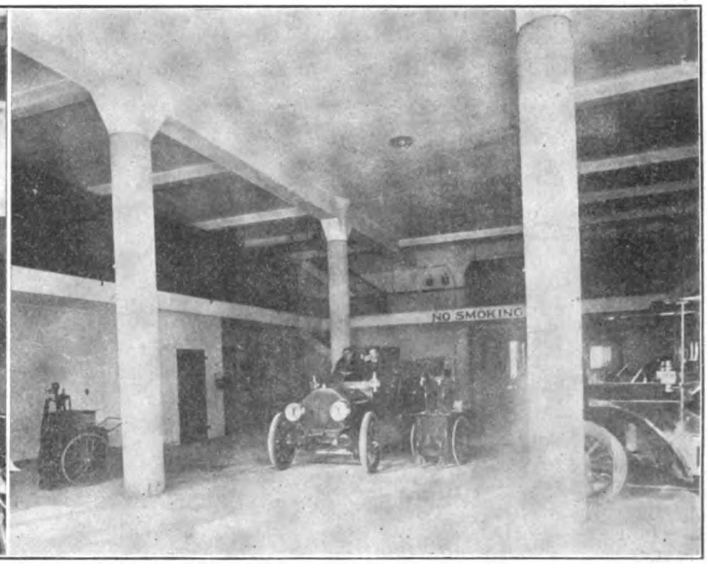
This Palmer & Singer establishment is five stories and basement, constructed of reinforced concrete. It occupies the entire plot running through to Seventh avenue, thus affording a frontage on both streets.

In designing the building, the architects had in view not merely the convenience of its occupants and the expeditious handling of its contents, but the safety of both. Unusual provisions have been made to render the structure proof against fire or to closely confine any fire that might occur.



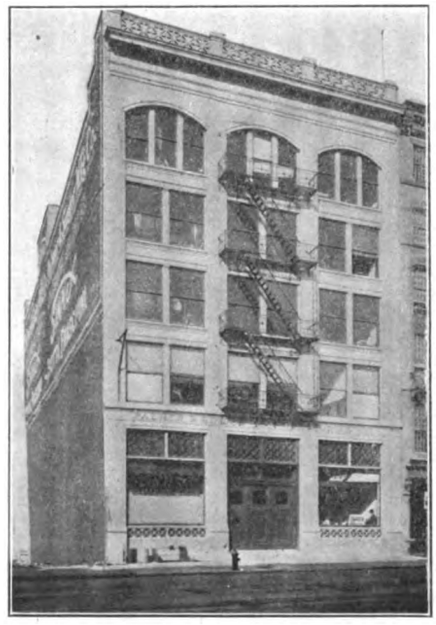
Throughout the entire building an elaborate system of standpipes with hose connections have been installed, the force for the water being obtained from powerful pumps in one of the cellar vaults. These pumps supply also tank of large capacity on the roof so that in case of a fire the water supply and the force behind it will be adequate for any necessity.

The elevators are many and commodious. No extreme care will be necessary to place a car in an exact position on them, as a generous allowance has been made, sufficient for any limousine or large touring car. In front of each elevator is a turntable so that cars may be easily handled without the extensive manipulation required where this important apparatus has not been installed.



The cellar comprises several vaults, each separate and walled off from the others. One contains the gasolene vaults, another the boiler room and power plant for elevators, etc., while a third compartment contains water pumps for the high pressure fire supply and roof tanks. In the cellar also are three pits over which cars may be run for simple repair work which can be done without resource to the shops above. The turntable and wash stands are also here close at hand to the immense elevators.

The main floor contains the salesroom where the 50 horsepower Simplex is to be shown together with the three cars of the Palmer & Singer line, the P. & S. four-forty, six-sixty, and a town car, also the Selden light touring car. The sales force will have their desks in this room behind which will be the garage with its entrance on Seventh avenue. Facilities are also provided for washing cars in the garage.



The mezzanine floor is arranged for the accommodation of the auditor, cashier and bookkeeper. The Seventh avenue end contains 150 lockers for chauffeurs and a platform for the use of the checkers who will note the incoming and outgoing of cars and record the movements on a time clock. On the floor above, the Broadway end is occupied by the executive offices. Back of these is more garage space, easily accessible by elevators. The Seventh avenue end is equipped for the comfort of the chauffeurs, with lounging and music rooms, pool tables, shower baths, a barber shop, card room and a bar serving "soft" drinks.

MAIN SALES ROOM

MAIN FLOOR, SEVENTH AVENUE SIDE

PALMER & SINGER BUILDING

The balance of the floor is reserved for the machine shop, where twenty cars may be repaired at the same time. The equipment is very complete, comprising lathes, speed drills, drill presses, milling machines, planers, grinders, buffers, etc., a forge and portable crane, the latter for use in removing engines, transmission and other heavy pieces. The shop contains four pits, and was designed that the greatest amount of light should be obtained. Twelve skylights covering almost the entire roof, materially assist this purpose. There are work benches and accommodations for the many men necessary to the rapid facilitating of the work.

The third floor is devoted entirely to storage, with a capacity of over 60 cars. This room, like all the others of its kind, is supplied with turntables and wash stands, and as it is intended that practically all the washing of cars is to be done here, the other garage floors must of necessity be dry. The fourth floor is also to be used exclusively for storage and covering, as it does, an area equal to the whole ground site, it affords in connection with the other space devoted to the same purpose, an area sufficient for the storage of an immense number of cars.

Prominent among the features of the fifth floor is a commodious drafting room

Digitized by Google

with every facility for the experimental work on new ideas that may be incorporated in the Palmer & Singer product. Adjacent to the draughtsmen's quarters is the stock room, where a complete line of parts will be constantly on hand to expedite the general repair work. There will also be on this floor a large and well equipped tool room.

Why Wooden Conduits are Unreliable.

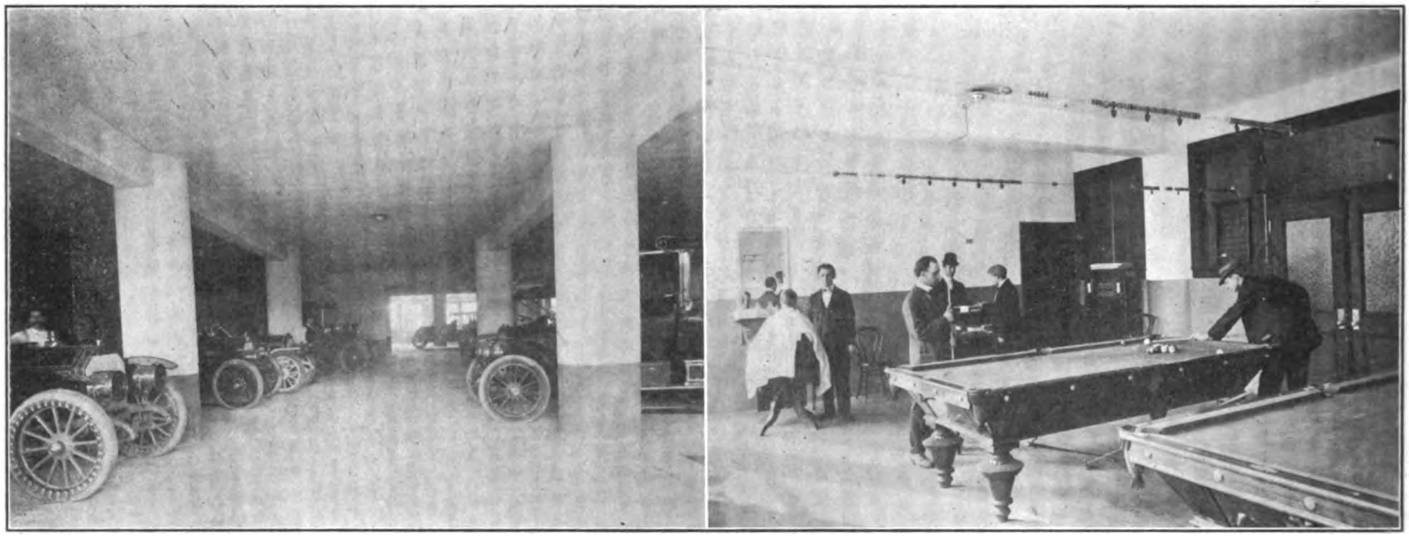
While it is not commonly the custom for the secondary wires to be contained in wooden boxes or troughs placed above the cylinders there are persons who still adhere to this form of conduit which was once general. Though wood in itself is a non-conductor when dry, when wet it furnishes an outlet for the high tension current that is responsible for short circuits with the accompanying misfiring that often prove a serious annoyance to drivers and cannot be readily discovered. Far better than the wood box is the fibre tube into which the four secondaries may be put or the smaller tube to contain only one wire, each of the leads having its own conduit, the fibre will not absorb moisture.

Care to be Exercised Before Cranking.

While it seems almost unnecessary to suggest to any one competent to drive a car that care should be taken to have the emergency brake set and the speed lever in a neutral position before cranking the engine, yet the frequent accounts of accidents caused by negligence in these matters are an evidence that many drivers fail to realize the importance of a simple precaution for their own safety. The habit of always looking at the control levers before starting is one easily acquired and when one realizes that small boys have a tendency to play with everything within their reach, the necessity of making sure of the position of the spark, throttle and speed controls is of prime importance.

DETROIT SEES ITS SECOND SHOW

Tri-State Association's Seventh Annual Exhibition Opened Brilliantly—Some New Comers Among Exhibitors.



Detroit this week is enjoying an automobile show—the second to be held there this season. The first was promoted by the Detroit Automobile Dealers' Association, and while the competition is felt, the present exhibition—the seventh annual of the Tri-State Association—makes a brave showing.

Although many well known cars were missing at the opening last Monday night, 10th inst., at the Light Guard armory, for the reason that they had staged at the previous show, several representative makes are much in evidence, among them being the Cadillac, Northern, Aerocar, Brush, Packard, Elmore, Pope-Waverly, Wayne, Oakland, and Reliance. Two new cars also make their appearance. The International Harvester Co.'s high wheeled buggy, although first exhibited at the State fair some months ago, was shown for the first time at an automobile show. The Regal, the newest Detroit product, also was displayed in both runabouts and touring models.

The show opened on Monday night with welcoming addresses by Governor Warner and Mayor Thompson in behalf of the State and city, respectively. The decorations are in maroon and white, and as the booths are uniform, harmony is maintained. The main floor has been given over to the car exhibitors, the gallery containing all the accessories exhibits. Motorcycles have the entire drill hall to themselves. The exhibitors showing cars are:

Cadillac Motor Car Co., Cadillac; Northern Motor Car Co., Northern; Aerocar Motor Co., Aerocar; Welch Motor Car Co., Welch; Crescent Motor Car Co.; Fee Electric Car Co.; Regal Auto Co., Regal; Oakland Motor Car Co., Oakland; Rapid Motor Car Co., Rapid; Brush Runabout Co., Brush; Blomstrom Mfg. Co., Blomstrom; Anderson Carriage Co., Detroit electric; Standard Automobile Co., Packard; Fee-Bock Auto Co., Elmore and Pope-Waverly; Motor Car Co., Cartercar; Wayne Auto Co., Wayne; Reliance Motor Car Co., Reliance; Jackson Automobile Co., Jackson; International Harvester Co., International Auto Buggy.

The other exhibitors are: Ajax-Grieb Rubber Co., C. M. Preston, Michigan Storage Battery Co., Diamond Rubber Co., Desmond Speedometer Co., Wildenpin Tire Co., Charles E. Miller, Gemmer Mfg. Co., Pittsburg Lamp & Bross Co., Michelin Tire Co., B. F. Goodrich Co., Morgan & Wright, Continental Caoutchouc Co., Jones Speedometer Co., C. F. Splitdorf, Goodyear Tire & Rubber Co., G & J Tire Co., Hartford Rubber Works Co., Heinze Coil Co., Norris Auto Co., Hibbard Engineering Co., Fisk Rubber Co., N. Y. & N. J. Lubricant Co., Perfection Non-Skid Climber Co., Witherbee Igniter Co., J. L. Gibney & Bro., Auto Igniter Co., Visor Knitting Co., Elastic Tire Filler Co., John H. Thompson & Co., Economy Cycle Co., Palm Engineering Co., Seitz & Co., F. Kicherer, Light Mfg. and Foundry Co., W. E. Metzger and Excelsior Supply Co.

THIRD FLOOR, STORAGE AND CHAUFFEUR'S ROOM IN PALMER & SINGER BUILDING

Device to Aid in Applying Tires.

Because it is deemed more difficult to apply a tire to the rim of a wheel when that rim is a demountable one, than when it is a fixture, a foreign inventor has lately devised a special form of tire manipulator consisting of a stand carrying a spider adapted to grasp the rim from within and hold it securely while the tube and casing are being applied. In addition to this, the fixture contains within the frame and attached to the spider, a three-cylinder air pump which may be actuated by rotating axle about which the spider is mounted.

CHAUFFEUR ON CHAUFFEUR STATUS

The Calling not Unsuited to Men of Refinement—Feminine Arrogance Blamable for Some Aspects.

Like the servant question, the chauffeur problem is always with us, and in many respects woman is as deeply at the bottom of the one question as she long has been at the other.

The status of the professional automobile driver is far from settled, in fact, the relative position of the chauffeur in the staff of employes or servants of the household is so far from being definitely fixed that the interesting question as to whether he ranks with the secretary, the valet or the coachman is one that must be answered, and by that answer will be largely decided what type of men are to be entrusted with the lives of family and friends and the care of an expensive vehicle which may easily be mishandled, or ever worse, permitted to be destroyed by failure to take proper care of its mechanism.

I have been a professional chauffeur and as such encountered the difficulties and drawbacks of the work, even as I experienced the delights of driving a car, and I stoutly maintain that I am honest, despite the assertion by a cut rate second hand automobile dealer that honesty is rare, if not indeed entirely absent from the makeup of men of the wheel. I have accepted the commissions offered by dealers from whom I have bought supplies and have in turn given them to the employer who paid the bills, but I can readily understand that this statement will not be believed by the seller or purchaser of second hand cars or supplies whose business would naturally bring him in contact with only that class of chauffeurs whose transactions proclaim them to belong to a type with which this article has little to do.

The question of what grade of men is ultimately to be considered as the typical chauffeur can be answered by saying that it depends on the treatment which they will receive; and that depends very largely on the position taken by madame.

I read the assertion of Price Cutter and Bargain Dispenser Froelich of the Times Square Automobile Co. in last week's Motor World, that "all chauffeurs are crooks," and I don't agree with him. Coming from Froelich I would not give the matter much thought and certainly would not break into print on a subject introduced from such a source, but as there are some good, substantial citizens who have expressed themselves on the chauffeur question in such a way as to show that they have come in contact with only a certain element of the professional drivers I am glad of the opportunity to take up the subject and suggest the other side of it, that side which treats of the capable, self respecting employe.

If chauffeurs as a class have a bad name, it is because of the notoriety given a few of their number, but it has not been thieving or dishonesty that has brought the disagreeable prominence. Generally their presence in courts was due to speed law violations, and their ill repute with a portion of the public is almost entirely because of selfishness in refusing to yield a right of way and their inexcusable retorts to persons who have insisted that highways are for general traffic instead of for the exclusive use of automobiles. I think any one will agree with me that the criminal courts hear more charges in which bankers, lawyers and clergymen are defendants than they do of chauffeurs accused of dishonesty; reckless driving may be criminal, but it is not dishonest.

Another thing that has helped to strengthen the opinion that drivers are an illiterate, uneducated species, is the custom of "smart" writers of stories in which chauffeurs figure to put into the latters' mouths words and phrases suggestive of the street gamin. They are made to say "Naw" for "No," "Whatcher" for "what are you" and hundreds of other solecisms which I have heard few of them use, and which I venture to say would be as unintelligible to them as the lingo of the hobo.

I grant that there are chauffeurs who are the outcasts of the race track and livery stable, but they are in the small minority. There are others—a great many of them—who are expert machinists, men who have served their apprenticeship in machine shops—careful, steady men, self respecting and competent, who prefer the outdoor life to confinement at the lathe or miller; they are not college men, but they have had a good grammar school education and are by no means dishonest or ruffians, or even "tough," and there is still another and smaller class, made up of college men, some of them even graduates. They are professional chauffeurs, because the work, in itself, is entirely congenial, and because the outdoor life and the feeling of control and of responsibility appeals to them. It affords chances for touring through the country and the pay is far better than can be secured in most office and store pursuits. Another thing that is responsible for the presence in the ranks of men who have had the advantages of an extensive education is some physical disability. I do not mean that broken down cripples or physical wrecks are driving automobiles, but I do mean that there are very many instances where the outdoor work is being done by men who are correcting or checking some slight lung or throat or nervous trouble, which outdoor life is the only means of remedying. I know also of cases of men who were fitting themselves for a profession, studying medicine and reading law, whose ambition was responsible for a too close application to books, which led to warnings from the occulist so much dreaded by the student. It meant an entire change of life, and what is better or more delightful than the seat behind a steering wheel? Is there any comparison between that and a life behind a desk or counter, which holds small promise, while the former affords an adequate remuneration and gives an opportunity for eyes or health to regain a condition that will permit of the resumption of studies? Is there any comparison between the close, foul air in a shop which so enervates as to sap one's vitality and make it impossible to perform even small effort at night, and the fresh air of the streets or country which exhilarates and makes possible a judicious use of the eyes when the day's work is done? Positively there is no comparison, and many refined and educated men have realized it while many more will do so; and the time will come when a tough element will be absolutely foreign to the ranks of professional chauffeurs.

Of course there are drawbacks which will affect the man of refinement. He does and always will refuse tips. He would prefer that they be not offered. The temptation to accept a five or ten dollar bill, and sometimes a twenty, is very great, but I know men who refuse it. They refuse it on principle, declining to be placed on the level with cab drivers, barbers and waiters. This type of man looks upon his work as being of a more or less confidential nature. He attends to many things for his employer which could not be entrusted to a valet, but which are not of sufficient importance to occupy the time of the secretary. He hears the private communications which take place in the car and appreciates that these confidential talks are possible only because the owner believes that his chauffeur can be relied upon. With an irresponsible driver this feeling of security is impossible.

It is true that a certain element are grafters. They do look for commissions and will deal only with firms who give them. Naturally these men have no interest in their employer's welfare and will buy an inferior article at a high price for the sake of the rake off to them in preference to purchasing a better grade that is sold at so low a figure as to make discounts impossible. A grafting chauffeur is a mighty expensive parasite. Not satisfied with commissions on things bought because of actual need he will create the need for the sake of more commissions. Tires are a means of an almost definite income. I know whereof I speak. When you see a chauffeur driving his machine on the car tracks, with a good highway right at hand, you can come mighty close to betting on a sure thing if you wager that he is trying to use up tires that he will replace by buying of a house that gives commissions. Why, I can name a place where they will give me $40 on every set I buy, and the tires are mighty poor ones, too. But this class of men is not

Digitized by Google

typical. Occasionally they are met with and they are usually so loud mouthed that you give ear to them and imagine that they are representative because by their noise they dominate. The quiet, self respecting chauffeur has none of these experiences that he can relate, and so is so seldom heard of that many do not know of his existence. too often when the chauffeur subject is discussed, the debate revolves around some low born rascal who has made a nuisance of himself and given an entirely false impression.

If employers would expect the drivers of their cars to be as neat and respectable as the clerks in their stores or offices, and would treat them with the consideration and respect that they show these clerks they would be taking a long step toward raising the standard of the men and one which would result in securing an enthusiastic and consciencious service with the result that repair bills and replacement charges would be so reduced that automobiling would cease to be an expensive luxury as is now the case when irresponsible drivers are employed.

The matter of wages is to be considered, too. Of course an inflexible rule cannot be adopted. The nearest to a standard that can be adopted which to my mind is equally fair to both parties would be to pay a man as much as he could earn in another business. Driving a motor car is not a profession; in fact, at this date it scarcely can be called a trade. There is no apprenticeship to be served, no long course to be studied. The competent chauffeur requires intelligence, some mechanical experience and native ingenuity and with these personal attributes he is not dependent on only the one class of work but can find a market for his ability in some pursuit other than that of driving an automobile. To pay $25 a week—the usual price in cities—to a person who could not get over $12 or $15 in any other work, is as absurd as it would be to pay the latter sum to a man who can earn $25 a week in some other work. Personally, I want to see the riff-raff driven out of the ranks and there's no better or quicker way of doing it than by paying just about the figure that the world puts on their ability.

Sometimes chauffeurs are heard comparing themselves with locomotive engineers, which is the sort of talk that makes a thinking man weary. Nobody ever saw a train in charge of an 18-year-old boy. The one job takes years of training, the other requires only the amount of a state's registration fee. Weed out the ignorant, grafting, undesirable element and you make room for the decent chap who is a desirable acquisition.

The most serious obstacle, however, to the educated man is the attitude of "milady." Invariably she insists that chauffeur and coachman are on the same plane. She wants her servants to be liveried—an impossible condition for the man of refinement. She wants him to act the part of the flunky; to touch his hat when she speaks and in all things to offer an outward sign of subservience. As a result she usually has a man who can steer the car, but who cannot make more than the simplest repair. When a puncture or blowout occurs, it means a drive on flat tires rather than to soil the white breeches and broadcloth uniform coat, and altogether the situation is absurd and incidentally impossible.

The time is not far distant when the better class of men are going to be in such demand that concessions will be made by many employers in the hope of enticing them into the field. When they succeed the restaurants and roadside inns will provide suitable accommodations for chauffeurs apart from the servants' quarters, and the man whose soiled hands and clothing make it impossible for him to mingle with the patrons of the place will yet find a niche where he can eat in peace and with dignity, which he cannot do at the tables reserved for cooks, hostlers, bootblacks, etc. The arrival of that period will be quickened when "the lady of the house" realizes that it is possible for a chauffeur to be as much of a gentleman as the man who tutors her children and treats him accordingly.

But to go back where I started: When I read Froelich's assertion that chauffeurs were "dirty, low and dishonest," I recalled a story of an old veterinary in the town I hail from, who one day prepared a powder for a sick horse and gave it to his new assistant to administer. The assistant asked how it was to be done, and the doctor gave him a large glass tube and told him to put the tube into the horse's mouth and blow the powder down his throat. A short time afterward there was a great commotion and the doctor rushed out to find his assistant in trouble.

"Where is that medicine?" he shouted. "What's the matter?"

The assistant coughed several times severely and then spluttered:

"The horse blew first." —M. R. L. C.

Why Some Tires are Selected.

"Oh, it's been a pretty good day for me, all right," said a loud mouthed chauffeur as he entered the chauffeur's room in the garage and removed a handsome fur coat that his employer had given him for Christmas, and after lighting a cigar, dropped into a comfortable chair. "I've done pretty well, I had to have a set of tires, so I went to a cut rate house. I looked at the tires and asked the 'bargain man' if they were good. They are not as well known as some other tires, but he said that they were all right so far as he knew, but he ducked when I suggested guarantee. 'They may be all right," he said; 'some last and some don't, but there's 40 per cent. in it for you if you take them; so I took $150 worth and pocketed $60 for mine, and that's only a starter, for the quicker they wear out the sooner I'll get some more."

"But how about your boss?" asked another. "It don't seem to me that he is getting a square deal on that sort of a tire."

"He can stand it," responded the grafter. "If he's got money enough to own a car he can afford to pay my commission, too. I'm looking out for my end and he can look out for his."

"Well, I call it a pretty rotten way to treat a decent man who gives you a $100 coat; besides there's the question of honesty in that sort of a transaction."

"Oh, hell!" ejaculated the first speaker, "What's $60? I know one fellow who got $1,400 for recommending a certain make of foreign car which his boss bought. He got caught and lost his job, but I'll lose mine for that price any day. A fellow can afford to loaf when he gets a lump like that."

Chauffeur-Actor as Elephant Legs.

Most men as a rule play many parts during their lives, sometimes of their own free will, frequently in deference to the dictates of necessity. Perhaps the greatest "Jekyll-hydeians" are actors, who frequently are called upon to double parts. It has remained for a chauffeur to attain the acme of versatility in this line, however. The driver of one of London's popular comedians was summoned at Litchfield on a charge of having driven his car without a rear light. He did not appear, but a letter was read from his employer, pleading as an excuse for his absence that he was engaged at the Theatre Royal, Manchester, " playing the part of the front legs of an elephant." While in England it is constantly advocated that chauffeurs should not limit their energies to the mere driving of their employers' cars—in fact, gardening, butlering, nursing and so on are prime requisites in a good chauffeur—still it would seem that the curriculum is somewhat extended to include the Thespian portrayal of the front legs of an elephant. It is feared that the whole of England's nursemen-chauffeurdom will be up in arms at the idea of one of its members gamboling about on the stage disguised as the anterior portion of a pachyderm.

Ready Bail for Prospective Prisoners.

Surety company bail bonds are to be available for members of the Long Island Automobile Club any time they may happen to be arrested for alleged violation of the speed law. The difficulty of securing bondsmen upon short notice and the consequent trouble that ensued caused this matter to be brought up before the club's board of governors at their last regular meeting. The governors decided to secure the bail bond, which will be furnished upon request of any member.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

BING!—THEY'RE OFF FOR PARIS

Immense Throng Sees Start of "Newspaper Race"—Snow Shoveling Begins on Very First Day.

No circus parade ever drew a greater concourse of people than did the start of the trip six automobiles may make from New York to Paris, from Times Square, New York City, yesterday, 12th inst. There is no way of computing the number that gathered at Forty-second street and Broadway and that lined the latter thoroughfare its entire length, to obtain a glimpse of the specially equipped and heavily laden cars, but the crowd surely was away up in the six figures. As an advertisement the affair was a great success and proved how many people will go to a little inconvenience for the privilege of seeing something for nothing.

The occasion was the start of what its promoters term an automobile "race" from New York to Paris, which originated in a French brain. It is more of a go-as-you-please any-old-thing sort of an affair, as although there is plenty of land between California and the Bering Straits, the contestants will embark on a boat from San Francisco to Valdez, Alaska, providing they reach the California city, of which there is considerable doubt. The rumor was afloat yesterday that the cars would be shipped to San Francisco by train, after leaving Chicago. This, however, could not be confirmed.

The police had considerable difficulty in holding the immense throng in check at Times Square. Several hundred automobiles were packed in the square, and side streets, but whoever had the parking in charge got beautifully mixed and as a result few people could locate the cars to which they had been assigned.

Mayor McClellan intended to fire the pistol to start the cars on their long trip, but somebody or other told the Mayor that affairs of this sort never start on time, and as a result the city's chief executive did not hurry through his morning bath. At 11 o'clock the Mayor had not appeared at the special grandstand erected on the Seventh avenue side of Times Square, so it was decided to wait for him fifteen minutes. As he was still missing at 11:15, Colgate Hoyt, president of the Automobile Club of America, fired the gun for the start, and the six specially equipped cars, and an escort of several hundred cars, many of them decorated with flags, proceeded up crowd-lined Broadway. The cars that started, and their occupants, were:

Thomas (American), Montague Roberts, driver; Harold Brinker and W. J. Henly.

Prothos (German), Ernst Maas, driver; Hans Knape and Lieut. H. Koeppen.

Brixia-Zust (Italian), Emilo Sirtori, driver; Henri Haaga and Antonio Scarfoglio.

Sizaire-Naudin (French), August Pons, driver; Maurice Berlhe and Lucien Dechamps.

Motobloc (French), Charles Godard, driver; Arthur Hue and R. Maurice Livier.

DeDion (French), Boursier St. Chaffray, driver, M. Austran and Capt. Hans Hansen.

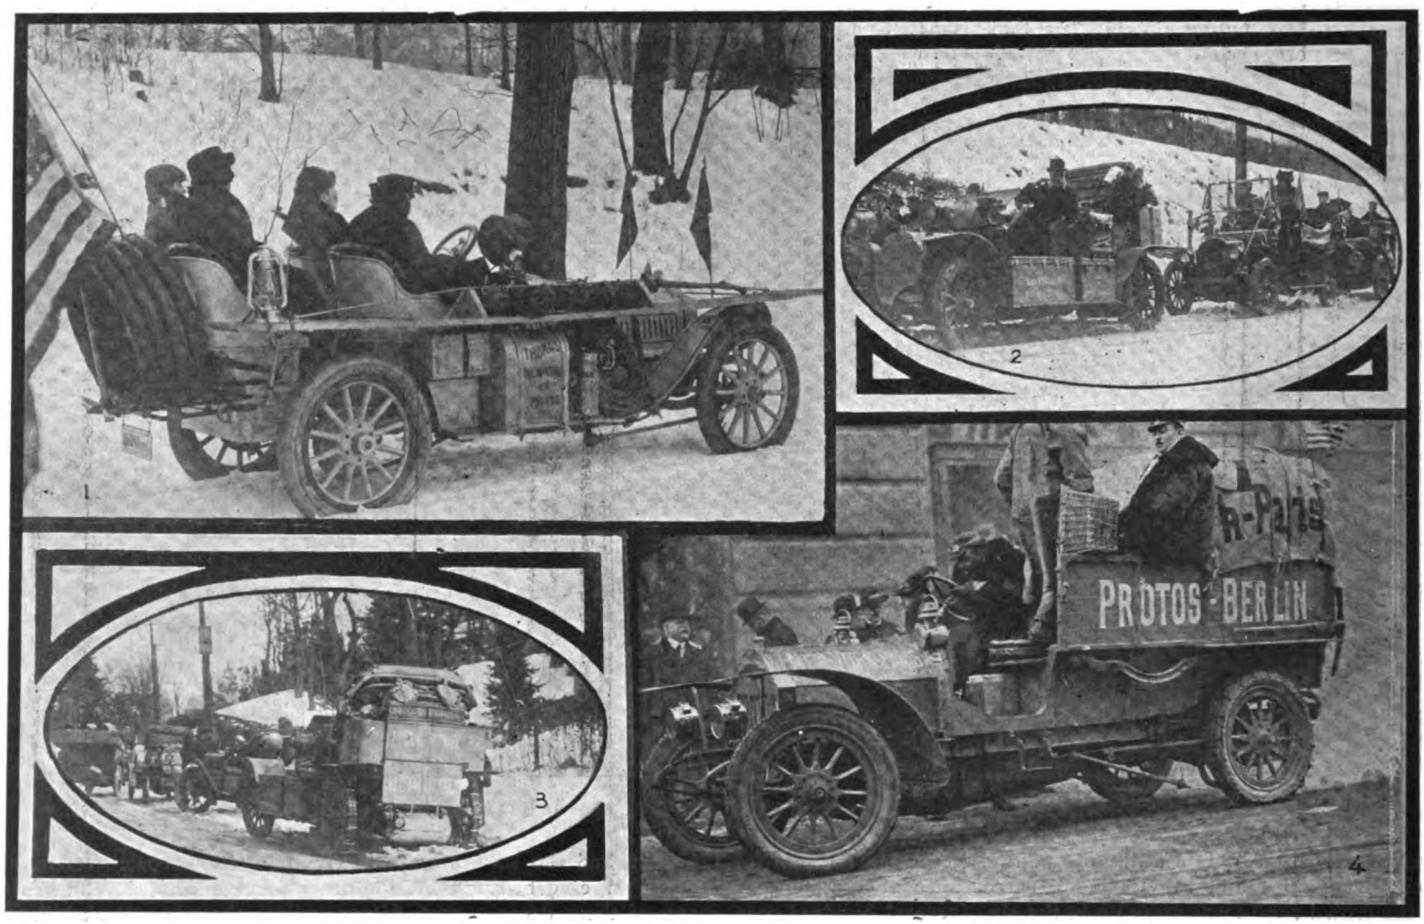
It was an imposing procession that paraded up Broadway. Crowds of people lined the streets and cheered the tourists while small boys threw snowballs. Montague Roberts, driver of the only American car in the contest, and from which trailed a large American flag, naturally received the greatest applause, while the De Dion crew, clad from head to foot in white fur, excited the most comment. It was the occupants of the escorting cars, however, who received the bombardment of snowballs.

Although it was arranged that the cars should reach Albany, 148 miles, before night, not one of them got that far on account of the snow that covered the roads. The Thomas, Zust and De Dion cars reached Hudson, 116 miles, where they stopped over night. Roberts, in the Thomas, was the first to arrive there at 8.20 p. m., followed an hour later by Sirtori, in the Zust. St. Chaffray checked in fifteen minutes after Sirtori. Maas, in the Prothos, decided to stay at Poughkeepsie over night, while the other two cars, left behind in the first fifteen miles, thought Peekskill, 44 miles, far enough for one half day's journey. All of the cars had trouble in the snow drifts, and only strenuous shoveling served to dig them out.

As the chances of any of the cars getting to San Francisco before the roses bloom are 100 to 1 against them, unless they go by railroad, it would seem that Godard and Pons, in charge respectively, of the Motobloc and the Sizaire-Naudin, have hit upon the right idea—to enjoy themselves while they may, by not rushing things. The crews of these two cars stopped at Dobbs Ferry for luncheon and spent more than three hours to feast and to allow a moving picture photographer, whom they are carrying with them, to expose many yards of film. The Frenchmen did not seem in any great hurry to leave the open fireside in the inn at which they stopped.

From general observation and scraps of conversation picked up from the occupants of the cars, it is plain that the foreigners do not begin to realize the magnitude of

START OF THE NEW YORK-PARIS "RACE" FROM TIMES SQUARE, NEW YORK



Digitized by Google

the task before them. They seem to think that the real journey will not begin until after they have crossed America and reach Alaska. They are possessed of the notion that roads in this country are not much worse than those in France. The gasolene tank on the Moto Bloc may be cited as an example of this ignorance of the foreigners regarding American highways. The tank is situated at the rear of the car, within six inches of the ground. The first big snow drift or sharp rock may show that it has been misplaced.

With the exception of the Thomas and the little single-cylinder Naudin, all the cars, with their elaborate equipment, labor under too much weight. The De Dion, loaded, weighs 6,600 pounds; the Zust, 3,520 pounds; the Prothos, 6,000 pounds; and the Moto Bloc, which seemed to have some difficulty in climbing several of the hills between New York City and Tarrytown, tips the scales at 6,325 pounds. What will happen to them if ever they reach the Rocky Mountains, does not make pleasant surmise. Included in the equipment of the last-named car are three cases of champagne.

All the cars carry rope, ladders, block and tackle, shovels and picks, which, perhaps, is a fortunate thing, as the snow encountered between New York and Tarrytown is nothing as compared to that which will cover the ground in the vicinity of Rochester, to say nothing of elsewhere.. Near Rochester the snow, wheel deep, covers the ground, so that the contest is likely to resolve into a shoveling match before New York State is left behind.

There are really two "races" from New York to Paris, via Alaska, under way. For on Tuesday afternoon, a Werner car left a newspaper office on Park Row, New York City, in charge of Eugene Le Louvier, but taking the unusual route by way of Philadelphia, Cincinnati, Kansas City, St. Louis, Cheyenne, Portland and Tacoma. It will attempt to beat the other six "racers" although it already seems practically out of the running. The car balked before it got on the ferry boat to transport it to Staten Island, and some of its mechanism went wrong five minutes after the ferry trip ended. After a stop of two hours and eight minutes it was persuaded to run into a grocery cart. Five stops for repairs were made between New Brunswick and Trenton and at 10.15 p. m. Tuesday it skidded into a snow drift at Tulleytown, Pa. It was still stuck in the drift at 2.15 a. m. Wednesday, when two touring cars came along and took turns towing it to Frankford. The three Frenchmen managed to get the car to Philadelphia by 5.30 o'clock and spent the rest of yesterday in bed. Their "death" is soon expected, but as "rebuilding" cars en route, or shipment entire by boat, or hauling by horses, or dissembling the cars and packing the parts in carts or on dog sleds, or any other old thing is permissible in "races" of this sort, there is no telling what may happen or what the "contenders" may or may not do.

1. THE LIGHTLY-LADEN THOMAS. 2 AND 3. THE MOTOBLOC STOPPED FOR LUNCHEON AT DOBBS' FERRY. 4. THE HEAVILY-LADEN PROTOS

San Antonio's Absurd Speed Limit.

San Antonio's (Texas) city council has passed an ordinance that "goes the limit" for absurdity. Because of the excellent streets and 185 miles of fine macadam leading out of the city some scorching is said to have developed, to break up which the council has passed an ordinance establishing speed limits of three miles an hour in the business section of the city, five miles an hour in the residence section and eight miles an hour in the suburbs. When turning a corner automobiles are required to slow down to two miles, while a fine of $200 may be imposed if the driver fails to stop on signal of a policeman.

Folwell President of the Quakers.

P. Donald Folwell was unanimously chosen president of the Quaker City Automobile Club, of Philadelphia, at its annual meeting last week. A. T. James was elected first vice-president; L. D. Berger, second vice-president, and A. T. Stewart, was re-elected treasurer. Harry C. Harbach was elected secretary.

REMOTE CHANCE TO REACH PARIS

Terrors of Route Told by Real Travelers—Cars May go Through, if Deer or Dogs are Available.

It has been interesting to follow the development of the plans of the New York-Paris race as they have appeared in print from day to day, says V. Steffannson, who was a member of the Anglo-American Arctic expedition. Af first the promoters were undecided between two promising routes—should the machines cross to the Pacific coast south of or near the Canadian boundary, then follow the coast northward to Skagway, Alaska, and proceed thence over the mountains to the Yukon at White Horse?—or should they go from Winnipeg to Edmonton and then across craggy ridge and wooded dale by the mounted police pack-horse trail to the Yukon? In either case they were to proceed "down the Yukon on the ice," and "across Bering Straits from Nome to East cape" (also on the ice). A good many highly diverting opinions on both schemes were secured by enterprising reporters from men whose official titles sound as if they should know more than they do about the north. A person of high political standing in Canada was said to "regard the Edmonton route as feasible," and one of the first men in the geological department in Washington was quoted (correctly?) as saying that "once on the tundra" the autos could get along without much trouble, for they would be able to go along on top the hard-packed snow!

The coastal route from Vancouver to Skagway was soonest abandoned. Perhaps some summer tourist had noticed the cliffs that alternately come perpendicularly to the sea or are covered to the water's edge with close standing, burly evergreen trees. Perhaps this tourist had even gone ashore; his experience may then have suggested to him that where a man in leggings squeezes between trees with difficulty, a six-cylinder car might have its troubles. As for the Edmonton route, a humorist did for that over-mountain scheme. He suggested (and a reporter took him seriously) that as the police trail was barely practicable for dog sleds and pack ponies, and was, beside, in many places too narrow for a machine, it would be best not to try following the trail, but to strike straight across country, making a bee line for Dawson. A man who has succeeded in having this opinion quoted seriously in a newspaper has therein sufficient cause to feel he has not lived in vain. Taking an automobile up the most pathless slope of Mount Washington would be a boulevard compared with crossing the forested ridges of the 2,000-mile wilderness that separates Edmonton from Dawson.

Both these startling wilderness-crossing projects weakened gradually and finally died a quiet death when the much advertising of the race began to bring the opinions of real travelers into the news offices where these routes had been laid out on the wall maps. The machines are expected to make San Francisco in about thirty days and to reach Valdez on the south coast of Alaska by steamer in late March or early April. Thence they are to go over the government mail trail north to Fairbanks on the Tanana, down the Tanana to the Yukon, down the Yukon to its mouth and thence over the land ice to St. Michaels and Nome. Even this plan, a thousand per cent. more sensible than the ones tentatively outlined at the start by the newspaper promoters of the race, will bear careful review.

The thirty day schedule across the continent can doubtless be maintained or bettered, and the late March sailings from San Francisco via Seattle are therefore likely to bring most or all the contestants to Valdez by the first week in April. Then comes the over-mountain trail to Fairbanks. The snow on it is usually so hard packed by much travel that it may be "negotiable" for machines, though one cannot help reflecting that the lighter and more readily dismemberable a machine is, the cheaper and easier it will be to freight it by horses or dogs if necessary. One is also prone to wonder (if one or more machines get to Paris finally) whether the several thousand-mile section of the journey from San Francisco to the made roads of Siberia will have been an automobile race at all, or merely a contest in shipping dismembered engines over swamp and sea.

But granting that the machines could get over the trail to Fairbanks, it may seem on paper as if most of their difficulties in reaching Nome were over. "And thence on the ice of the Tanana and Yukon rivers to Nome," looks feasible enough when you read it in your morning paper at breakfast.

But the trouble is this: It is seldom that any considerable stretch of one of the great northern rivers freezes smooth. The Indian sleds that follow the Mackenzie travel less on the ice than along the banks, for the surface of the stream is not smooth and even, but is jagged as the broken bottles on top of an English stone wall. In the fall the stream has frozen half an inch or two inches thick; then this thin ice has been broken into a jumble of cakes that tilt on edge and again freeze in that position. The Yukon is often heaped and piled so rough that the crossing of it from one bank to the opposite is a serious problem even with a dog sled, while the winter trails along it frequently go over the hills and seldom along the middle of the river. The machines will, therefore, be no less dependent on the made trail after reaching Fairbanks than before.

Having in anticipation brought his machines to Nome, the newspaper program writer tells us that the machines will "run across on the ice" to East Cape, Siberia, if they get "to Nome early enough in the season" (or, as he explains, by May 5 or 10). It seems a bit strange that all the Arctic literature which books, magazines and newspapers have spread over the country cannot get out of the public mind the idea that the Arctic seas are solidly frozen out in winter. So far north as human being have as yet been the winter ice field is broken into floes separated by strips of open water by even slight storms, be it midwinter or early spring, and whatever the temperature. But stranger still than the notion that the winter sea ice stretches solidly from shore to shore, is the idea that its surface is smooth after the manner of the Boston frog pond in January. Let people who think so read the records of any Arctic traveler from Parry to Peary. Or, seeing Alaskan seas are out of the question, let them glance at the story and published photographs of the Anglo-American Polar expedition. A heap of new blasted rock in a granite quarry is smooth compared with the surface of portions of the Alaskan seas, where blocks of ice rise on edge like the stone gables of ruined cathedrals. And as strange as either of these two ideas is, the third one that must be in the heads of those who plan automobiling over sea ice—that the snow on the ice is hard. It is hard in drifts, but between are areas where a man walking without snow shoes would sink to the knees at every step.

But all this talk about the racers crossing Bering Straits on the ice may have no other serious purpose than to make the trip seem more romantic to the stay-at-home. The season will not only be "too late" when they reach Nome (if they do), but it is scarcely conceivable, as the spring thaws will not allow them to get beyond Fairbanks on either ice or snow trail. If this place is reached before the beginning of the "break-up," that part of the valor which is high "discretion" will prompt the racers to stay till the ice is out of the rivers and the Tanana and Yukon steamers can take them to Nome. There they may take ship for East Cape (should not wisdom ere then make it clear to them they had better land at some more southern and more civilized port on the east coast of Asia).

The writer's personal experience, and his collection of photographs to back that experience, do not extend to Siberia. But he has friends who have walked over the Siberian "tundra" (which he has not seen) and over the American "barrens" (which he has not seen). These friends say that the "tundra" and the "barrens" are both in summer and winter much alike. The following things are true, then, of both.

The snow which covers the ground in winter is in occasional places drifted hard enough to bear a man's weight; in spots it might even bear up an automobile. But no more in the Arctic than on the Dakota prairie can one go many rods before coming to a softer area when even dog sleds and men on snow shoes will sink in to some extent. In these places a man without snow shoes will go in to the ankles or waist (ac-

Digitized by Google

cording to circumstances); what would happen to an automobile on wheels is not doubtful. One may safely smile a bit at the manufacturer who is going to equip his machine with "eight-inch tire rims to enable it to keep on top of the snow!"

The Russian general, Linnevitch, has written an article on the feasibility of the Siberian part of the race. One reads the cabled summary of this discussion with growing wonder, for he apparently makes light of the gravest difficulties. A thousand mile stretch of uninhabited snow waste is, apparently, not formidable in his eyes, and one begins to feel it no great wonder that the Slavic mind (if generally so sanguine), occasionally misplans a Siberian military campaign. But toward the end of the article comes a statement which raises the general's good sense considerably in one's esteem. His thesis, after all, is merely that if the machines get to Siberia after having conquered the difficult Yukon valley and Bering Straits, they will be equally able to master the more difficult Siberian 1,200 miles that lead to Nijni Kolimsk. He does not, therefore, commit himself at all on the whole project, but merely says if the one can be done, so can the other. And at the very end is a statement which places the Russian general in a class with our own Mark Twain. The substance of it is that the journey from East Cape to Nijni Kolimsk presents no insuperable difficulties to machines that can be dismembered into parts light enough to transport on deer and dog sleds. And even this the cautious soldier qualifies by putting in a "provided the deer or dogs can be secured."

But if this journey to Nijni Kolimsk is to be made not in winter but in summer, it is interesting to remember that in summer the typical tundra is covered with a network of lakes from the melting snow. That part of the surface not covered with matz is mossy—not comparatively smooth, but hummocky with the so-called "nigger heads." Besides being rough, the surface has the moist softness of a wet sponge, and is a pretty continuous bog where the frost thaws out. To add to the poignancy of the racers' experience (if, again, they get this far) will be the Siberian mosquitoes. All the gathered hosts of New Jersey are a faint reminiscence to one who has encountered the winged clouds of bloodthirsty insects that hang like a fog over these northern swamps.

It would be foolish to say it is impossible to take an automobile from New York to Paris approximately along the route at present outlined for the contest; Cleopatra's needle could conceivably be freighted through the same country. What seems fairly safe betting is that none of the machines will, under their own power and on their own wheels, cover any considerable part of the thousands of miles that separate San Francisco from Nijni Kolimsk and the first made roads of Russian Asia.

Personnel of the Racing Board.

Because, in the words of Secretary Elliott, of the American Automobile Association, "it is considered that the time has come when racing matters should be directed not entirely by amateur sportsmen appointed from the various clubs," the Racing Board of that organization hereafter will closely resemble a trade directory.

With the representatives of the trade who just have been made members. the full roster of the board now is as follows: Chairman, Jefferson De Mont Thompson, New York; vice-chairman, Frank G. Webb, Brooklyn; William K. Vanderbilt, Jr., Dave Hennen Morris, S. M. Butler, H. Rossiter Worthington, Alfred Reeves, Percy Owen, A. G. Batchelder and S. A. Miles, all of New York City; A. E. Pardington, Brooklyn; Charles J. Swain, Philadelphia; H. L. Bowden, Harry W. Knights and L. R. Speare, Boston; Benjamin Briscoe. Tarrytown; A. L. Riker, Bridgeport; R. Lincoln Lippitt, Providence; J. J. Mann, Paris; E. R. Thomas, Buffalo; S. L. Haynes, Springfield; George L. Weiss, Harry H. Knowles and Thomas Henderson, Cleveland; A. B. Lambert, St. Louis; George G. Greenberg and I. M. Cobe, Chicago; H. A. Bonnell, Newark, N. J.; Henry Ford, Detroit, and Asa Paine, Minneapolis.

AUTOFOID

This material is on the market in the following styles:

Single ply—leather faced on one side.
Single ply—leather faced on both sides.
Double ply—leather faced on one side.
Double ply—leather faced on both sides.
Double ply—leather faced on one side, whip cord back.
Double ply—leather faced on one side, Broadcloth back.
Double ply—leather faced on one side, Silk Mohair back.
Double ply—leather faced on one side, Sicilian back.
Double ply—leather faced on one side, Felt back.
Double ply—leather faced on one side, Silk Armure back.
Single ply—leather faced on both sides, one side being made up with mackintosh effects.

AUTOFOID can be found in any color desirable.

FRONT DRIVING AND STEERING

Views of Two Well Known Experts on an Important Problem—Its Bearing on Power Economy and Control.

So firmly rooted are the ideas governing present methods of automobile design, that it is almost impossible to conceive of an upheaval taking place of sufficient magnitude to introduce to anything like a universal extent the system of front wheel driving and steering. Yet there are many considerations of a purely theoretical nature which point to such a change as being ideal, chiefly because with the propelling force applied directly in connection with the steering action, the tendency to skidding and unmanageability in deep mud or snow would be largely eliminated.

At the January meeting of the British Institution of Automobile Engineers, a symposium of this absorbing topic was presented by Dr. Hele-Shaw, inventor of the clutch which bears his name, and a well-known scientist, and R. W. Harvey Bailey, an engineer who has been closely associated with experiments in front driving for a number of years. Several systems of front driving are in vogue at the present time, both here and abroad, but it is safe to assume that the average motorist has little or no comprehension of the soundness of theory upon which they are based. Historically, the front driven vehicle is very old. Says Mr. Bailey in this connection:

"As a matter of fact, the first steam vehicle, built in 1769 by Cugnot, was a three-wheeler, driving and steering on a single front wheel, while the first vehicle Hancock built was on the same lines exactly.

"Again, in 1862, we find Pattison in evidence with his combined front driving and steering four-wheeler, whilst in our own day, in 1895 and 1896 Messrs. Thornycroft made their first attempt at road locomotion with a vehicle that drove the front wheels, but steered by means of the rear wheels."

Probably, as he explains, the earlier attempts at front driving were instigated largely on account of the use of the three-wheeled vehicle and the, then serious, difficulty of providing for differential action in turning corners, existing where two wheels were used in propulsion. All more recent attempts in the same line he ascribes to another trouble—universally prevalent, and "generally called 'skidding.'" While this may be, and frequently is, the result of bad driving, the author states it as his experience based on trials with both types, that basically it is an inherent trouble with the system of propulsion. When a car of the ordinary type is placed upon a turn, a difficulty arises which he explains as follows:

"It is at once clear that the force propelling the vehicle is, in a rear driver, parallel in its direction to the center line of the car, whereas the front wheels are set at an angle to this direction, varying to suit the exigencies of the moment.

"Analyzing the forces which are brought into action at the moment when an attempt to turn is made, it is plain that the car itself will only follow the curve as set out by the position of the rear wheels, because these lay out a curve of least resistance, resulting from the fact that the wheels are vastly easier to revolve on their axis than they are to slide bodily sideways.

"Although this is generally true, it is not always so; and as the resolved force along the direction of the turn becomes less, the greater the angle of deflection becomes, there comes a time when, if the roads are greasy, the resolved force is too small to act upon the vehicle and alter its direction, because the reaction of the road on the wheel caused by the propelling force is itself too small to prevent the wheel sliding bodily forward in the direction of the propeling force. This, then, is obviously one serious defect in the rear-driving car."

Front driven vehicles he divides into two general classes, as those in which the steering is done from the rear, and those in which the driving and steering are performed simultaneously from the front. The former he dismisses at some length and for reasons already well known to those who have had experience with vehicles of the type of the electric cab species at one time so common in New York City service, for instance. Of the second class, he points out that "a very slight consideration of the conditions shows that, whether running straight or making a turn, since the steering wheels are also the tractors or drivers, it is plain that in this type at least since the propelling forces are always in the proposed line of travel, that here is a design which is mechanically correct, as the propulsive force tends to stability, being never predisposed to skidding."

Regarding the method of gasolene propulsion as applied to front driving and steering, he remarks that it is often subject to adverse criticism because of the great loss of power supposed to entail upon the use of the universal joint mechanism in the driving shaft.

"This notion is based upon the misconception that it is often working on a big lock, whereas, as a matter of fact, almost 95 per cent. of the driving is such that the joint is only a loose coupling in a practically straight length of shaft and as such, of course, has no movement in its individual parts; hence it cannot, while so acting, be a source of loss," he explains.

"There is, of course, a fairly large loss of power when the vehicle is turning on full lock (50 degrees), but even then the front driver would compare favorably with a rear driver on the same lock, because in the front driver the loss of power through the joint is more than compensated for in the fact that the front driver exerts its energy in the direction of required motion, while a rear driver exerts its forces in a direction inclined at 50 degrees to the desired direction. . . . .

"Considering, finally, the benefits of the system, first and foremost stands the fact that front driving and steering vehicles are non-skidding—not that the author would mean that taking corners at full speed they will not skid, but that under ordinary fair usage they are non-skidding.

"It is only a question of grip in relation to the centrifugal force in such a case as above referred to, and it is obvious that making the speed high enough anything will fly outwards from its path; but even then—and this requires emphasizing—the act of turning the wheels, since these are drivers, will admit of some control, even under such circumstances."

Another phase of the matter is brought up by Dr. Hele-Shaw, who refers to front and rear braking—a subject which has recently been aired to a considerable extent in British motoring circles. "It is easy to see that so long as the vehicle is being propelled by the front wheels, the vehicle as a whole will only follow the tracks of the front wheels, and would not be inclined to skid," he says, "that is, assuming the back wheels to run easily; but it is not so easy to understand what happens when the brake is applied to the front wheels.

"It looks at first as if the free-running back wheels and most of the weight behind would tend to over-run the front wheels and slew round the vehicle, causing what is commonly known as a side-slip. On looking, however, into the matter a little more closely we see that the difference between the cases when india rubber and pneumatic tired wheels are free running and with the brake applied should be taken into account. It only needs simple experiment to demonstrate the fact that whereas a wheel of this kind when free running tends to move most easily in the direction of its plane of rotation, when the brake is applied the exact opposite is the case, and it is much easier for a wheel on a greasy surface to slip sideways than to move forward in its own plane. We therefore have this result, that if the brake is applied on the front wheels, any tendency to slip may be checked by the driver adroitly using his steering wheel, the hind wheels which are free running following in the direction of the vehicle, without any tendency for the mass of the vehicle to swerve sideways. If, however, instead of the front wheels being braked, the brake is applied to the back wheels, it becomes an extremely difficult thing to prevent side-slip taking place, unless non-skid devices are used, even by skilful manipulation in steering the front wheels."

As to the comparative controlability of front and rear driven vehicles, he refers to several tests of his own recently carried out with a British front driven electric vehicle and another vehicle of practically the same

Digitized by Google

specifications, but rear driven. While crossing a patch of artificial mud, it was found that the front driven machine held its course every time, while the rear driven one manifested a decided tendency to swerve. When an attempt was made to alter the course of either vehicle on the greasy patch, it was found that it became more or less uncontrolable. A subsequent trial of the front driven machine made by altering the weight distribution over the front and rear axles, developed the fact that as the weight on the front wheels was proportionately diminished, the controlability of the vehicle was correspondingly decreased. The well known performance of the Christie car is an example bearing out the same theory.

The principal advantages of the electric and hydraulic systems in contradistinction to gasolene and steam, are, as he explains, that they are directly applicable to the driving wheels, as is done with the American Couple-Gear vehicles, thus concentrating the power plant and simplifying the mechanism to a most desirable extent. Naturally, such systems are not applicable to light and swiftly moving vehicles of the pleasure type, as at present constructed, though several attempts are being made abroad to introduce fore carriages in machines of the town car type.

To Avoid Misleading Ammeter Tests.

While it is an excellent plan to test ignition dry-cells frequently in order to keep track of their performance and ensure long life, it is well to make sure that the observations are made with a reliable instrument. With many of the cheaper grades of ammeter which are sold for battery testing, the tendency is for the reading to become higher than it should be after some little service has been seen, with the result that the batteries under test appear to be giving from two to four times as much current as is actually the case. This fact may account for some of the many tales which are heard of the sudden failure of batteries which up to the last have continued to give a high amperage. The test, of course, is useless unless the instrument is correct. On this account it is well to test the batteries occasionally by leading temporary wires from a switchboard instrument, which is apt to be pretty nearly standard, afterward checking the portable instrument by taking a second reading from the same batteries.

Speed Indicator in Compact Form.

A new speed indicator which has just been brought out in England takes the form of a tiny magneto, mounted on the axle of the car and driven directly. The indicating device, which is merely a miniature voltmeter graduated to read in miles per hour, is carried on the dashboard, and also includes an odometer of the ordinary mechanical type. The voltmeter wires and the driving shaft of the odometer are enclosed in a single flexible casing.

FOR ADJUSTMENT OF THE TIMING

Simple Attachment Adapted to the Use of the Inexperienced—How It is to be Employed.

To many drivers the possibility of some time being called upon to time the valves or ignition of the motor without any advice or help from more experienced sources, exists as a very real bugaboo. To obviate any difficulty on this score, a London supply house recently brought out a timing device which is wonderfully simple and, granted that the method of timing upon which it is based is one which is applicable to the average motor, should entirely remove my fears of disaster which the inexperienced engineman may entertain. In a word, the device consists of a small metallic disc which may be clamped to the clutch, fly wheel or some other moving part of the motor turning in synchronism with the crank shaft, and upon which are indicated the points on which the valves are to open and the ignitor circuit to close. The proper point is in every case located by means of a spirit level which gives an absolutely correct setting, provided the instrument has been properly adjusted in the beginning.

In order to adjust the timing of the valves, for instance, all that is necessary is to turn over the crank shaft until the piston has reached the top of its stroke and then clamp the device in place, turning it so that the level is horizontal, and an arm to which it is connected registers with a point on the dial of the device which is marked zero. To facilitate this and the subsequent operations, the dial is perforated at the proper points, and a pin carried by the arm is made to fit into the holes in turn, thus locating the position of the level absolutely in every case. The pin and arm are then turned to the point marked "open" on the exhaust circle, and the crank shaft is revolved until the level again balances horizontally. The mere act of balancing the level is sufficient to bring the piston to the proper position. After setting the piston in this way, all that is required is to set the valves to open or close at that point.

Three sets of perforations are placed on the dial in as many circles, the outer one applying only to the timing of the exhaust valve, the inner to the ignition setting, and the middle one to the setting of the inlet valves. The perforations relating to the ignition system are two in number, and refer to the location of the point of maximum retard for high tension magneto and jump spark systems, respectively, while for the low tension magneto system, the hole marked zero, is employed.

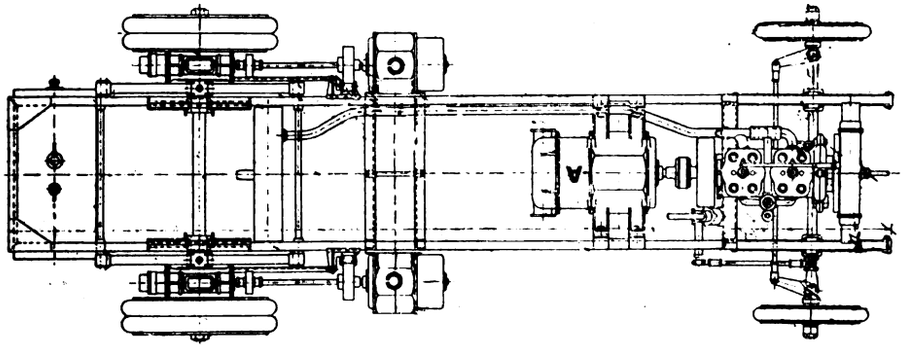
By following the settings laid out by the perforations, only one method of timing is obtainable, it will be observed. This is according to a design of the inventor's and allows for early exhaust opening and late closing both of exhaust and inlet, while for a period of about 5 degrees at the beginning of the suction stroke, both the inlet and exhaust valves are open. Out of deference to those who prefer their own settings to this, as well as to permit of comparing the adjustment of the valves in all the cylinders of a multi-cylinder motor, a second and interchangeable dial is provided which, unlike the first, is without perforations, but instead is divided into degrees on one side, and percentages of the circle on the other. By using this arrangement, it is possible to obtain any system of timing exactly as laid out in a chart.

Raising the Limit of Compression.

It has been supposed for several years that the practical limit of compression pressures for internal combustion motors of the common type was somewhere about 80 pounds per square inch. That improvements in design may ultimately raise this limit, was shown by the results of a series of experiments conducted by Professor Burstall of Birmingham University, England, who succeeded in making successful tests at more than double what is usually considered the limit of compression pressure.

Fully two years were consumed in the research of which this was the conclusion, the broad purpose of which was to discover the relation between initial compression and heat efficiency. Considerable alteration of the engine under test was one of the incidental complications to the investigation. Special ignition apparatus also was required to withstand the tendency to preignition, and many unsuccessful trials were essayed before it was found possible to run the compression above 140 pounds. When finally the motor was got into working shape it was found that it did its best work when running at 175 pounds compression. A thermal efficiency of 43 per cent. was developed under these conditions, which is as high as has yet been attained by any motor with the single exception of the Diesel machine which runs upon a specially modified cycle. The results though instructive in a general way, have no present application to automobile practice, beyond showing the existing possibilities.

Grounding the Plug Wire.



When for any reason it becomes necessary to run the motor with one or more of the spark plug terminals disconnected, care should be taken to ground them positively against the cylinders or some other metallic part of the machine. Otherwise the full voltage of the secondary current will be discharged through the infinite resistance of the air, and the chances of breaking down the insulation of the coil will be very great. Removing the plug wire altogether inflicts upon the coil affected the worst possible strain to which it can be subjected.

WORM GEAR IN INDFPENDENT DRIVE

Practical Features of Twin Motor "Mixed" System in New Omnibus—Simple Methods of Control.

Mixed systems of auto-propulsion are multiplying with great rapidity, and it would appear that with each new comer, some commendably ingenious device is brought out. Thus, in the case of the new Hallford omnibuses, which just have made their appearance in London, the unique feature consists in the use of a special form of independent drive for each of the rear wheels. Instead of the common arrangement of the motors with their axes parallel to those of the driving wheels, they are arranged longitudinally

of the car, bolted to the outside of the frame side members, and driving through cardan shafts and worm gearing.

The layout of the power plant and transmission is seen in the accompanying plan view, in which A, is the generator, directly connected to the gasolene engine mounted vertically at the fore part of the chassis, while C-C are the two motors, each of which drives its own wheel through a suitable cardan shaft and worm gearing. In this connection it is interesting to note that the worms instead of being mounted in fixed relation to the wheels, are carried on independent ball bearings, and transmit their power to the wheels through jaw clutches, which permit a certain amount of freedom of movement and allow the worms to seek their own alignment with the gears, irrespective of any possible distorsion of the wheels and axles, also relieving them of all shock. Just back of each motor is mounted a small band brake. The gear reduction in the worms is 12 to 1, so that the motors run as high as 1,200 revolutions per minute. Consequently the brakes, which are interconnected and balanced, are very powerful.

The gasolene engine is of conventional pattern and rated at 30 horsepower. The electric generator to which it is connected is mounted directly in the chassis frame, and is of the "interpolar" type, that is to say, it is provided with two sets of field windings, one of which is in shunt and the other in series. This arrangement, while intended primarily to prevent sparking at the commutator, also is of value in that it permits the machine to pick up its load on closed circuit when starting the vehicle from rest.

The control system is based on altering the excitation of the dynamo, by passing the field current through suitable resistances. In this way no great proportion of the energy of the gasolene motor is lost in heating resistances, and the driver's mastery of the vehicle is in no way impaired. In addition to this, provision is made for operating the motors either in parallel or series. Speed control is therefore obtained in two ways, that is to say, by varying the current strength in the generator, or by accelerating the engine.

For stopping, a foot-operated electric cutout is employed, and this is so placed on the right of the foot board that in order to reach it the operator must remove his foot from the engine accelerator, thus slowing the generator, and reducing the voltage of the main current before circuit is broken. An interlocking device connected with the foot switch, prevents the raising of the pedal to its full height except when the controller lever is in either the forward or reverse position. In addition to this, the engine is governed automatically, to prevent racing, or throttling below a certain minimum speed. A throttle lever is mounted on the steering wheel in addition to the lever controlling the position of the rheostat, which is used in conjunction with the foot accelerator.

By virtue of the arrangement of parts employed, it is possible to gain access to any of the important organs of the transmission at any time without stripping down the chassis or running it over a pit. The motors, in particular, being mounted on the outside of the frame, are in a thoroughly accessible position, while the generator may be got at by merely raising the foot board in front of the driver's seat. Further than this, the use of independent drivers for each of the rear wheels, does away with the requirement of a mechanical differential, as is the case with any double motor electric system, but in addition to this, the manner of placing the motors, renders the rear axle essentially simple, and affords a high gear ratio with that most desirable of all features, a silent drive.

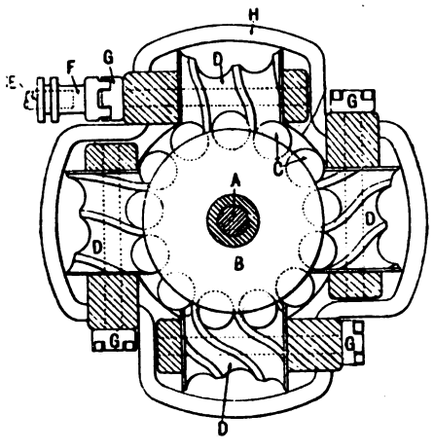
WHEN GREASE IS NOT A LUBRICANT

Resistance It Offers When Stiffened by Low Temperature—Evils that may Result Under Such a Condition.

Safe to say the average motorist has absolutely no comprehension of the amount of resistance offered by a bearing which commonly is lubricated by grease or so-called "hard oil," when the atmospheric temperature is so low as to cause the grease to stiffen perceptably. Instead of acting as a lubricant under those circumstances, the grease actually increases the natural resistance due to the load on the bearings to a degree which at times throws strains on the mechanism which are a menace.

In the case of counter shaft bearings, for instance, where the possible addition to the regular load which might be brought about in this way is comparatively slight, there is little possibility of harm from this cause. But where sliding gearsets are packed in grease, the very attempt to move one of the sliding groups in order to start the car may be sufficient to spring the connections between the gears and the hand lever of a poorly constructed car, causing the interlocking mechanism to prevent the clutch from being fully seated, or even preventing the gears from meshing sufficiently to secure enough tooth surface in contact to prevent stripping.

In the same way, where grease is used in bearings which are placed at some little distance from the grease cups, there is danger that cold weather may make it practically impossible to force the lubricant through to its destination, turning down the feed screw on the cups simply serving to force the grease past the plunger into the upper part of the chamber and effecting no more useful purpose. In fact, this is one of the greatest drawbacks to the use of grease in cold weather, and not even the tendency to warm the supply slightly as a result of the undue friction set up is always sufficient to ensure perfect lubrication. For generally speaking, the heat so generated is purely local and while sufficient to soften the grease in the immediate neighborhood of the bearing, has no effect on any which may be located in oil-ways or pipes distant only an inch or so away.



On this account, it is well to be particularly watchful of all parts of the machine which are dependent on grease for lubrication during the cold weather. When the machine is habitually kept in a heated room when standing idle, there is little or no danger of trouble arising on this score. But when permitted to remain in the cold for any length of time, there is a chance that abrasion may occur in the bearings, or that some of the more delicate parts may be sprung. unless care is taken in handling the machine until thoroughly warmed up.

INTERCHANGEABLE WORM DRIVE

Speed Ratio Altered by Varying Number of Threads on Spiral—Individual Clutches for Effecting Changes.

In connection with the development of the worm drive for motor vehicles, which has been in use by a few makers for several years, a number of attempts have been made to produce a method of speed changing directly adaptable to the worm, thus doing away with the usual gear box and placing the bulk of the transmission on the rear axle. Thus far, these efforts have resulted only in the production of mechanical curiosities. Recently a foreign inventor has added a new system to the list, which hard-

ly appears to be practical, though its ingenuity commends it to notice.

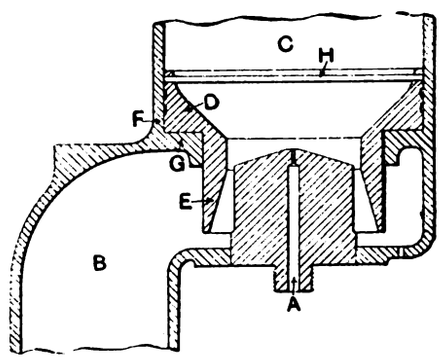
The plan is to employ four worms, all held constantly in mesh with the same gear wheel, the latter, instead of being of the solid type with cut teeth, carrying a series of balls embedded in its surface, which fit into the helical grooves of the worms. Naturally these are all of the same pitch, but by employing one single, one double and one triple thread, the thread angle is varied sufficiently to secure three different ratios of transmission, according to the selection of one or another of the worms as the driver. The fourth worm is single threaded, but is pitched oppositely to the other three, thus affording the reverse movement. Each worm is mounted on a short shaft and carries a jaw clutch integrally mounted with it and adapted to lock with a master clutch when thrown into the driving position.

The accompanying illustration gives a fair idea of the method of mounting and the system used in changing gear. The driven shaft, A, carries the wheel, B, with the ball teeth, C, and is surrounded by the casing, H, which carries the four worm shafts, D, with the clutches, G. The driving shaft, E, carries the clutch, F, which may be engaged with one of the clutches, G. To effect the changes of speed, the casing which is at once, gear housing and carrier for the worms, is partially rotated about the driven shaft, so that the desired worm is brought into the upper horizontal position. When so placed, the clutch, G, may be engaged and the drive established by means of the usual master clutch.

Electric Differential in Mixed System.

Among the new machines employing the electro-mechanical transmission, of which several have been brought out within a year, the system of the Ampere car, one of the brand new French productions, should not be overlooked, because it embodies not simply a multiple adaptation of the magnetic clutch principle, but also extends the same scheme to the differential provision for the rear wheels, which is controlled not mechanically, but electrically, and in proportion to the deflection of the steering wheels. It is in no sense of the word a gearless car, since the ordinary form of transmission is employed, practically in its entirety. The novelty consists in the application of individual electro-magnetic clutches, in place of the usual sliding pinions, all gears being in continuous mesh.

Permanently attached to each driving gear in the change gear group is a magnetic disc, adjacent to which is a magnetic clutch, splined to the shaft, but free to slide upon it for a certain distance. Whenever the field of either of the magnets is excited by directing the master current through it, the effect is to lock the corresponding disc to it, much as a keeper is locked to a horseshoe magnet, thus fixing the gear to the shaft, about which it is otherwise free to revolve. In this way the changes of speed are all effected by manipulating the small switch mounted above the steering column.



The most unique provision of the system, however, is that corresponding to the differential. Each wheel is mounted loosely on the end of the solid, live rear axle, and carries a disc, similar to those employed in the gearset. A magnet, also similar to those in the gearset, is mounted on the end of the axle adjacent to the disc, and the flow of current through it is controlled by the movement of the steering wheel in such a way that whenever the front wheels are deflected, the driving wheel which has the shorter turning radius is released, the other being held in fixed relation to the axle. In addition to this, whenever the brakes are applied, the current through the rear clutches is discontinued, and liability to skidding is therefore largely abolished.

The controlling current, which here serves merely the purpose of a connecting, rather than a driving medium, it will be observed, is derived from a special form of magneto, mounted on the engine. By an ingenius disposition of the windings, two currents, at varying potentials are generated, one of which is used for igniting the gas in the cylinders, and the other in controlling the transmission. The system is the product of the Société Etablissements Ampère of Billancourt, France.

SIMPLE AUTOMATIC REGULATOR

Quality of Mixture Controlled by Differential Piston—Improvement Effected by Change in Carburetter.

So general is the apparent tendency to increased complication both as to construction and number of parts in the matter of carburetter design, that it is really noteworthy when a fairly simple idea is fixed upon which bears the ear marks of apparent suitability for the purpose. Thus, the Jobling carburetter, which is here illustrated, contains the germ of the true automatic type in which regulation is affected by varying the quantity of air drawn over the fuel jet, a strangling or dash-pot action for preventing rapid fluctuations in the qual-

ity of the mixture, and has the further recommendation of possessing but a single moving part—itself composed of but one piece.

The arrangement in question contemplates the use of the ordinary system of float regulation and a plain jet around which the air current rises as in the simplest form of carburetter. The distinguishing feature of the jet is that its body is much larger than is ordinarily the case, the outside of the jet, together with the inside of the single sliding regulator, forming the air passage. This organ takes the form of a differential piston which is hollow. The lower extension is made not simply to reduce the area of the passage surrounding the jet, but also to partially cut off the entrance of the air to the passage. The upper portion of the valve fits the delivery passage closely and by virtue of the shoulder against which it fits, acts as a sort of suction dash pot to check its movement.

From the illustration the arrangement will be perfectly evident. A is the jet through which the fuel is drawn by the suction of the motor, which also lifts the air through the air port, B, to the reduced area, E, around the jet. The delivery port is directly above through C, while the shoulder, G, in the wall, F limits the travel of the valve, D; H, is a wire placed across the valve and used in removing it from the chamber when cleaning or repairing.

MODIFICATION OF THE SUSPENSION

Two New Systems Using Supplementary Springs—Vertical Thrust Transformed into Horizontal.

Notwithstanding the great popularity of the so-called shock absorbing devices, it is evident that the use of supplemental springs is constantly growing more pronounced. While the end sought is the same in devices of both types, the method is distinctly dissimilar. With the shock absorber, the plunging action of the springs during the period of recovery from the initial deflection is checked by direct braking action. The supplemental spring, on the other hand, because of its inherent properties, serves to interrupt the oscillation of the main springs, by interference of vibrations. There are various ways in which this object may be effected, such as the use of helical springs in conjunction with the usual elliptical members, the use of scroll-end full elliptical springs, in which the members have different periods of vibration, and also certain systems of equalization by means of coupling bars, which in possible adaptation offor a very wide range of plausible practice.

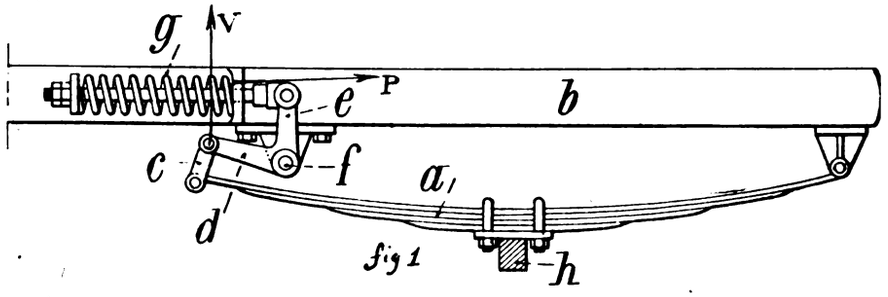

fig 1

In connection with the latter principle it is instructive to consider a couple of recent French designs, which, though quite similar in spirit, yet differ in mechanism to a significant degree. The first, which is known as the Demerliac suspension is capable of two possible variations in arrangement. The principle upon which the system is based depends upon the fact that the reactions of the ordinary suspension are vertical in direction, and that however much they may be dampened or partially surpressed, they still act as vertical thrusts which appear to the passenger in the form of distinct vibrations. The object of M. L. Demerliac in designing the system under discussion was merely that of converting these oscillatory thrusts into horizontal instead of vertical impulses.

As shown in Fig. 1, the laminated spring, a, instead of being linked directly to the frame by means of the ordinary shackles, is connected to a bell crank lever, e-d, pivoted about the fixed point, f, where it is attached to the frame. The horizontal arm, d, is linked to the end of the main spring, while the vertical arm is connected to some horizontal elastic medium, g, attached at m, to the chassis. The elastic medium may be of any sort desired, so long as its position is horizontal. In use, when the axle, h, is raised by an obstruction in the road, the main spring, a, is compressed, its extremities thereby receiving a vertical reaction, which, in the case of the bell crank, connection at d, is transformed into a horizontal motion, absorbed and resisted by the spring, g. This thrust, being horizontal, has no appreciable effect on the occupants of the machine, according to the theory of the invention.

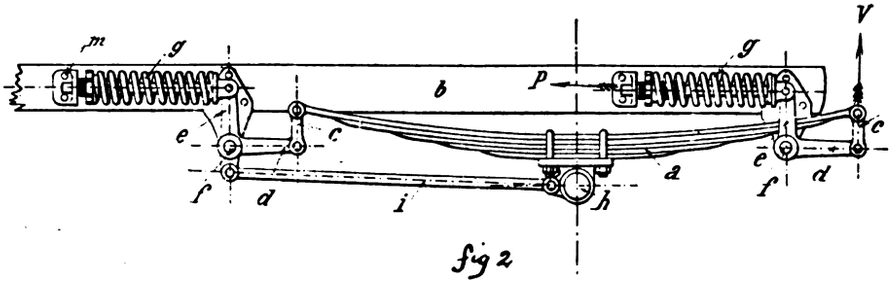

fig 2

In Fig. 2, the same principle is shown as applied to both ends of the main spring, instead of to one end alone. Both balancing members are made to "look" in the same direction so that the resulting horizontal reactions are both toward the front of the vehicle. It is evident that by reversing one of the connections and adapting such an arrangement as is shown in Fig. 1, it would be possible to equalize these horizontal forces. Here the reactions on the pivot points supporting the bell crank levers on the frame would tend to counteract each other in some measure, thus partially neutralizing the lifting tendency at those points. Total transformation of all vertical forces into horizontal, is absurd.

The second system, which is known as the "B. C.," is designed in accordance with practically the same principle as the Demerliac, except that the secondary springs are vertical instead of horizontal and the connection is by means of a straight lever instead of the bell-crank arrangement employed in the latter device. Each extremity of the main spring is connected to a balancer which is pivoted about a point of support on the frame. In each case the opposite end of the balancer is attached to a helical spring, mounted on a rod, which also is connected to the frame.

Thus, when the axle is raised by an obstacle in the road, the compression of the main spring produces a vertical reaction in each of the end connections, which serves to displace the balancers, l-l, which pivot about the points, o-o, and cushion against the helical springs, r-r, which through their connection with the chassis, take up the reactions in a suitable manner. The oscillation of the body over the axle is thus divided between the main spring and the two supplementary ones, exactly as with the supplementary springs, commonly employed in this country, while the difference in time of the natural vibration of the two sets, serves to dampen automatically any tendency to surging which may arise from the inertia of the body. The introduction of any linkage, tending to complicate the suspension, is, of course, distinctly a disadvantage. At the same time it is questionable whether some method more or less akin to the foregoing, is not entirely justified under the circumstances.

MOTOR 'BUS BOOM SHRINKING

Unfavorable Results of Foreign Mnuicipal Experiment—Some Causes and Their Suggestions for the Future.

As an inevitable result of the tremendous boom which the motor omnibus has suffered in England during the last two or three years, more or less of a reaction is setting in, governed largely, it is safe to assume, by the rapid falling off in stock values. In some instances also, the first equipment has not been maintained properly, and has now reached a point where a complete and thorough overhauling is required, and at an expense which has not been reckoned with hitherto. In this way a number of discouraging reports are heard from time to time, which are in marked contrast to those from other quarters where the business has been managed on more conservative lines.

The municipal experiment of the city of Nottingham, is a case somewhat in point. After two years of operation of three 'buses which formed the experimental equipment, a report has recently been made which is distinctly unfavorable to the new method of traction. The vehicles have been run in a portion of the town not served by the street cars, and have not even paid expenses. The receipts per vehicle mile for the streets cars amounted to 25 cents on the average, against an average of 20½ cents for the 'buses. The working costs of the streets cars, on the mile basis amounted to 14½ cents, while those of the 'buses are not given in the official report. The total receipts of the experimental vehicles during the second year, were, however, $1,263 more than the total receipts for the same period. This, of course, is construed into a complete indictment against the motor vehicle in this case, and is likely to be held up as a fair example in others where the possible adoption of the system is under discussion.

Without fuller particulars as to the exact traffic conditions in the section served by the motor vehicles, it is impossible to question the justice of the report. But it is well known that vehicle-mile and load-mile figures are not invariably as representative as they purport to be, and that the success or failure of any method of transportation in one locality, is not proof positive of its inherent qualifications. The point is that the boom period being passed in England, so far as the motor 'bus is concerned, that vehicle must now do battle to a vast amount of adverse criticism, which is not always as unbiased as it appears. Transportation interests are well grounded and slow in giving up their prerogatives. Schemes which are prey to the fluctuations of the stock market are equally apt to suffer with those fluctuations. The complaints of the noise, and speed, and skidding of the motor vehicle are as nothing compared with the apparent logic of unfavorable statistics coming from apparently disinterested sources.

An exactly similar situation is due within a year or two in this country, not with the omnibus, but with the taxicab, which just now is subject to so much inflation. It is a condition which nothing can prevent and which is practically certain to come. In its effect on the real service of the motor vehicle to the public, such a reflex of sentiment is only temporary, but at the same time, its influence on the market and the industry, even though temporary, is apt to be of some little consequence. Only one policy can be held to offset its effects, moreover, and that is one of conservatism in investment and patience in awarding judgment until such time as the boom period, or such conditions of novelty as might foster it are passed.

Municipal Motoring Minus Graft.

Patrolman Bauer, of the Roslindale substation, West Roxbury, Mass., does not fear investigation of his methods of using municipal automobiles. Patrolman Bauer employs a little runabout that has been in continuous use since 1905, and during that time it has covered 33,384 miles during its trips through Jamaica Plains and West Roxbury, the territory to which it was confined. In 1907, 9,251 miles were recorded; 11,627 miles in 1906, and 11,264 miles in 1907. During January, 1908, the odometer registered 1,242 miles. Its service has been nearly as varied as that of the policeman who acts as chauffeur. It has taken rush trips to fires, investigated police court cases, played the part of an ambulance, and given first aid to the injured by conveying them to their homes, and has even broken up street fights. During 1906 it was out 234 days, and in 1907 219 days.

Proposed Letup in Gasolene Restriction.

One of the automobile measures now before the Massachusetts legislature provides for the amendment of the law relative to the storage of explosives and inflammable fluids so as to exempt gasolene tanks in automobiles from its provisions. It would add to the law a new section, as follows:

"The provisions of this act shall not be construed to apply to the keeping or storage of gasolene in tanks or receptacles forming parts of automobiles."

This bill was introduced on petition of William A. Thibodeau and George L. Ellsworth, and is at present in the hands of the committee on legal affairs, which has given a public hearing on the matter.

Taxicabs for the National Capital.

Washington, D. C., will have a taximeter motor cab service beginning March 1st Robert A. Parke, manager of the cab department of the E. R. Thomas Motor Co. has been in Washington perfecting arrangements for the establishment of the service there. The name of the company, it is stated, will be either the Washington Taxicab Co., or the Thomas Taxicab Co.

FIGHT AGAINST THE WHEEL TAX

Chicago's New Ordinance to be Attacked as Unconstitutional—Chief Weapon a Former Court Decision.

Injunction proceedings will be instituted at once against the city of Chicago by the Chicago Motor Club to prevent the municipal authorities from carrying out the provisions of the wheel tax ordinance, passed by the city council last week. The club's attorney is preparing the papers for the fight. All the automobiling organizations of Chicago are united in contesting the new ordinance which, it is asserted, is directly contrary to decisions of the Supreme Court of Illinois.

The wheel tax ordinance passed by the Chicago council, provides that the following license fees be paid yearly by all vehicles using the streets of Chicago:

One-horse wagon or vehicle	$5
Two-horse wagon or vehicle	10
Three-horse wagon or vehicle	15
Four-horse wagon or vehicle	25
Six or more horse wagon or vehicle	35
Automobiles with seats for two persons.	12
Automobiles with seats for more than two persons, exclusive of trucks, coaches and buses	20
Automobile trucks, coaches and buses	30

In its assault upon the constitutionality of the wheel tax ordinance the Chicago Motor Club will use as its chief weapon the decision of the State Supreme Court in the case of the City of Chicago vs. Collins, several years ago, when an attempt was made to tax bicycles. The Supreme Court ruled that the use of the streets is not a provilege of the citizen, but his alienable right, which no municipality has a right to tax.

In view of its bearing on the present case the following excerpt from the Supreme Court's decision in the Collins case is not untimely:

"The right of the public to use the streets is the right to use them for purposes of travel in the recognized methods in which the public highways of the State are used. Any method of travel may be adopted by individual members of the public which is an ordinary method of locomotion, or even an extraordinary method, if it is not, of itself, calculated to prevent a reasonably safe use of the streets by others. If a right exists in a city council to impose a license fee, by way of tax, upon every person using wheeled vehicles thereon, it may, in like manner, impose such license fee for such use of the streets in every other manner of locomotion or travel and reach the man on horseback or the pedestrian walking along the same. . . . . Anything which cannot be enjoyed without legal authority would be a mere privilege, which is generally evidenced by a license. The use of the public streets of a city is not a privilege but a right. A license, therefore, implying a privilege, cannot possibly exist with reference to something which is right, free and open to all, as in the right of a citizen to ride and drive over the streets of the city without charge, and without toll, provided he does so in a reasonable manner."

The Week's Patents.

872,808. Shock Absorbing Device for Vehicles. Claud H. Foster, Cleveland, Ohio. Filed Dec. 14, 1905. Serial No. 291,704.

1. The combination, with the body and axle of a vehicle, of a dashpot comprising a cylinder supported by the axle and a piston therein, a rod for said piston having at its upper end a bracket, a pin carried by said bracket and a plate or member carried by said body and provided with a slot for the reception of said pin, said slot being elongated longitudinally of the vehicle, substantially as specified.

872,836. Vehicle Wheel. Tod J. Mell, Youngstown, Ohio, assignor to The Republis Rubber Company, Youngstown, Ohio, a Corporation of Ohio. Filed May 17, 1906. Serial No. 317,369.

1. In a circumferentially divided wheel rim, the combination with separable sections, of a spring locking ring having cooperating inclined faces for drawing and securing said sections together, substantially as described.

872,860. Vehicle Tire. William C. Taylor, Paris, France, assignor of one-half to Clarence G. Taylor, Washington, D. C. Filed Feb. 20, 1907. Serial No. 358,431.

1. In combination with a rim; a plate carried thereby, said plate being provided with numerous perforations throughout its length and breadth; a pneumatic tire mounted upon the rim over said perforate plate; and means for admitting air to the opposite side of the plate.

872,877. Vehicle. Zephaniah E. Williamson, Sheffield, Ill. Filed May 9, 1907. Serial No. 372,693.

A vehicle of the class described having a frame projecting from the front end of its body and provided with a transversely disposed guide-way, a tongue pivotally connected to an axle of the vehicle and bearing and disposed to travel in said guideway, a steering shaft mounted in the body of the vehicle, having a steering wheel at its upper end and a sprocket wheel at its lower end, direction sprocket wheels mounted in the said frame at points at opposite sides thereof, and a sprocket chain engaging and connecting the sprocket wheels, the sprocket wheel at the lower end of the steering shaft and also connected to the tongue to move the latter in the guide way, for the purpose set forth.

872,881. Drive Mechanism for Motor Vehicles. Adam Ziska, Jr., Chicago. Ill., assignor to Rockford Automobile & Engine Co., Rockford, Ill. Filed Nov. 24, 1906. Serial No. 344,936.

1. In a motor vehicle, the combination of a motor operated drive wheel having a friction face, a pulley having a peripheral friction surface, a shaft on which the pulley is mounted operatively connected to the pulley, means for adjusting the shaft to vary the line of engagement of the friction surfaces of the drive wheel and pulley and means for adjusting the pulley to engage the face of the drive wheel at different points along said line to vary the speed of the pulley.

872,952. Variable Speed and Reversing Gear. Franz Markgraf, New York, N. Y. Original application filed Feb. 11, 1903. Serial No. 142,974. Divided and this application filed Dec. 15, 1904. Serial No. 236,950.

1. In a variable speed mechanism, in combination, a shaft, a plurality of gears of varying diameters fixed thereon, a second shaft, a plurality of gears slidably mounted thereon and adapted to mesh with said first mentioned gears, means adapted positively to throw said second mentioned gears into mesh with said first mentioned gears and to throw some of the gears out of mesh without breaking connection between all the gears, a lever controlling said means, and cushioning means interposed between said throwing means and said lever.

872,999. Power Transmitting Mechanism. Gittfried Malburg, Cleveland, Ohio, assignor of three-fourths to A. A. Maresh, R. J. MacKenzie, Theo Hanks, Frank McHale, and Fred Matthews, Cleveland, Ohio. Filed Dec. 24, 1904. Serial No. 238,204.

Power transmitting mechanism comprising the combination of a frame, an engine mounted on said frame, a gear wheel secured on the engine shaft, a shaft arranged at a right angle to the engine shaft, a gear wheel mounted on said last mentioned shaft and arranged to mesh with the gear wheel on the engine shaft, two wheels rigidly secured on said last mentioned shaft, boxes rotatably mounted on said wheels, levers fulcrumed in said frame and having their ends extending into and arranged to slide freely in the respective boxes, sleeves arranged on the opposite ends of said levers, means for sliding said sleeves in and out on same, means for locking said sleeves in their adjusted positions, a driving shaft, drums mounted on said driving shaft, a cable connecting each drum with one of said levers so that the movement of said levers in one direction will cause a rotary movement of said drums in one direction, automatically operating clutches arranged to lock said drums to said driving shaft when said drums are rotated by the movements of said levers, and springs for rotating said drums in the opposite direction to that in which they were rotated by said levers, substantially as described and for the purpose set forth.

873,016. Pneumatic and Solid Tire for Vehicle Wheels. James Burnham, London, England. Filed Jan. 28, 1907. Serial No. 354,563.

1. The combination of a wheel, a band on the exterior thereof having side flanges of unequal height, one of said flanges being notched and the other slotted, of a tire rim carrying a tire and provided with internal projections of substantially the same size as said notches, and wedges fitting in said notches, substantially as described.

873,047. Automobile Wind Shield. Stephen D. Hunter, Philadelphia, Pa. Filed July 11, 1907. Serial No. 383,272.

1. A wind shield for automobiles comprising a two part frame and two pairs of tubes between which the frames are respectively supported, plugs secured within the tubes of the lower frame and provided with threaded sockets having conical outer seats, and pins extending through the tubes of the upper frame, said pins having contracted threaded ends and tapered shoulders at the junction of their bodies and said contracted threaded ends, said contracted threaded ends and tapered shoulders being adapted to respectively engage the threaded orifices and conical seats in said plugs substantially as described.

873,092. Coupling Rod for the Axles of Automobiles. Theodore Rommel, Neuilly-sur-Seine, France. Filed Sept. 6, 1906. Serial No. 333,458.

1. The combination with a vehicle frame and wheel axle of a coupling or tension rod adjustable as to length and having a non-displacable connection at one end to said frame, and a spring connection between the other end of said rod and the wheel axle aforesaid substantially as described.

873,102. Clutch. William W. Sly, Cleveland, Ohio. Filed June 21, 1907. Serial No. 380,070.

1. The combination of a shaft, a rotative member thereon having an annular flange, a clutch lever supported on the shaft and having a pivot head with a slot therein through which the flange extends, and means to operate the lever to bind the flange in the slot.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

WANTED—A man calling on the automobile manufacturers, to sell on commission the best article of its kind made. To the right party—one who can show results, an interesting proposition will be made. All replies held in strict confidence. Address P. G., care Motor World Pub. Co., Box 649, N. Y.

FOR SALE—$100 to $500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from $640 to $1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets or the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

One Price for Warner Auto-Meters

NEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out — that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

Triumph Grease, What Is It?

¶It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. ¶We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. ¶It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. ¶A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. ¶It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. ¶Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company, South Bend, Ind.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN

Type D Touring Car, $2,850.

You want your motor-car for keeps.

You want it to go on giving good service year after year. You don't want to find yourself next year with an over-weighted expense-breeding relic on your hands.

You want an automobile so well built that a season's use will only make it run smoother and easier; so far advanced that time will only bring other makes nearer to it in design; so graceful an modish that in spite of changing fads it will still be smart and in good form.

Over 5,000 Franklins are in active use—many of them 5 years old. The first Franklin ever made is still giving good service. How many 5-year-old automobiles of other makes do you see in use to-day?

Demonstrations by appointment. Any Franklin dealer will gladly show you. An hour's ride will tell you more than we could describe in 100 pages.

H. H. FRANKLIN MFG. CO., Syracuse, N. Y.

SPRINGS

CLEVELAND-CANTON

Vanadium Anti-Fatigue

alloy steel gives the maximum of elasticity, tensile strength and stands up under continuous shocks and stress reversals far in excess of anything yet discovered. Where drastic conditions are encountered, there Vanadium is at its best.

Automobile Springs

that will not permanently set, that are resilient and will carry on overload without breakage are not easy to find. We make them. The fitting is done by a patented high-pressure roller used exclusively by us, and every spring is carefully tested in powerful machines before leaving the factory. We believe we can be of assistance to every automobile builder in working out the "spring problem."

Our services for the asking.

A Car On Crutches!

A Car limping there—and limping back, has but one thing the matter with it—a lame, crippled Ignition System.

The Battery Witherbee Means Perfect Ignition

Means new life to your car; means less cost for "up-keep." Get there and back without the limp. Equip your Car with the Witherbee and throw away your crutches.

The consistent performance of the battery Witherbee, has so standardized this product that it is included as part equipment on the greater majority of motor cars manufactured in this country.

In writing Department 20 for battery catalogue please request Wico Spark plug literature and mention Motor World.
